IT has been suggested that the probable source of the extensive colemanite veins found at Borate, in the eastern end of the Calico mountains, San Bernardino county, Cal., are the result of emanations of boric acid from hot springs and vents, which existed in the floor of the Tertiary lake bed at that time. The occurrence of borate springs in Tuscany, Italy, gives color to this theory. The existence of hot springs in the Calico region, both before and after the eruption of the rhyolites, andesites and other lavas, is in evidence in several places.

THE rock generally recognized as the footwall of the Comstock lode at Virginia City, Nev., is diorite, and it has no immediate connection with the bonanza ore bodies, these occurring some distance to the eastward

and usually standing at a high angle. While the pitch of the footwall is about 45° to the eastward, some of the bonanzas were vertical or even had a slight westerly dip. The bonanzas usually occurred as segregated masses of rich ore in very large veins or deposits of low-grade quartz which dipped, in a general way, with the formation. Much of the so-called low-grade quartz remains in the mines and contains from \$2 to \$10 per ton in gold and silver.

DREDGING OPERATIONS may be carried on at any altitude where men may work, and where the conditions make this kind of mining permissible. The dredgers of California and New Zealand are operating at only a few feet above sea level—those in California, for the most part, in broad, flat valleys, and those of New Zealand in some instances in comparatively narrow gulches or canyons. At Breckenridge, Colo., the dredgers are working at an altitude of about 9500 feet above sea level. Steam shovels have also been operated on dry gravel in San Bernardino county, Cal., but work was suspended owing to small gold content of the material handled and scarcity of water to wash the gravel.

WHEN A. hires B. to work for him and B. discovers a mineral deposit, or vein of value, on the public domain, B. may claim and hold such discovery, and in it A. has no interest whatever unless it had been distinctly understood and agreed that B. was to prospect in their common interest. This would be similar to the grubstake partnership. Recently a case was decided wherein a mine superintendent located a claim adjoining the one he was working for his company, in the belief that the ore shoot he was developing extended into the adjoining ground. He developed the new claim and found the extension of the new ore body as he had expected. The company claimed the discovery on the ground that the discoverer was in the employ of the company at the time of making the discovery and that this was predicated upon knowledge obtained in the company's mine and at the expense of the company. The court held that the relations between the company and the superintendent were not of a fiduciary nature and therefore the company was not entitled to any interest in the discovery made by the superintendent.

REDUCTION FURNACES are of three general types: The stack, or cupola furnace, in which the ores, fluxes and fuel are mixed in certain proportions; the reverberatory furnaces (and the rotary type), in which the ore is calcined or roasted by flames, but in which they do not come in direct contact with the fuel, and the retort in which the material is to be treated by a process of distillation. The first kind are found represented in the iron, copper and lead water-jacketed stacks. The reverberatories are employed for roasting, matting, etc. In addition to the reverberatory, of which there are numerous types, having single, double and multiple hearths, may be included the various rotary furnaces of the White-Howell and Bruckner type, and also the Stetefeldt. In each of these furnaces the ore, usually pulverized, comes in contact with the flames, but not with the fuel. Retort furnaces are employed in the reduction of high-grade quicksilver ores, zinc ores, etc., the latter of several special designs. Each of the above are built in a great variety of size and form. Some are better adapted to certain purposes than others. Those of the larger sizes are usually more economical than the smaller ones, but in the matter of size alone can be carried to a point beyond the economic limit of successful operation.

UPON the relocation of a mine when the former proprietor has failed to perform the assessment work required by law, it has been held by various courts that machinery such as engines, boilers, compressors, hoisting works, mills, pumps and other things of like character "annexed to the soil" for mining become part of the freehold (Meritt vs. Judd, 14 Cal., 60. Treadway vs. Sharon, 7 Nev., 37), and as such they pass to the relocater. But says Lindley on Mines, "while this is undoubtedly true, upon application for a patent the relocater will not be permitted to include in his estimate of the value of improvements required by law to be made as a condition precedent to patent any of the labor done or improvements made by the original locator. A grant from the original locator to one who has already effected a valid relocation is ineffective for this purpose. Expenditures for such purpose must have been made by the relocater or his grantees (Rev. Stat., Sec. 2322)." An original locator may not locate a mining claim basing his act upon his own failure to perform the necessary assessment work. One may locate a claim, say in 1895, and perform the assessment work (\$100 worth) annually each year up to 1902. During 1903 he does no work, but on Jan. 6, 1904, he relocates the claim and in April has the claim surveyed for patent. The locator has already performed \$500 worth of work on the claim, and the query is, will this work apply as the work necessary to be performed in securing a patent. "Concentrates" is of the opinion that it will, for, although as stated above, "an original locator may not relocate his own claim, etc.," he has a right to enter and resume work on his own claim prior to relocation by another, his estate in the claim under the first location not being wholly lost by failure to do the work. The Supreme Court of Colorado in this connection has said: "As between the locator and the Government the failure to do the annual assessment work does not result in a forfeiture. In other

words, it is not necessary to perform the annual labor except to protect the rights of the locator against parties seeking to initiate a title to the same premises. \* \* \* To otherwise express our views, it might be said that after a valid location the title thus acquired remains so, whether the annual assessment work is performed or not, until forfeited or abandoned (Beals vs. Cone (on rehearing), 27 Colo., 473—82 Pac., 948-958). Forfeiture is not complete until some one else has appropriated the property (McCarthy vs. Speed, 11 S. Dak., 362—77 N. W., 590-593)." In view of the above the relocation made under the circumstances would be invalid and may be set aside, the claim holder proceeding to patent under the original location of 1895.

THE amount of coke to be used in pyritic or partial pyritic smelting cannot be predetermined, as it varies with the condition of the furnace—which cannot be kept constant even with a constant grade of ore and the same fluxes. It is easy to use too much coke. The result of heavy overcharges of coke is generally the driving of the fire upward, and the accumulation of a small amount of slag with no metal at all. Peters mentions an instance in Arizona where the furnace was in bad condition; the slag only red hot, and scanty, and apparently very siliceous. All of the ten tuyeres had long noses that united in the center of the shaft, and through which not the feeblest glow of heat could be seen. The charge sank very slowly and irregularly, and the water in the jacket was almost boiling, though a full supply was flowing through the feed pipe. He further says: "If the furnace had been a small one it could scarcely have been saved, but it requires a considerable amount of time, as well as metallurgical skill, to freeze up one of the long, rectangular shafts now in such common use." Every alternate tuyere was plugged, the blast reduced, the coke charge was maintained at 300 pounds, but instead of small charges of ore such as had previously been fed, they charged 3000 pounds of old ferruginous slags. These were continued for five charges, when one-half of the slag was replaced by ore, and later ore was gradually substituted for the remaining slag, at the rate of 40 pounds of ore for 100 pounds of slag, so that the normal charge became 2100 pounds of ore to 300 pounds of coke, with the addition of a small amount of foul slag made by the furnace. After several hours, the tuyeres began to brighten, one by one, and after a time the running of furnace became normal. The ores were oxidized. With sulphide ores the amount of coke used is much less than with oxidized ores, as the sulphur of the ore supplies a large amount of the necessary fuel.

UNDER the general name, mica, is included a number of minerals which have a highly developed basal cleavage. On the basal section, all of them show plane angles of 60° or 120° marking the relative position of the principal zones of forms present and giving them the appearance of hexagonal or rhombohedral symmetry. Muscovite, the common mica, or "islinglass" of commerce, is an essential constituent of mica schist, and certain varieties of granite and gneiss, but its largest and best developed crystals are found in pegmatite dikes. In such cases it sometimes occurs in plates up to 12 to 15 inches across. It is used in stoves, and other work, and is largely used in electrical work for insulating purposes. Muscovite is usually light colored or colorless, and the thin laminae are tough, flexible and elastic. It is difficultly fusible, not decomposed by acids, and in composition is a potassium, aluminum silicate. Sericite is a fine, scaly muscovite united in fibrous aggregates and having a silky luster. Biotite is a green to dense black mica, sometimes opaque, even in thin laminae. It occurs commonly in certain varieties of granite, syenite and diorite, of massive granular type, but not developed to as large plates as muscovite. Phlogopite is a magnesium mica, usually brown in color, containing little iron, while biotite has a large percentage of iron, as well as magnesium. Lepidolite is a lithium mica, color rose-red, violet-gray or lilac. It is used as a source of "lithia," which is employed in certain medicines. Under the head of the true micas are also included damourite, margarodite, gilbertite, paragonite, zinnwaldite, caswellite, lepidomelane, alurgite (of manganese), roscoelite (of vanadium). The mica division of minerals is divided into three groups—the micas proper, the clintonite or brittle micas and the chlorite group. The members of the clintonite group are considered in composition a transition from the micas proper to the chlorite group, and includes margarite (calcium mica), seyberite (or clintonite), xanthophyllite, and chloritoid (of iron and magnesium). In color, margarite is grayish to yellowish; seyberite is reddish brown to copper red; chloritoid is dark gray to greenish black. This group is marked physically by brittleness of the cleavage plates and chemically by basic character. The chlorite group includes clinocllore, penninite, prochlorite, thuringite and minor varieties. The color is commonly green, due to ferrous iron and the laminae tough and comparatively inelastic. The chlorites occur largely as secondary rock-forming minerals resulting from alteration of ferro-magnesian silicates, as hornblende, biotite and pyroxene. The vermiculites include several micaceous minerals, alteration products of the micas, biotite, phlogopite, etc., having soft, pliable and inelastic laminae, and color white to yellow and brown. If a blow be struck with a dull pointed instrument on a cleavage face of one of the micas, a six-rayed star, called the "percussion figure," results. Mariposite is a green mica of complex chemical composition, the color being due to chromium.

## The Father Lode of California.

[FROM A STAFF CORRESPONDENT.]

The importance of the effects of physiography in mining has long been understood, but the absolute dependence, not only of the methods of working, but also of the very discovery of the mines, upon the physiographic condition of the country is seldom better exemplified than in the northeastern mining counties of California.

The geological history of the region has been complex, and represents a long period of marine sedimentation succeeded by uplift and intrusion by various plutonic rock masses. Then ensued periods of erosion, the effects of which were mantled by various volcanic flows. Further lapse of time reduced the country to a peneplain, which, being upraised, forms the present Sierra Nevada mountains. In recent times this peneplain has been dissected by erosion into deep canyons with high ridges between.

The importance of this stream erosion in revealing the ancient gold-bearing river channels has long been appreciated and commented upon, but the almost equal importance of disclosing numerous quartz veins, the possible source of the placer deposits, has received less attention.

The region under special discussion embraces eastern Nevada county, northeastern Placer county and southern Sierra county. The eastern portion of these counties consists largely of intrusive granite. West of this lies an area of schists and slates of 6 miles average width. This in turn is bordered on the west by a continuous ledge of serpentine, probably metamorphosed from the old basic plutonics on the west. While the granite and serpentine on either side of this slate belt contain gold, yet special attention is here to be called to the economic value of the deposits in this belt of slates.

This belt consists largely of clay slates; black and fissile, and of a fine-grained, dark green sandstone containing abundant quartz grains. The strike is north-south, and the dip is characteristically to the east, but is reversed in many instances, giving evidence of much movement. The angle of dip is very high, being seldom less than 75° and is often vertical. These slates are probably of Carboniferous age.

The broad belt of serpentine, already mentioned as lying west of the slates, extends almost continuously from northern El Dorado county, through Placer and

In the first place no elaborate and expensive hoisting works are necessary. The veins may be worked rapidly and economically by crosscutting and drifting. The ore can be readily trammed to the mouth of the tunnel and run to the mill by gravity. There is no difficulty in finding suitable millsites on the canyon sides with good foundations and ample fall. There is an abundance of dump room. The ridges and slopes are covered with a luxuriant growth of timber, chiefly yellow and sugar pine, together with spruce and fir, which insures an ample supply for underground timbering. Water power is cheap and abundant, and converted to compressed air or electricity, forms a convenient agent for milling and mining. The application and utilization of these advan-

Nevada counties into Sierra county. It occurs with old basic rocks, probably intrusive, in the Carboniferous slates, and is possibly derived from peridotite. The slates are also intruded by small dikes of amphibolitic and chloritic schists, probably derived from dioritic rocks.

This altered diorite, or "greenstone," carries innumerable quartz stringers and veins. Free gold and sulphurets are found, not only in the quartz, but also throughout the greenstone. The foot and hanging walls are also slightly mineralized. The veins vary from mere stringers to broad zones 16 feet or more in width. In addition to these mineralized schists or greenstones, which are being profitably worked in a number of cases, notably the Bonnie Bee mine in Bear valley, Placer county, there are quartz veins in fissures in the slates, carrying free gold and sulphurets. The ore is usually found in elongated "kidneys," or ore shoots of steep dip, several such shoots occurring in a single vein.

As previously stated the relief of the country is strongly marked. The streams are torrential and have cut their way in abrupt rocky canyons, 1500 to 2500 feet deep. These streams, the various branches and tributaries of the American and Yuba rivers, are separated by narrow ridges. The caps of these ridges consist chiefly of fragmental andesite, and massive and fragmental rhyolite, which have preserved the underlying slates from denudation. The veins cannot be traced continuously because of this lava cap, yet the occurrence of similar ore bodies on either side of successive canyons suggests the continuity of the veins.

The mines located on these belts will be briefly described, the main object being to show the methods employed due to the great relief in the topography.

tages is well illustrated in the installations of a number of mines.

Starting at the southern end of the belt is the Pioneer, on the south bank of the North Fork of the American river. This mine is not worked at present, but consists of well defined normal quartz veins carrying free gold with a small proportion of sulphurets. The mine has been opened by three cross-cut tunnels. The lower one is 1400 feet long, the vein having been followed 2500 feet along this level. The Dorer crops on the canyon side north of Humburg Bar. The vein has a clay slate hanging and a quartzitic sandstone footwall.

The Southern Cross mine is on the North Fork of the American river in Placer county. The main tunnel is in 800 feet on the vein and is connected by a raise with the upper tunnel, which is in 600 feet. The mine is equipped with a 10-stamp mill, containing the latest improvements and one of the best built in the county. Mortar blocks are in place and everything is ready for the installation of an additional ten stamps. The foundations are especially noteworthy, excavation having been made in the schist bedrock, and concrete walls and bases put in. Wooden mortar blocks are used, each 18 feet long, and 5x2½ feet cross section, two for each battery. While but 6 miles by trail from the Southern Pacific station of Towle, yet the country is such that it was found cheaper to haul all material 35 miles from Colfax over a wagon road, and then drag it down a 2½-mile slide to the mine. Eight horses were required to drag each of the 2½-ton mortar blocks.

The river is dammed 2600 feet above the mouth of the tunnel by a timber and stone dam 35 feet high. Its location and construction is shown in the accompanying engraving. This furnishes an ample water

supply throughout the year for a 350 H. P. Rodney-Hunt turbine wheel belted to a 350 H. P. Westinghouse alternating current generator, 2000 volts, three-phase, 7200 alternations. This furnishes power to run a 15 H. P. induction motor belted to a 10x14 Blake crusher, a 50 H. P. induction motor running the stamps and concentrators, and a 50 H. P. Rix air compressor. It also furnishes power for lighting and is intended to furnish power for heating, as electric heaters are to be put in. The mill was installed by the Risdon Iron Works, of San Francisco, Cal., and has four 6-foot Johnson concentrators. It is intended to put in additional compressor capacity. This property has been running nearly continuously since Nov. 19, 1903. It is owned by the International Mining & Securities Co. R. J. Trimble is president and acting superintendent, Towle P. O.

The Soldan, or Rawhide mine, lies over the next ridge on the North Fork of the North Fork of the American river. The tunnel mouth is located several hundred feet above the river bed, and the ore is conveyed to the 10-stamp mill by a Hallidie tramway 2400 feet long with 900 feet difference in elevation between terminals. The lower tunnel has been driven 610 feet. A 95-foot head of water is available the year round. At present the dam is being built higher, being 20 feet high, 10 feet through at the top and 50 feet across. A 15-inch Rix air compressor run by a Pelton wheel has just been installed; 3000 feet of 3-inch pipe carries ore to the mine. H. W. Morris is superintendent at the mine.

Blue canyon gives the next exposure of the slates. A number of mines and prospects throughout its length attest the continuity of mineral bearing veins, but these were not visited or examined by the writer.

The slate belt is next exposed by the canyon of Bear river. Numerous quartz ledges occur below Bear valley, but the Bonnie Bee and Ziebright mines on either side of the river are the only ones being worked at present. At the Bonnie Bee mine water under 422 feet head is used as power. A 5-stamp prospecting mill with a 6-foot Frue vanner and a Blake crusher handles all the ore. A 5-foot Pelton wheel runs the 14x20 double cylinder, compound, Giant air compressor.

J. L. Waggoner, the superintendent, has displayed great ingenuity and originality in meeting certain problems connected with this property. The main tunnel had originally been driven near the bottom of the canyon without regard to obtaining a sufficient fall for a subsequent mill. In order to get the necessary height and drop, the rock breaker and ore bin

had to be placed 60 feet above the tunnel mouth. In order to raise the ore to the breaker, a three-rail track with a turnout in the middle was built from the tunnel to the top of the mill. Two platform tanks, mounted on trucks, are run on the tracks. A loaded car is run onto the lower platform, and the upper one filled with water. When full the weight is greater than that of the lower one, consequently the upper one descends and pulls the loaded car to the top, the two being attached by a cable controlled by a brake. The water is run on out the lower one, and the operation repeated. The arrangement can best be understood from the accompanying picture. As water is very cheap, this forms a simple, rapid and convenient hoist.

Considerable difficulty has been experienced in the past in saving all the free gold in the ore. Superintendent Waggoner spent the entire winter in experimenting and finally succeeded in rearranging the mortar and stamps so as to obtain almost perfect battery amalgamation. The gold occurs in silica grains, and formerly would not amalgamate. By removing the 1½-inch cast liners from the mortar, and replacing them by ½-inch boiler plate, he enlarged the interior of the mortars. The 1000-pound stamps were given an 8-inch drop at about eighty per minute, with a 7-inch discharge. The scouring action is avoided by a trough placed at the lower end of the back plate and by a front riddle formed by the inside liner placed ¼ inch above the lower chuck block plate. The interesting feature of this arrangement is that it works. Most of the gold is caught inside the mortar, the plates catching but little. Formerly much of the gold was lost.

Water under pressure is carried all through the mine for drilling. The company expects to install an

additional fifteen stamps at their earliest convenience, and a new water wheel is to be added to run the rock breaker separately, and four new machine drills are to be put in. Use of the present 700-foot main drift is to be discontinued and a new one driven 60 feet above so that the ore can be handled by gravity. J. L. Waggoner, Dutch Flat, Cal., is superintendent.

The Ziebright mine is similar in most respects to the Bonnie Bee. A new 10-stamp mill has been completed and is running. It is equipped with W. H. Martin's new wedge-stem guide, which does away with many bolts in the frame. The tramway from the mouth of the tunnel to the mill is covered to keep off the snow. The drift is in 260 feet. Henry Fuller is superintendent at the mine.

On the South Fork of the Yuba the Washington and Cooley mines form a probable continuation of the belt. Farther north the National and Culbertson, with the mines at Minnesota and Alleghany, mark the probable limit of the belt.

Much remains to be done in tracing the continuity of this great belt. But enough has been done to show that there is a section of country offering great opportunity to the prospector and capitalist. While it is not claimed that this is a part of the Mother Lode of California, yet there is undoubtedly a great mineralized zone running nearly parallel with the range. One prominent Nevada county miner has named this the "Father Lode of California." So far but little attention has been paid to the sulphurets, most of the miners being satisfied with the returns from the free gold. Experiments with regard to the adaptability of the cyanide process are being carried on, but the commercial solution to the question lies in the establishment of a ready and cheap means of transportation. Mountain trails do not offer ideal inducements for moving material and it is perhaps to this cause that the slow progress of the past may be due.

### Volatilization of Metals.

The successful melting of quartz makes possible the manufacture of receptacles which offer unusual resistance to ordinary sources of heat.

In recent experiments noted by H. Bois in La Nature, there was employed a Heraeus furnace, elec-

### Electrical Precipitation in Montana.

Written for the MINING AND SCIENTIFIC PRESS by  
MATT. W. ALDERSON.

In the early history of cyaniding the greatest difficulty met was in securing a successful precipitation of the gold after it had been taken into solution. Gradually this difficulty was overcome until at the present time perfect precipitation can be made from most solutions by the aid of zinc shavings or zinc dust. Difficulty is, nevertheless, occasionally experienced; and it was to overcome such that electrical precipitation was attempted at the plant of the Gold Cord M. Co. at the Empire mines near Marysville, Mont.

The Charles Butters Co. plant near Virginia City, Nev., is also equipped for electrical precipitation.

pump. This pump is at the lower end of the dam and the tailings are sluiced to it as shown in the accompanying illustration. The pump elevates the tailings to a launder through which they flow to a battery of eight classifiers. Forty inches fall was required in the launder to convey the tailings 125 feet from the end of the standpipe of the pump to the classifiers. The classifiers are shown in accompanying illustration. The material as it reaches the classifiers is about one part tailings to twelve of water. When the sand reaches the leaching vat it is about one part sand to three of water, showing a removal of nine parts of water and slimes in the classifiers. The slimes are not being treated at present, but are run back into an upper dam and held for future possible treatment. The sands treated contain about 12% of slimes.

There are five leaching vats 40 feet by 10 feet in

Sluicing Tailings to Vats at Empire Cyanide Plant, Marysville, Mont.

trically heated, and formed of the tube of porcelain surrounded by a sheet of platinum. The quartz receptacles were in the form of an L, the metal usually being placed in a bulb down at the top of this L and bent. The temperatures obtained were determined by means of thermo pairs of platinum and platinum-rhodium, and a vacuum was created which corresponded to that of a cathodic ray tube.

Zinc began to distill in a very clear manner at 430° C. without melting, the distillation continuing afterwards at a temperature of 300°. The zinc was distilled and condensed six times, three grams of the total evaporating in twenty minutes. Cadmium began to evaporate at 300° C. and distilled visibly at 448°; selenium volatilized easily at 380°; tellurium boiled and distilled quickly at 540° C. Lead was more difficult to distill. At 800° C., however, the metal volatilized sufficiently to form a sheet which could be melted, and at 1160° C. it boiled regularly and distilled easily. Antimony was volatilized at 670° C. and distilled at 780°, while for bismuth the corresponding temperatures were 540° and 1140°, fifteen minutes being necessary for three grams. Tin was volatilized at 1100°; silver began to volatilize at 1200° and at 1340° it distilled at the rate of .09 gram in twelve minutes. Copper was more refractory, beginning to distill only at 1315°; gold resisted still more, being liquefied at 1180°, at 1300° commencing to distill, while at 1375° there was distilled sufficient to form a sheet.

The Montana plant embodies several original features which, with the innovations introduced by J. L. Malm, manager of the company, in the loading of the sands in the vats, make its successful operation of more than ordinary interest.

The first year the vats were loaded by cars which had been previously filled by teams and scrapers in the usual way. Great difficulty was experienced in keeping the track in line, as it would sag in spots where it crossed the tailings dam, and belt conveyors were substituted the ensuing year. With reasonably dry sand these worked perfectly. But a wet spell invariably caused serious trouble. Slimes would "ball up," and at every transfer unite with other masses till they entered the vats as large balls. The extraction from these was naturally very imperfect. Then, again, the tailings had been impounded in a gulch where there was a number of springs, so that it was found impossible to drain the dam, as water would "well up" and run in from the sides.

It was finally decided by Mr. Malm to try loading the vats by the aid of water, and the vats are now loaded by sluicing the tailings to them. The result has been eminently satisfactory. The expense of loading the vats is about one-third the cost of other methods, the vats are loaded in much less time, and a better leaching product is obtained. There was not sufficient fall between the dam and the vats to allow of the work being performed by gravity alone, so the tailings are elevated en route by a centrifugal

size, with four discharge holes in the bottom. From 525 to 540 tons are treated in each vat and three men load one of the vats in eighteen hours. One ton of freshly slacked lime is used to each vat of sand. With the exception of the work of the pump all the work is one of gravity, the sands being spread in the vats by a Butter's distributor. It has been claimed that loading tailings wet would not work, that a film of water surrounding the particles would prevent access of the cyanide solution and preclude the securing of a good extraction. But Mr. Malm's experience shows that this is not so. The sands are evenly distributed and uniform all through, and all portions of the charge leach perfectly.

When a vat is loaded it is allowed to drain five hours. Then the strong solution, containing 3.8 pounds cyanide to the ton of water, is started, the bottom cock being left open. It percolates downward at about 2 feet an hour. About 110 tons of this strong solution are used on each vat. As the leaching solution nears the bottom, air and water bubble out together and the escape cock at the bottom of the vat is closed. The vat is then allowed to stand two hours, or until the solution on top remains stationary, absorption having ceased. The bottom cock is then opened and the escaping fluid is run to wash storage, until it shows cyanide or values, after which it goes to the gold solution vat. The strong solution is followed by washes aggregating about 500 tons to the vat. Four days from the time the sands are

sluiced into each vat are required until they are sluiced out again.

Until this year the gold solutions were assayed by the well-known lead tray evaporating system, a method which has proven more satisfactory than many that have been suggested to take its place. This year, however, all the solution assays are made by a scheme originated by A. Chiddey of Amapala, Honduras, and given to the world about eighteen months ago. It is simple, expeditious, and enables one to assay a large sample speedily, results often being obtained inside of twenty minutes from the time sample is brought into the assay office. The Chiddey scheme is as follows:

Introduce into a breaker, or porcelain dish, four assay tons of solution, add 10 c.c. of a 10% solution of acetate of lead, then 4 grams of zinc shavings; boil a minute, add 20 c.c. of hydrochloric acid. When the action has ceased, boil again. Wash the spongy lead with distilled water; transfer it with a stirring rod to a piece of filter paper; squeeze into a compact lump and place in a hot cupel. It is well sometimes to have a piece of dry pine in the mouth of the muffle so it is filled with flame at the moment of introducing the spongy lead. When the solution does not carry sufficient silver to part, add a known quantity of nitrate of silver before adding the acetate of lead.

The tailings treated at the Empire mines are the lowest in value of any that have been successfully handled in Montana. While the entire lot will average about \$4 per ton, the higher grade are on the bottom; and those being treated at present average about \$2.20. From these the extraction runs from 80% to 84%. It is the intention in the leaching operations to have for precipitation a tonnage of solution equal to tonnage of sands leached. This gives about 500 tons a day; and, when material assays \$2.20, the solution entering the precipitation box averages about \$1.90 and carries 0.8 to one pound of cyanide. When it leaves the extractor—to be used over again—it has from 1 pound to 1.3 pound of cyanide, a regeneration of nearly three-tenths of a pound of cyanide to the ton by the removal of base products. The effluent solution assays from 8 to 10 cents in the precious metals. The solutions are heated by exhaust steam to a temperature of 100° F. before being run into the precipitation boxes, so the leaching solutions are also warm, running about 60°.

(TO BE CONTINUED.)

## The Desert Dry Lakes of California.

Written for the MINING AND SCIENTIFIC PRESS by  
G. E. BAILEY, E. M.

**INTRODUCTORY.**—The following notes on the dry saline lakes of the desert portion of California have been gathered together in the present form in order to call attention to the value of these deposits of salines, and to the importance of protecting and preserving them.

Quotations from all sources of authority are freely made, showing that all who have given any attention to the subject agree that from their very origin all the dry lakes contain valuable deposits of salines, and that they form one of the most important resources of that State. It is a fact, well known to scientists, that the borax, carbonates of soda, sulphate of soda, niter, and similar salines of California, are only found in the desert portions of the State; and that they are, in fact, only in that certain portion which is known to geologists as the "Great Basin." All of the lakes of the Great Basin—whether containing water or whether dried up—are saline in character, and only the lakes of the southwestern portion of the Great Basin, viz., those in California, and those in the southwestern portion of Nevada, close to the California line, carry valuable contents of borax, carbonate of soda and niter, the lakes of the rest of the Great Basin being valuable only for salt.

**DESCRIPTIVE.**—In 1883 H. G. Hanks, State Mineralogist of California, published as "Part 2 of the Third Annual Report of the State Mineralogist," a "Report on the Borax Deposits of California and Nevada," which was accompanied by a map showing the locality of the principal borax fields. This report and the accompanying map show that all borax fields (with one exception) are located in the desert portion of southeastern California and in western Nevada. The one minor exception is the borax in the waters of the small Borax lake in Lake county—a small source of supply soon exhausted. The other points marked on this map west of the desert portion mark only springs, whose waters contain borax. It will be noted from this map that the Nevada fields are really the northern extension of the California fields, the drainage of the Great Basin being towards its greatest depression in the south known as Death Valley. A careful and exhaustive examination of geological surveys, maps, statistics of production, and scientific magazines and papers, fail to show that any borax or niter is known to exist in the United States outside of the Great Basin. The report on the "Saline Deposits of California," which is known as Bulletin No. 24 of the California State Mining Bureau, contains the following statement:

With the exception of salt made from ocean water, the great bulk of the salines of California, the borax, niter,

soda and salt, is found within the boundaries of what is known to the geologist as the Great Basin.

This fact is also shown by the first map in this bulletin where the saline lakes of southern California are printed in blue color on the map, and it is also shown on the last map of the same bulletin where the character as well as the location of the salines of the entire State are printed in red.

**THE GREAT BASIN.**—By the Great Basin is meant the great desert region that lies between the Wasatch range of mountains in Utah, and the Sierra Nevada range in California, extending in the north from Oregon and Idaho to Arizona and Lower California in the south. The Great Basin is divided by geologists into four minor areas, known as Lake Bonneville, Lake Lahontan, Lake Aubury and Lake Le Conte, or lakes that were themselves but remnants of the vast inland sea that once covered the whole of the Great Basin. Bulletin No. 24 speaks of them as follows:

The history of two of these lakes has been published in the volumes of the U. S. Geological Survey. Lake Bonneville filled the depression along the eastern border of the Great Basin, and its lowest depression is now known as the Great Salt Lake of Utah. Lake Lahontan filled a similar depression along the western border of the Great Basin, and the remains of its position are marked by the lakes now known as Winnemucca, Humboldt, Carson, Walker, etc. A third lake filled the southwestern portion of the Great Basin, and its lowest pools are now known as Death Valley, Owens lake, and the host of dry lakes and sinks of the Mohave desert. The fourth lake filled the area now known as the Colorado desert, and its lowest pool is marked by the Salton sea.

In the same bulletin the name of Lake Aubury is given to the third lake and Lake Le Conte to the fourth lake, which is represented now by Salton sea. In 1890 there was published by the U. S. Geological Survey, as "Monograph No. 1," an exhaustive and elaborate report on Lake Bonneville by G. K. Gilbert, from which the following extracts are quoted:

The major part of the North American continent is drained by streams flowing to the ocean, but there are a few restricted areas having no outward drainage. The largest of these is called by Fremont, who first achieved an adequate conception of its character and extent, the Great Basin, and is still universally known by that name. It is not, as the title might suggest, a single cup-shaped depression gathering its waters at a common center, but a broad area of varied surface, naturally divided into a large number of independent drainage districts. It lies near the western margin of the continent. On the north it is bounded by the drainage basin of the Columbia, on the east by that of the Colorado of the west, and on the west by the basins of the San Joaquin, the Sacramento, and numerous minor streams. The central portion of the western water parting is the crest of the Sierra Nevada, one of the greatest mountain masses of the United States, and farther south high mountains constitute much of the boundary. The extreme length in a direction somewhat west of north and east of south is about 880 miles, the extreme breadth from east to west is 572 miles.

Again on page 6 of the same monograph Dr. Gilbert says:

Between the ranges are smooth valleys. In general they are trough like. In the local terminology they are called deserts. The largest are the Great Salt Lake and Carson deserts at the north and the Mojave and the Colorado deserts at the south. Southward there is a gradual and irregular descent to about sea level, and limited areas in Death Valley and Coahuila valley lie lower than the surface of the ocean. Coahuila valley is the old name of Salton sea.

On page 8, Lake Bonneville, Dr. Gilbert says:

In the southern half of the basin there are no lakes dependent for their water on the interior ranges. At the east the most southerly lake is Sevier; the last of the lakes sustained by the Sierra is Owens. Then for 300 miles evaporation is supreme. Playas abound, streams are almost unknown and springs are rare. Death Valley, with its floor of salt spread lower than the surface of the ocean, is overlooked on either side by mountains from 5000 to 10,000 feet high, but they yield it no flowing stream, and more than one traveler has perished from thirst while endeavoring to pass from spring to spring. The Mojave river is 100 miles long, but it preserves its life only by concealment, creeping through the gravel of the desert and betraying its existence only where ledges of rock athwart its course force it to the surface.

In 1885 this work on the Great Basin was continued by the publication of the "Geological History of Lake Lahontan" by I. C. Russell as Monograph No. 11 of the U. S. Geological Survey. The following extracts are from Mr. Russell's general description of the Great Basin:

In crossing from the Atlantic to the Pacific, between the Mexican boundary and the central portion of Oregon, one finds a region, bounded by the Sierra Nevada on the west and the Rocky mountain system on the east, that stands in marked contrast in nearly all of its scenic features with the remaining portions of the United States. He must compare it rather to the parched and desert areas of Arabia and the shores of the Dead sea and the Caspian. To the geographer the most striking characteristics of the country stretching eastward from the base of the Sierra Nevada, is that it is a region of interior drainage. For this reason it is known as the Great Basin. No streams that rise within it carry their contributions to the ocean, but all the snow and rain that falls inside the rim of the basin is returned to the atmosphere, either by direct evaporation from the soil or after

finding its way into some of the lakes that occupy the depressions of the irregular surface. The area thus isolated from the oceanic water systems is 800 miles in length from north to south and nearly 500 miles broad in the widest part. The southern portion of the region includes the Colorado desert, Death valley, and much of the arid country in southern California and Nevada. At the south, the valleys of the Great Basin are low lying, Death Valley and the Colorado desert being depressed below the level of the sea. The valleys or plains separating the mountain ranges, far from being fruitful, shady vales, with life-giving streams, are often absolute deserts, totally destitute of water and treeless for many days' journey, the gray green sagebrush alone giving character to the landscape. Many of them have playing in their lowest depressions—simply mud plains left by the evaporation of former lakes—that are sometimes of vast extent. Other portions of the valley become incrustated to the depth of several inches with alkaline salts, which rise to the surface as an efflorescence and give the appearance of drifting snow. The lakes, into which much of the surface drainage finds its way, are commonly saline and alkaline—their shores, desert wastes, shunned by animals and all but salt-loving plants. It may be taken, as a rule, that all lakes that overflow are fresh; and all lakes which do not find an outlet become in time charged with mineral salts. River water is never absolutely pure, but contains a small percentage of mineral matter, which is left behind when the water is evaporated. Should this process continue long enough, it is evident that a lake without an outlet would in time become a saturated solution, from which the less soluble mineral salts would begin to crystallize.

In speaking of the Mojave desert, Bulletin No. 24 says:

What is now generally known as the Mojave desert was covered by an immense lake that, later on, shrunk by evaporation to an intricate series of chained lakes.

**ALL THE DRY LAKES ARE SALINE.**—This is a fact, no matter whether they contain water or whether they have evaporated to complete dryness. In the quotation made from Dr. Gilbert's monograph on Lake Bonneville, he speaks of "Death Valley with its floor of salt spread lower than the surface of the ocean." In the quotation from the monograph on Lake Lahontan by I. C. Russell, this saline character of the lakes of the Great Basin is noted with a clearness and emphasis that can leave no doubt in the mind of any one.

In applying his definition to localities in California it can be stated, without fear of contradiction, that all of the so called "dry lakes" of the following counties are saline in character, viz: All those in Kern county, south of the Tehachapi and east of the Sierra Nevada range; all of those in Los Angeles county north of the Sierra Madre mountains; all of those in San Diego county east of the main range; all of those in Riverside county east of the San Bernardino and San Jacinto ranges; all of those in San Bernardino county north of, or east of, the San Bernardino range; all of those in Inyo and Mono counties east of the Sierra Nevada divide; and the dry lakes in Lassen and Modoc counties east of the Sierras. This fact is important to remember in connection with the conserving of the salines of the State. All dry lakes of the desert should be reserved as saline whether such salines are in sight on the surface, or covered by strata of sand or clay.

(TO BE CONTINUED.)

## Chlorination at Hodson, California.

Written for the MINING AND SCIENTIFIC PRESS.

A description of the new chlorination plant erected on the Royal Consolidated mine, Hodson, Calaveras county, Cal., is of unusual interest to mining men in California, inasmuch as it is an innovation in chlorinating methods as practiced on the Pacific coast, and may revolutionize the chlorination process in this country. It is important, first, in great saving in labor costs; second, economy of fuel; third, uniformity of roast. The ore receiving the salt at the right time under the proper conditions minimizes the risk of loss of gold by volatilization. The ore leaves the furnace perfectly roasted and in a porous condition, rendering it easy of leaching, free from clinker or lumps of any kind, which tends to the highest extraction of the gold contents. The Merton roasting furnace constructed at this plant is the first erected in America, although largely used in Australia and elsewhere, is 32 feet long by 8 feet 6 inches wide over all, with three floors, one above the other, delivering onto a short finishing hearth. The hearths on the three floors are each 20 feet long by 7 feet wide, and the small finishing hearth 7 feet in diameter, making a total hearth area of 67 feet by 7. The ore is fed into the top of the upper chamber behind the flue; this prevents dusting and is carried by means of rables attached to four vertical shafts which rotate at the speed of 1½ revolutions per minute. The field of each rable intersects the field of the other. In this manner the ore passes from one end of each hearth to the other end, where a slide can be opened more or less, thus regulating the amount of ore to be discharged to the next hearth below; where, as above, it is carried by the rotating rables to the other end, and is discharged to the next hearth below, and so on. The ore may remain on each hearth a greater or less time according to the character of ore being roasted,

and in greater or less degrees of heat at the will of the furnace man. The regulation of heat is perfectly controlled by doors opening direct to the atmosphere, both at the sides and the ends of furnace. At the end of the lower, or third hearth, a connection is made with a flue leading to a chimney stack. This is used to regulate the heat, where the ore being roasted is heavy in sulphur, and is put in use by opening a damper leading to the stack, and putting in a fire-tile damper between the third and second hearths, which causes all the waste gases of fuel combustion, etc., to be carried direct to the chimney and muffs off the two upper decks, which is of importance, as it enables the undiluted sulphurous acid fumes to be conveyed to chambers for the manufacture of sulphuric acid, without in any way interfering with the effective roast of the ore, where circumstances warrant the saving of the acid.

When the ore reaches the finishing hearth, the salt is added—about thirty pounds to the ton of sulphurets—and in about twenty minutes the ore is ready to discharge. By drawing a slide the ore discharges into a double push conveyor, which not only elevates and delivers the ore into the hopper over the barrel, but cools it in transit. The ore is fed from hopper by a chute direct into the barrel, which holds four tons of roasted ore, and is filled in ten minutes. The amount of water used in the barrel is 40% of the weight of ore, to which is added 250 pounds of sulphuric acid and eighty-five pounds of chloride of lime. The barrel is run three hours and then allowed to rest one-half hour; this enables the ore to settle on the filter, forming a natural filter in itself. The barrel is now filled with water and the gold solution is run off into a tank 10x7 feet and containing a filter. The filtered solution is then run into a tank of the same size as the one above. This tank is thoroughly coated with paraffine wax, and is used as a precipitating tank.

The precipitant used is SO<sub>2</sub> produced by the action of H<sub>2</sub>SO<sub>4</sub> on carbon in the form of charcoal in an iron retort. The gas passes through a water cooler by means of a spiral lead pipe placed in a vessel containing a flow of cool water. Four and one-half pounds of acid will precipitate the gold from one barrel of ore. As soon as the solution indicates the conversion of all gold into metallic state, the gas is discontinued and the solution is run direct into a sawdust filter, the solution in the tank being agitated to prevent the gold being precipitated in the tank during, or at intervals, the flowing into the sawdust filter. This is an important improvement on the sulphate-of-iron method used generally in the Plattner process, as the clean-up is going on every day, and only two precipitation tanks are used, there being only four tanks in works having a capacity of ten tons of sulphurets per day. The sawdust makes a perfect filter and where the gold is required, it will be found to be in the first 6 inches in depth of sawdust in the top sawdust filter. This is taken out and the filter refilled with sawdust ready for immediate use.

The sawdust containing the gold is placed in cast iron dishes about 2 feet long by 8 inches wide and 4 inches deep and set in a small reverberatory furnace, capable of holding six or eight of these, and in three to four hours the sawdust is incinerated to ash which contains the gold, no stirring whatever being necessary. This ash is mixed with a little over an equal weight of borax and melted in a clay lined plumbago pot, the resulting gold being nearly 1000 fine. After the solution passes through the sawdust filters, it is conveyed into a sand filter. This sand is assayed at intervals to discover if any metallic gold is being carried through the sawdust. The solution then passes over scrap copper which precipitates any silver present and it then passes through a tank of scrap iron which precipitates any copper, etc., and then flows to waste.

The compactness of the plant and its automatic operation enable the work to be done by two men in day shift and one at night, a total of three men for twenty-four hours.

Oil fuel is used and is proven to be an ideal fuel for this type of roasting furnace; the oil consumption is fifteen barrels for four days operations, which on this ore equals fifteen and three-fourths gallons of oil per ton of sulphurets treated. The cost of oil delivered on the works is \$1.25 per barrel, which equals 47 cents per ton of sulphurets roasted.

	Pound.
Sulphuric acid costs at works.....	2 1/2c
Chloride of lime .....	2 1/2c

The treatment cost per ton of roasted ore is made up as follows:

	Per Ton.
In four tons roasted ore, acid .....	\$6.25 = .81
In four tons roasted ore, lime .....	2.10 = .53
In four tons roasted ore, salt .....	.26
Three men treating ten tons in twenty-four hours....	8.25 .83
Oil.....	.47
	3.65
Power.....	.16
	3.84

To this has to be added renewals, depreciation, etc. In Australia, where the Merton furnaces have roasted hundreds of thousands of tons of many classes of ores, the wear and tear, it is stated, does not amount to more than 2 cents per ton of ore roasted, consequently it may be anticipated that this expense will not be exceeded in the United States.

### The Traylor Centripect Screen.

The manufacturers of the Traylor centripect screen, illustrated herewith, claim to have a machine that will perfectly size crushed material, either wet or dry, from the coarsest product up to 100 mesh in fineness, that will absolutely screen without clogging and will operate indefinitely without attendance.

If true, this device represents a radical improve-

Side Sectional Elevation Traylor Centripect Screen.

Plan—Traylor Centripect Screen.

Triple Unit Wet Screen.

ment in ore milling apparatus. Perfect classification means better saving in the mill, and mining engineers who watched the endurance and capacity tests originally made on these screens are enthusiastic supporters of the broad claims made by the manufacturers, one engineer having expressed it as his opinion that "the centripect screen would in a short

time be as widely and generally used as the Wilfley table."

In addition to the broad claims above mentioned, the manufacturers claim the following as specific advantages of the Traylor centripect screen: "Perfect distribution of pulp by means of centrifugal motion and upward impact; upward impact prevents screen cloth from clogging; screen meshes always open; every inch of screen surface working wherever the power is on; has ten times the capacity per square foot of screen cloth of any revolving screen; only ten square feet of screen cloth to be renewed in place of 80 to 100 square feet, as on the revolving screen; screen cloth wears longer; no pounding or brushing to keep screen open; pulp does not drag, but proceeds by leaps or bounds, thus giving all undersize particles a chance to pass through screen and minimizing screen wear; cleaner screening means less slimes, less undersize returned to regrinding machines and increased crushing capacity; in wet screening, no spray or additional hydraulic water is required, the water coming with any pulp being amply sufficient; no 'balling up' of wet pulp is possible on the centripect screen; it sizes more closely than can be done by hand screening; its classification of pulp by size of particles is admirably superior to hydraulic classification."

The Traylor centripect screen depends for its efficiency on centrifugal motion used in conjunction with an upward impact—hence the name. The centripect screen is a slow speed screen and is enabled to distribute the material with only a moderate centrifugal force that would have no effect alone were it not for the upward impacts, 600 per minute, which keep the pulp constantly leaping slightly from the surface of the screen.

The device consists essentially of a dished screen, approximately saucer shaped, mounted on a vertical shaft which rotates at a speed of about thirty revolutions per minute. This slow speed provides ample centrifugal force to properly distribute the pulp, only when used in connection with the upward impact. The crushed material is delivered to a feed plate at the center of the screen and would remain there inert if the screen were simply revolved, as the above speed does not provide sufficient centrifugal force to entirely overcome gravity. However, the manufacturers say: "The moment that the upward impact is used the ore particles are raised slightly from the surface, and by the time the screen has reached its ordinary speed, thirty revolutions per minute, the pulp is fairly alive and the centrifugal force is distributing it evenly toward the periphery where the oversize is taken off, the undersize passing through the screen being delivered to the center of the next finer screen where double or triple unit screens are used."

The mechanism for producing both the impact and the rotary motion has been designed to secure the fewest number of moving parts, and to be so arranged that it is impossible for them to slip or become deranged when in action. The impact motion is obtained by revolving one multiple-faced manganese steel cam against another, thus designed to produce the effect of a succession of cams, and by this means to reduce undue wear incident to a single high-speed cam to a minimum. The tension required for the impact is obtained from a heavy crucible steel helical spring of the railway car type. The operating shaft passes downward through a beveled gear, the shaft being spliced therein so as to produce positive rotation and at the same time permit the free vertical motion required for the impact. The head motion is enclosed in a dust-proof case containing oil, all working parts thus operating in oil insuring excellent wearing qualities and a minimum of attention.

The centripect screens are built in single, double and triple units, i.e. with one, two or three screens operated from one head motion, the accompanying illustration showing a triple-unit screen arranged for wet work. In the case of double or triple-unit screens the shaft of the second screen screws into the hub of the first and so on. An adjustable spring step bearing is provided at the bottom to act as a guide, also to supply additional tension as required.

For wet screening, as shown in the accompanying cuts, a pan of sheet steel of same form as the screen surface is riveted to the screen arms and to the center, but thus forming a water-tight irrigating dish immediately under the screen. The water coming with the pulp is not lost during the first 6 inches, consequently no sprays or additional water are required with the centripect screen. The manufacturers say: "Any pulp that will flow contains sufficient water to irrigate itself perfectly on the Traylor screen."

The irrigating pan is omitted in the dry screen, the "through" product falling directly into the hopper. The housing of the dry screen differs from that of the wet screen in that the launders and hoppers are given a fall of 45°.

A number of these screens are already in use. In addition to screens supplied to Colorado and other Western States, the manufacturers report having shipped machines to Mexico and to Cuba for both wet and dry work.

The Traylor centripect screen is the invention of Samuel W. Traylor, for many years one of the constructing engineers for the Colorado Iron Works Co. and latterly manager of their Eastern office. The

screens are being manufactured by the Traylor Engineering Co., 118 Liberty street, New York, from whom further details may be obtained upon application.

### The Cooley Engine.

The claims of the Cooley General Development Co., Jamaica Plain (Boston), Mass., for the new engine manufactured by them, are that it will withstand hard usage, may be immersed in water, exposed in damp places without injury, has few wearing parts, and does not require an engineer to run. This engine is built on the rotary principle.

Fig. 1. shows the moving parts in place within the

Internal Construction.

cylinder. These consist, as will be noted, of a slotted hub on the main shaft into which fit the four cylindrical steel roller valves. When in operation the roller valves roll upon the bore of the cylinder and are held there by steam pressure and centrifugal force.

This engine is built for either belt or direct con-

Direct Connected.

nected. For direct connected work it is made in the straightaway and reversible types.

An "industrial type" for use in machine shops,

Industrial Type.

stamp mills, rock crushers, prospecting outfits, drilling sets, etc., is also shown.

The manufacturers say this engine is more remarkable for that which it does without rather than that which is in evidence, and that it will stand up and maintain good working conditions under severe shocks and strains.

In California water has been pumped by steam to supply a 40-stamp mill a distance of 14 miles, with a vertical lift of 500 feet, at a cost of 20 cents per ton of ore treated.

### The Ore Deposits of Bisbee, Arizona.\*

NUMBER VII.

Written by F. L. RANSOME.

In that very productive part of the Copper Queen workings lying northeast of the Holbrook shaft and in the corner formed by the Dividend fault and the contact of the limestones with the porphyry of Sacramento Hill minor intrusions of porphyry, probably offshoots from the main intrusive stock, have evidently influenced the deposition of the ore to an extent recognized by the miners, who expect, usually, to find ore bodies in contact with them. They appear to have the form of irregular dikes, or occa-

sionally sills. They are sometimes impregnated with a little pyrite and often decomposed to a white or yellow clay, which usually reveals its origin by the presence of grains of quartz representing former phenocrysts in the porphyry.

The relation of the ore to the porphyry is illustrated in the old Dividend stope on the fourth level,

about 650 feet northeast of the Holbrook shaft. The drifts running eastward toward the stope pass through metamorphosed limestone, impregnated with pyrite, into an irregular dike of porphyry. The ore occurs as pyrite and chalcocite, with a little chalcopyrite in soft, oxidized ground along the eastern side of this dike. It is possible that some of the ore now worked may have been deposited in porphyry, although, as a rule, this rock, when occurring as dikes and sills in the pyritized limestones, is seldom itself conspicuously mineralized.

Directly under the Hayes air shaft, on the fourth level, there is exposed a mass of porphyry, which apparently forms an irregular sill in the limestones. Immediately under the porphyry, which is undecomposed and not perceptibly mineralized, separated from it by a sharp contact, is a small, nearly horizontal mass of pyritic ore, which, as is shown by the winze, rests upon mineralized limestone.

These and other examples indicate that the presence of porphyry dikes and sills in the limestones, while by no means a necessary condition to the formation of ore bodies, is yet favorable to their occurrence.

That there is a genetic connection between the porphyry mass of Sacramento Hill and the deposition of the ores is certain. The actual relation of the ore bodies to the porphyry-limestone contact is, however, nearly as obscure as in the case of the Dividend fault. On the surface the contact is concealed by surficial material in the gulch. Even on the western slope of Sacramento Hill, where the rocks are well exposed, the alteration of porphyry and limestone is such that the actual contact between the two is rather indefinite. Underground crosscuts have not been driven far enough to throw much light upon the details of the relation between porphyry and ore. They have usually been stopped whenever anything supposed to be porphyry appeared at the face.

The general conclusion drawn from such data as are obtainable in regard to the contact between the Sacramento Hill porphyry and the limestones is given in a few words. The contact is imperfectly explored. It is apparently irregular, with conspicuous departures from a simple curved surface. It is the locus of pronounced metamorphism and mineraliza-

tion which extends both into the limestones and into the porphyry. Pyrite occurs in great abundance in the immediate vicinity of the contact—characteristically in disseminated form, but occasionally in considerable masses. The workable bodies of ore, owing their value to processes of enrichment subsequent to the primary pyritic mineralization, occur within the mass of the limestones, usually at some little distance from the actual contact to whose curved course their distribution in the main conforms.

It is highly probable, if not reasonably certain, that other fissures than the Czar and Dividend faults have helped to determine the form and position of individual ore bodies. Such fissures, however, cannot be satisfactorily studied in mines where ore value and extensive oxidation are so closely related and where workings in the soft clayey ground soon close upon disuse. In the Lowell mine there is abundant evidence that ore deposition was facilitated by irregular fissuring of general north-south trend. Most of the disturbance appears to have consisted in differential movements along planes of bedding (bedding faults) with occasional irregular fractures of no great vertical persistency cutting across the beds.

**GROUND WATER AND DEPTH OF OXIDATION.**—The general ground water level is difficult of definition in the Bisbee district. As in other arid regions, it lies deep, and oxidation has been unable to convert all of the sulphides above it into what are commonly termed oxidized ores. As country rock and ore do not constitute homogeneous material, there is thus a very irregular downward transition from the oxidized ores to the sulphide masses, involving a zone several hundred feet in depth within which ores of both classes occur.

Large masses of sulphide ore have been found on the second level of the Copper Queen mines, less than 200 feet below the surface, in the vicinity of the Dividend fault. In the Calumet & Arizona mine, on the other hand, partial oxidation has extended to a depth of over 1050 feet, as shown by the abundance of cuprite and native copper, with some limonite and malachite. In the Lowell mine oxidation has penetrated irregularly to a depth of 1100 feet. At this depth the mine, formerly nearly dry, developed a flow of water amounting to about 175,000 gallons per day.

Within the transition zone between completely oxidized and unaltered sulphide ores, which has a maximum depth or thickness of about 900 feet, the oxidizing processes are controlled to a large extent by recent irregular fissuring and by the relative permeability of the various sulphide masses to generally descending solutions. Fissures cutting through masses of lean pyrite are almost invariably accompanied by streaks of rich ore, often containing chalcocite, together with cuprite and native copper. Where there are several such fissures near one another important ore bodies result. The general association of profitable ore with fissured, broken, permeable ground is well recognized in practical operations and turned to good account in underground exploration.

Mr. Douglas, writing of the Copper Queen mine in 1899, says: "The sulphurets in these limestones occur in layers of various thickness and solidity. When solid and thin they are generally partially oxidized, and are rich. Two very large compact masses have been encountered and in part explored. The largest apexes on the 200-foot level and has been traced to the 400-foot level, and a string of stopes nearly 500 feet has been opened upon it, but the profitable ore bears only a small proportion to the whole mass. Roughly speaking, the mass is enveloped in a shell of oxysulphide, and streaks of similar black copper ore of good grade intersect it; but the core consists of compact bisulphide of iron, very lean in copper."

The essential facts of occurrence as presented in the foregoing description were confirmed by the observations made during the present investigation. The more recent workings of the Calumet & Arizona and Lowell mines afford ample opportunity for verifying the frequent occurrence of residual kernels of lean pyrite enveloped by good ore, and this in turn sometimes inclosed in oxidized ferruginous clays or "ledge matter." Such a mass of pyrite was noted on the 1000-foot level of the Lowell mine, lying generally parallel with the bedding of the limestones, and in contact with partially oxidized ore both above and below. Some native copper was seen in the oxidized ore close to the pyrite. Similar residual masses of worthless pyrite surrounded by good ore, usually containing chalcocite, were seen on the 1050-foot level of the Calumet & Arizona mine, particularly in a stope about 300 feet east of the shaft.

It thus appears that the oxidizing solutions, guided by fissures, bedding planes, and relatively porous masses of rock or ore, move generally downward, but locally also along lateral planes and upward. Permeable or fissured masses of pyrite have been more or less thoroughly altered, while compact or unfissured masses have retained to a large extent their original character, and contain but little copper.

**GENESIS OF THE ORES.**—The account of the Bisbee ore bodies given in the preceding pages shows beyond need of further demonstration that two general processes have operated to form the ores now exploited. These are (1) metasomatic alteration, including

\* Abstract Professional Paper No. 21, U. S. G. S.

pyritic mineralization, and (2) oxidation and its attendant phenomena of transportation and enrichment. Concerning the precise boundary between these two general activities some difference of opinion is possible, but as regards the essential share of each in the genesis of the ores there can be no question. There are few known ore bodies in the Bisbee quadrangle which do not demonstrably owe their value to the co-operation of both processes.

As shown in those underground workings which are below the intermediate zone penetrated by oxidizing reagents, the sulphide minerals ascribable to the earlier period of metasomatic alteration are common pyrite, and perhaps also a little chalcopyrite and sphalerite. The occurrence of some cerussite in the limestones suggests that galena may also occur, although this mineral has not been seen. Associated with these sulphides are amphibole (tremolite), pyroxene (diopside), garnet (grossularite), vesuvianite, quartz, and chlorite in the limestones; quartz, sericite, chlorite, perhaps kaolin, and a little epidote in the granite porphyry; and quartz and sericite in the Pinal schist. Tests made in the chemical laboratory of the Survey upon representative specimens of the mineralized limestone, containing abundant disseminated pyrite, but no visible chalcopyrite, afforded in one case a trace and in the other 0.12% of copper. The pyrite is, therefore, cupriferous, the copper probably occurring as an admixture of the chalcopyrite molecule.

A mass of pyrite exposed to oxidation by atmospheric agencies is probably gradually changed to ferrous sulphate, and this in turn to the ferric salt. If the sulphur in the pyrite is completely oxidized, some free sulphuric acid is also formed. Such copper as may be originally present in the pyrite, probably in the form of the chalcopyrite molecule, may be supposed to undergo a similar alteration to cuprous and cupric sulphates. These comparatively simple conditions, while they may have obtained at some early period in the geological history of most ore bodies, are not those under which the ore masses actually studied have been and are now being altered. The pyrite as a rule is not exposed at the surface, but is overlain or enveloped by the products of earlier chemical activity, which, while of an oxidizing character in the main, has probably involved reduction as a minor phenomenon. These products the oxidizing solutions must penetrate before they can directly attack the fresh pyrite. Furthermore, in an arid region, such as Bisbee, where oxidation, instead of extending uniformly down to a ground water level at a moderate distance below the surface, has penetrated very irregularly to depths of 1000 feet or more, leaving residual masses of unoxidized sulphides at higher levels, the solutions moving downward to react upon any given pyritic mass that may have been modified not only by passage through the generally oxidized zone and through secondary sulphides, but through original sulphides as well.

(TO BE CONTINUED.)

ONE of the essential features in the economical operation of mines is the construction of good roads with easy grades.

## Some Points in Wet and Dry Crushing by Rolls.

Written for the MINING AND SCIENTIFIC PRESS by R. B. LAMB.

Rock crushing devices are of many kinds, but there is perhaps no crushing machine in use which requires the attention demanded by rolls, if we are to get the capacity at reasonable cost. One of the most important factors in the operation of rolls is the speed at which they are run. On this matter much has been said and written, and mathematical data piled up respecting every portion of the machine, with instructions to direct its operation, but in actual practice we find we are required to work along lines somewhat different from those promulgated theoretically. In both dry and wet crushing the things to be watched most closely are practically the same, the great difference being that in wet crushing the water will give a much greater roll discharge, and therefore the capacity of wet-crushing rolls is correspondingly greater. The first material consideration is the roll shells. There is only one running condition permissible—the rolls must set perfectly level, they must be absolutely parallel and the side alignment must be accurate. That is, the end of one roll must not project beyond the end of the other. There must be no "rims" formed. The formation of rims in the "cheek" plates on either side at once leaves an open space at the opposite end of the roll, between the roll and the plate, and through this space much coarse material will fall, reducing the capacity of the rolls. It is self-evident that if the faces of the rolls are not true, parallel and level, loss in capacity must result. The adjustment of the rolls is of utmost importance. To keep the faces of the rolls in perfect condition nice adjustments must be maintained. These adjustments must be such that the rolls can be easily kept parallel and level, with the ends true, after having been properly adjusted. There are several ways of doing this, and it varies with each manufacturer. If the rolls are not parallel and true in alignment rims will form and cannot be avoided. It may thus be readily understood how the capacity of the rolls may be easily reduced 25% to 30%. If the rolls are not horizontal and parallel it is equally plain that one shell will be worn much more than the other. The next important factor in the operation of rolls is the speed. The best practical speed for coarse crushing—say down to  $\frac{3}{4}$ -inch mesh—is ninety revolutions per minute, and for finer crushing 100 to 160 revolutions per minute, according to the size of the rolls and material operated upon. These speeds are those which are found, in practice, to give the most satisfactory results, while keeping the roll faces smooth. Should any unevenness or bad wearing of the faces occur the roll shell should be replaced by a new one until the old one has been turned up for service again. The roll bed should be solid and without motion—securely bolted down—and there should be no "lost motion" in the journal boxes. The cheek plates must be constantly watched and be at once

replaced when they show signs of wear. For dry crushing, wooden cheek plates are inexpensive and give excellent results. For wet crushing I use an iron back to which a replaceable wood face is attached. This is quickly replaced when worn and is economical. Tension-spring bolts should be kept tight and free from foreign motion. A light spring should always be attached opposite the tension springs to take up "back motion" and to prevent unnecessary jar on the tension-spring bolts when very hard pieces of rock or other very hard substances—such as pieces of drills from the mine, or nuts from machinery, cars, etc.—pass through the rolls. To get full capacity out of rolls when they are properly adjusted, it is necessary to make an even and proper distribution of the feed across the face of the roll. This is best accomplished by means of what is known as a "splitter," being a deflecting device employed in the feed box to direct the fall of the uncrushed ore to the right or left, and being readily adjustable. A feed apron, suspended above the crushing point of the rolls, prevents the rock from flying and jumping out of the rolls.

In wet crushing, if too much water is used, the material is sluiced over the rolls, as it were, and is returned as oversize. This continuing causes this oversize to accumulate and greatly reduces the capacity of the rolls. It is no uncommon thing to find rolls which should crush 100 tons daily, passing only thirty tons, due to improper and inexperienced attention. To secure the greatest capacity rolls must be regularly and properly fed, speed maintained, and the rolls kept tight and all parts free from lost motion. The tension rods must be kept to proper tension so that the material crushed shall not be kept in circulation, instead of passing through the screens. If these essential points in running rolls were given more of the attention they deserve, rolls would find a more extended application.

## THE PROSPECTOR.

The prospector should always be contented to accept nature's conditions as he finds them, for the one who starts out to find a mine resembling some other of which he has personal knowledge or hearsay information, is likely to be disappointed. Nearly thirty years since a prospector discovered a valuable conglomerate deposit in the Black Hills of South Dakota. He made a handsome profit from it and sold to good advantage. He then spent about twenty years in the search for a similar deposit in other countries, and exhausted his capital in a fruitless quest, though he saw many promising mines of real merit, but the geological conditions did not suit him and he persistently refused to entertain any proposition but a "cement" mine rich in gold. No prospector or capitalist can afford to follow in the footsteps of this man, who for years searched vainly for a "made to order" mine.

The mineral specimens sent from Los Angeles, Cal., and obtained in San Diego county, Cal., have been identified as follows: No. 1. Chalcopyrite, altering to bornite. A light-green garnet (grossularite) is also present. No. 2. Pyrite. No. 3. Pyrite, with also crystals of mispickel (arsenical iron sulphide). A small amount of pyrrhotite in fine crystalline condition is seen in this specimen. A peculiarity of this specimen is the occurrence of scales of biotite mica in the ore. As the formation from which it comes is described as mica schist, this may not seem so strange. No. 4 is pyrite, with some chalcopyrite and bornite (black) and dark brown and black micas. No. 5 is largely pyrite and chalcopyrite (copper sulphide). Quartz is also present in this specimen. No. 6 is quartz, with pyrite and chalcopyrite. No. 7 is a variety of amphibole, probably actinolite.

The white crystallized mineral specimens from Barstow, Cal., are calcite (carbonate of calcium). Evidently this mineral has been taken for colemanite (calcium borate). Calcite effervesces readily in cold dilute acids. Colemanite is soluble in hot hydrochloric acid, but not affected by cold acids.

The mineral from Aguanga, Riverside county, Cal., is iron sulphide, variety marcasite. It should be assayed for gold and silver. This "The Prospector" does not attempt, its function being merely to identify rocks and ores as to their general character.

The minerals from Idaho Springs, Colo., are garnet and quartz. Some of the darker gneissoid specimens also contain black mica (biotite) and a little iron and copper sulphide. No tin reaction obtained.

The mineral specimen from Garden Valley, Idaho, is largely silica, and is an altered igneous rock. It contains pyrite and pyrrhotite, but no traces of platinum were found.

The mineral specimen from Manvel, Cal., is limonite (brown iron oxide). The yellow spots appear to be organic.

Power House, Royal M. & I. Co., Near Silverton, Colo.—(See Page 146.)

## Tin Deposits of the York Region, Alaska.\*

NUMBER III.—CONCLUDED.

Written by A. J. COLLIER.

While in this vicinity the writer saw a number of crystals of cassiterite which were practically transparent. Near the end of the season a large amount of supposed tin ore was collected on the flanks of Cape mountain and shipped to Seattle, where it was examined by the writer and from it samples were selected for study in the laboratory. This supposed ore contains very little tin, but several dark crystalline minerals which have been mistaken for cassiterite. The principal constituent is tourmaline, in slender black or brown needles, and wolframite or scheelite are probably present, if, as reported, a considerable amount of tungsten was found.

Extensive developments were planned for the season of 1903, and a well-equipped prospecting plant was sent to Cape mountain. A large dynamo driven by a gasoline engine was to be placed near the beach at the point now known as Tin City, and from this dynamo wires to several points on the mountain were to supply power for electric drills. By the use of these drills it was expected that tunnels could readily be extended into the heart of the mountain and cross-cut the ledges from which has come the float ore.

After spending nearly the whole of the season of 1903 in getting the machinery in place and establishing the winter camp it was found that the engine for driving the dynamo was defective, and the plan for development work during the winter of 1903-04 was necessarily suspended. This work, however, will undoubtedly be resumed in the summer of 1904, and it is to be expected that by the end of that season more definite information will have been obtained.

Stream tin is harder to separate from gravel than gold on account of its lower specific gravity, but the methods employed in washing it out were modifications of somewhat primitive processes of gold placer mining. Ten men were shoveling into the one "string" of sluice boxes and a cleanup was made four times a day, so that the work was frequently interrupted. The sluice boxes used were 16 feet long, 24 inches wide at the upper end and 22 inches wide at the lower end, and seven boxes were used in a "string," making a total length of 150 feet. A "dove box" 8 feet long, 4 feet wide at the upper end and 22 inches wide at the lower end, with riffles, was introduced between the fourth and fifth boxes from the upper end. (See Fig. 1.) Ordinary patterns of

purities in the concentrates are mainly hematite, magnetite, quartz and slate.

The discovery of tin ore in ledges has been reported

Box Used for Reconcentrating Stream Tin, Alaska.

by prospectors from many other localities in Seward peninsula, some of which deserve notice, since the geologic conditions are known to be promising.

The Diomed islands, which lie in Behring strait, midway between Alaska and Siberia, are reported to be composed of granite. It is reported that copper ore has been found on them, and should the tin ore found on Cape mountain develop commercial importance they may merit investigation.

Brooks mountain, which lies about 11 miles north of the mouth of Lost river, can easily be reached by a road up Lost river from the beach, or by following up Don river from Port Clarence. Wagons have

about 5 miles in length. About 1 mile from its mouth Buck creek receives a large tributary from the south called Sutter creek, and about 4 miles above its mouth it again forks, the two branches being known, respectively, as Right and Left forks.

Near the mouth of Buck creek boulders and pebbles of greenstone occur in the gravel deposits. These have not been traced to their source, but they probably came from a group of hills on the east side of Grouse creek before the present drainage was established. At a number of places along Buck creek small quartz veins were found cutting across the bedding or running parallel with it through the slate. Some of these quartz veins are as much as 3 or 4 feet thick.

The gravel deposits in the bed of Buck creek are from 10 to 150 feet wide, varying greatly in different parts of the creek.

Cassiterite, in the form of stream tin, is distributed from the mouth of the creek to within 1 mile of its head, above which point little more than traces have been found. The ore varies in size from sand to pebbles weighing thirteen or fourteen pounds. Several pieces from five to eight pounds in weight were seen, though the average size is much smaller. A few of the pebbles are perfectly rounded, but most of them are subangular. The ore from the claims near the mouth of Buck creek is generally well rounded, while that from near the head is sharp and angular. In general the stream tin grows more angular as the head of the creek is approached.

The color of the cassiterite varies from almost black to a light resin or amber; when crushed, however, it makes a light-colored resinous powder, by which it is readily distinguished from hematite or other iron minerals that are frequently mistaken for it, since they invariably give a distinctly red, brown or black powder. Sometimes small pieces of cassiterite are found inclosed between fragments of slate, showing that the ore sometimes occurs as veinlets in the bedrock.

It has been stated that the gravels contain about eight pounds of 60% ore to the cubic yard. The value per yard on this basis, with tin at 28 cents per pound, would be \$1.34, out of which charges for ship-

Cape Mountain, From York.

been driven over both these routes. By the latter route the mountain is 20 miles from deep water of Port Clarence. The bedrock exposed on the mountain consists of highly altered limestones and black slates which resemble the slates near York.

The sedimentary rocks are cut by a number of granite and rhyolite dikes, striking east and west. Don river, York river and Mint river carry granite boulders that have been derived from the mountain. This locality seems promising for the occurrence of tin-bearing veins, though so far as is known to the writer no tin ore has yet been identified.

On the west side of the Don river there is a ridge of high hills composed, in part, of slates like those found near York, which are cut by intrusive dikes of quartz-porphry and granite resembling the intrusives of Brooks mountain and Lost river. Some of the minerals often associated with tin ore have been found here and the region is worth investigating. This region lies about 10 miles east of Lost river and 9 miles north of Port Clarence.

At Ear mountain, 50 miles north of Teller, discoveries of tin are reported.

Buck creek was the scene of the first actual mining of tin ore in Alaska, and is the present center for tin placer mining activities. This settlement is on the Arctic slope of Seward peninsula, about 20 miles northeast from York and 4 miles from tide water on Lopp lagoon, an inlet from the Arctic ocean. It is reached by a wagon road from York. Lopp lagoon is not navigable for sea-going vessels and affords no harbor for such craft. Buck creek is a small stream

ping and treatment would have to be paid.

The pay streak appears to be confined to the present stream-bed and flood-plain deposits. In the present creek bed the ore is found from the surface to the bottom of the gravels. Outside the creek bed, in the flood plain, there is a covering of moss and muck above the pay gravel. No cassiterite is known to have been found on the hillsides surrounding Buck creek or on the plateau surface in which Buck Creek valley is incised, though such an occurrence is to be expected. The known pay streak varies in width from 10 to 150 feet, and in thickness from a few inches to 5 feet. Estimates of the amount of tin ore in the gravels vary from eight to twenty-seven pounds per cubic yard.

### Steam Engine Economically Operated.

Of interest are some results lately obtained in an official pumping engine test at the Park Avenue pumping station, Chicago. The engine is of the Worthington, duplex, reciprocating, triple-expansion type, having semi-rotary steam valves, but no fly wheel. The latter is replaced by compensating cylinders so arranged that their pistons retard the motion of the main piston during the first part of the stroke, but assist it toward the close, giving a uniform resultant thrust. The pistons of these auxiliary cylinders work against air under pressure from a tank. The engines are vertical and the weight of the pistons, plungers and rods is counterbalanced

Sluice Used in Tin Diggings, Alaska

Pole and Hungarian riffles were used, except that they were made of 2½ by 1½-inch material, which is larger and heavier than that ordinarily used in sluicing for gold. About 100 miner's inches of water constituted a sluice head for this apparatus. The concentrates from the sluice boxes were further concentrated by hand by panning in a box 5 feet long by 3 feet wide and 8 inches deep, into which water flowed through a canvas hose and flowed out over an apron 4 feet long in a stream about ¼ inch deep, as shown in Fig. 2. The concentrated gravel was gradually worked up over the edge of the pan, which was kept just submerged at the upper end of the apron, where the stream of water carried away the lighter portion, while the heavier particles sank in the box. It is reported that concentrates treated in this way averaged about 50% tin. The larger pieces of foreign matter were picked out by hand. The im-

\* Abstract Bulletin 229, U. S. Geo. Sur.

by another auxiliary balancing plunger, also working through the medium of water against air under pressure.

The capacity of the engine is about 22,000,000 gallons per day against a total head of slightly over 121 feet; 660.9 H. P. were indicated in the test. The duty obtained was 174,735,801 foot-pounds per 1000 pounds of steam used, corresponding to an economy of 11.32 pounds of steam per net horse power delivered in water lifted, or 10.01 pounds of steam per indicated horse power. The steam pressure was 144.45 pounds per square inch, with 154° Fahr. superheat at the throttle, the steam cylinders being provided with jackets and reheaters.

These tests were carried out under the supervision of the Bureau of Engineering of the City of Chicago, and, together with the engines and the power station, are fully described in a pamphlet distributed by Henry R. Worthington, 114 Liberty street, New York City.

### American Mining Congress.

The first annual session of what is now known as the American Mining Congress was held at Denver, Colo., in 1897, the second at Salt Lake City, Utah, in 1898; there was none in 1899; the third session convened at Milwaukee, Wis., in 1900; the fourth at Boise, Idaho, in 1901; the fifth at Butte, Mont., in 1902; the sixth at Deadwood, S. D., in 1903; the seventh assembled at Portland, Or., on the 22nd inst., and began with the usual speeches and preliminaries.

President Richards, in his annual address, proposed the following resolution:

Be it resolved, That the American Mining Congress, in annual session assembled, believing that the time has arrived when a Department of Mines and Mining would be the means of placing the mining industry on a plane commensurate with its independence to all industrial progress, urges the Congress of the United States to at once create a Department of Mines and Mining as one of the great executive branches of our Government.

The session of the 23rd inst. was addressed by E. B. Andrews of Nebraska on "The Promoter, His Place in Our Development;" J. H. Mitchell of Oregon on "Government Branch Mint;" M. D. Leehy of Washington on "Mining Law;" F. H. Newell and G. Pinchot of the U. S. Geological Survey on "Public Lands;" F. V. Drake of Oregon on "The Mineral Resources of Oregon;" Jno. Daggett of California on "The Mineral Resources of California;" O. W. Brown of South Dakota on "Cyanide Ores, Ragged Top District, Black Hills."

On the 24th inst. E. R. Buckley of Missouri read a paper on "The Functions of the State Geological Surveys and the Bureau of Geology and Mines." On the 25th inst. ensued discussion as to the next meeting place for the Congress. Further report of the proceedings will appear in next week's issue.

## Mining and Metallurgical Patents.

PATENTS ISSUED AUGUST 16, 1904.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

ORE CONCENTRATOR.—No. 767,926; C. A. Christensen, Oretown, Or.

Ore concentrator, consisting of diamond-shaped table having riffles formed across same, table provided with rise or upward incline along one side and up which ends of riffles extend, troughs upon rise or upward incline provided with lateral outlets facing lowest portions or bottoms of riffles, means for supplying water to troughs, receiving trough disposed beneath upwardly inclined ends of riffles, hopper at upper side of trough and opposite end from rise or upward incline, and means for imparting vibratory jarring motion to table.

OIL WELL PUMP.—No. 767,454; W. Taylor, Bonus, Pa.

In oil pump, combination of working barrel, sheath provided with standing valve at lower end, packing chamber secured to upper end, provided with tapering portion adapted to seat upon upper end of working barrel, valved piston within sheath, central valve controlled inlet opening therein, tubular shell provided with lateral openings above inlet opening, upper valve, inclosing shell, and hollow piston rod connected therewith and passing through packing chamber.

BLAST FAN.—No. 767,580; D. F. Lepley, Connellsville, Pa.

Combination in fan, of hub member having bore of greater diameter at center than at ends, disk secured to central portion of hub, end rings, spider arms connecting end rings to end portions of hub, and blades carried by disk and rings, connection between central portion of hub and disk being such as to permit distortion of such central portion without distorting shaft or affecting positions of end rings and spider arms.

EXCAVATING APPARATUS.—No. 767,765; C. W. Rood, Britt, Iowa.

In apparatus for digging ditches, combination with supporting frame, of shovel for removing earth, means for moving shovel transversely across ditch and means for directing movement of shovel to point above spoil pile.

PICK.—No. 767,951; S. Montgomery, New York, N. Y.

In pick, combination with head having arm, and

socket in one end of arm, socket having one wall cut away to form slot; of bit adapted to abut against arm, tongue integral with and extending from bit, tongue being adapted to fit snugly within socket and slot, and means for securing tongue within socket, whereby smooth continuous surfaces are produced by faces of arm and bit.

DRILL FOR DEEP WELLS.—No. 767,685; A. F. Darling, San Francisco, Cal.

In combination with drill rod and drill bit, device connecting rod and bit having removably secured thereto plurality greater than two of longitudinal skids substantially in contact with casing and arranged symmetrically around device, skids being formed of soft material to prevent wear on casing.

MAGNETIC SEPARATOR.—No. 767,105; M. Dings, Milwaukee, Wis.

In magnetic separator, combination of electro-magnet having substantially vertical axis; cup-shaped lower pole piece partially inclosing magnetic winding; upper pole piece covering magnet and projecting marginally therefrom; non-magnetic ring of less diameter than upper pole piece, but connected to latter and arranged to cover upper edge of lower pole piece.

DRILL DERRICK.—No. 767,638; L. H. Emerson and S. P. Kerstetter, De Young, Pa.

In derrick of class described, combination with mast, of sleeve secured to and surrounding upper end of mast and having relatively immovable upstanding ears, crown pulley journaled to and between ears above mast and having opposite portions projecting beyond opposite sides of mast, and guy cables attached to sleeve.

# Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE  
MINING AND SCIENTIFIC PRESS.

## ALASKA.

H. H. Hunter has the property of the Alaska-Washington G. M. Co. at Yankee Cove, near Juneau, doing development work. He has put up buildings and has driven 200 feet of tunnel in addition to the 400 feet before he took it and has also driven a raise and sunk a 50-foot shaft. The property is owned by a company, of which B. M. Behrends, of Juneau, is president. They have eight lode claims. There is water and timber close at hand with which to work the property. There have been eighteen men at work all summer.

Four tin-bearing quartz claims of J. Hollenbeck on Grouse lake, 3 miles from Lost River, near York, have been bonded to J. H. Morgan, of New York, and R. H. Rogers of London, Eng., and preparations are being made for operation of the mines.

## ARIZONA.

### Cochise County.

The Copper Queen's new smelter at Douglas has five furnaces, each having a maximum capacity of 500 tons of ore daily. It is not, however, expected by Phelps, Dodge & Co., that the Copper Queen shall supply 2500 tons of ore daily. The ores of the Phelps-Dodge mines in Mexico are shipped to Douglas and there treated. Also, a considerable tonnage of ores from the Old Dominion and United Globe mines at Globe is received, which are said to furnish a desirable flux for the Bisbee ores.

### Graham County.

The New England & Clifton M. Co. is reported to have bought the Buckeye and Sharpshooter mines, near Metcalf. The mines are showing bodies of rich ore. The same company also recently bought the Lezinsky claims on Chase creek and has men at work on them. It is said they have crosscut a body of  $3\frac{1}{2}\%$  sulphide ore for 140 feet. Development work is by tunnels, through which the ore will be taken out to the railroad on Chase creek. Development work is also being continued on the Copper King mine, one of the first claims bought by the company.

W. Poland, manager of the Arizona G. M. Co., near Clifton, reports that owing to the hot weather development work has been progressing slowly, but now that the blower has arrived work will be increased. The ore at the mouth of the tunnel averaged \$4 per ton in gold, but at the face of the tunnel it is reported averaging \$15 across 3 feet of ore.

The Z Y X M. Co. has been incorporated at Clifton with the following directors: W. Moore, W. Gunn, C. W. Beck and R. Lakanan. The camp of the company is  $\frac{3}{4}$  miles from Morenci, on Gold gulch, where men are at work. The gold-silver ore occurs in a fissure vein with a clay gouge on either side, with an average width of 15 feet between walls. The pay shoot is 5 feet in width, much of which is said to average from 1 to 3 ounces in gold and 150 ounces in silver. The silver occurs in native form, also in the form of chloride (horn silver) and bromide. Two shoots of ore have been uncovered on the lead, one for a distance of 125 feet, while the other has been prospected on the surface for a greater distance. The company owns 3000 feet of the vein, besides a spring which is 2 miles distant and 800 feet higher than the mine. It is intended to pipe the water to the mine and build a mill. In the meantime the company will continue to take out and ship ore, the income from this source being sufficient to pay operating expenses. The mine is making a sufficient amount of water for camp purposes.

The Detroit C. Co. at Morenci has started building a settling dam a few hundred feet below the concentrator, where the tailings will be restrained and the water pumped up to the mill and used again. It is at the mouth of the old Yankee tunnel and will be 50 feet high. The tailings will be allowed to settle and will then be used as a fill around the works and in the mines, while the saving thus effected in the water that now goes to waste will be a considerable item. The company has placed a motor and pump at the base of operations. The concrete work for the concentrator is growing.

### Mohave County.

The Samoan mine, near Chloride, is adding a compressor and four air drills to the mine equipment. A road has been opened to the mine and hoisting machinery brought in.

It is reported that a strike has been made in the Mocking Bird mine, near Stockton Hill, where a shaft is being sunk below the old workings. The ore is ruby

and native silver. The property is under bond to F. Stull.—Manager W. A. Mensch of the Enterprise mine has men grading a site for the hoisting plant. A road will be graded to the mine.

The pumping plant of the Gold Road M. Co., near Acme, is in operation and water is being forced over the mountain to the town. The mill is being equipped with wet crushing machinery. The plant is working smoothly and enough water for milling and town uses is obtained.—The Pasadena Con. M. Co., near Acme, in the San Francisco district, obtains water at a spring in the mountains, which is carried to the mine in a 2-inch pipe. The company is sinking a two-compartment shaft on the Rhinegold mine.

### Santa Cruz County.

C. Adams, manager of the Hermosa mines, near Harshaw, says the concentrating plant is in place and ready to start. Thirty men are working at the Hermosa mines.—At the Mowry mine, near Harshaw, seventy-five men are at work for the company. Development work is being increased, says Manager Curtis. A. Donan of Tucson is superintendent.

## CALIFORNIA.

### Amador County.

At the Treadwell mine at Volcano, Manager Schenck of the Sutter Creek G. Co., which is operating the mine, says developments are improving. The object of the 5-stamp mill is to test the ore shoots. So far results have been satisfactory and the company is securing adjoining properties. Two tunnels 500 feet in length have been run, following the veins which have proven from 3 to 10 feet in width. A shaft  $4\frac{1}{2}$  by 14 feet is being sunk on the main ledge and is 50 feet deep. Other tunnels and crosscuts will be run. There are fifteen miners employed.

Three men were killed in the Argonaut mine, near Jackson, on the 24th inst., as the result of a premature blast due to defective fuse.

### Calaveras County.

Two shifts are working steadily at the Benson mine, near Angels, the number of men having been increased on account of developments. Work on the mill is being rushed and ore is accumulating on the dump awaiting its completion. The shaft is down 100 feet and at that depth drifts have been run north and south for 35 feet. A crosscut has been started for the hanging wall in the north drift.

Superintendent Chapman has started work in opening up the tunnel on the gravel claim, near the Chris Anderson mine, near San Andreas.—One of the boiler heads blew out at the Lloyd mine last week, causing some damage and an interruption in operation of the mill. The damage is being repaired and the mill will resume this week.—The 12 H. P. engine for the hoist at the Chris Anderson mine is set up. The gravel mill is on the ground.

### Fresno County.

Coalinga reports say an oil gusher was struck last week on the ground of the Coalinga O. & G. Co. The derricks were torn down and workmen were covered with the spouting oil. The strike was made at a depth of 1630 feet. The owners expect a yield of 1000 barrels a day. The work of boring on the well began on April 26.

### Inyo County.

M. O. Hoyt, S. A. Overholtzer, O. L. Emery et al. of Colton, San Bernardino county, have incorporated the Lone Star G. M. Co., to develop a group of claims in Death valley. It is intended to put up a 2-stamp mill and a cyanide plant.

### Kern County.

Among the industries at Bakersfield, as a result of the discovery of oil in the Kern river field, says the Californian, are the oil refineries. That of the National Refining Co. of Chicago, Ill., is south of the Standard Oil Co. storage tanks. The work of construction is progressing and all of the preliminary work completed. A water well has been sunk, two 50 H. P. boilers and the necessary engines for power are in place and an electric light plant has been installed to furnish lights. The water tanks are also in place and an air compressor is used to pump water from the 450-foot well. The refinery proper will consist of five 378-barrel stills, together with the necessary coolers and condensers. Two of these stills are on the road and will be in place ready for operation next month. G. C. Calhoun is president and general manager of the company.

### Mariposa County.

At the Austin group of mines, adjoining the Triumph mine, near Whitlock, on the north and west, work is progressing in development and extraction of ore. The principal workings are on the Regan and Coronada claims. Superintendent W. H. Cavin says the ledge has an average width of 3 feet, and the ore mills \$20

per ton in free gold. A tunnel is being run to tap all the ledges in the group. The Hayseed, Regan, Coronado, Golden Gate and Dusenberry claims comprise the group. The full length of the tunnel will be 1120 feet. There are 600 feet more to run.

At the Omparisa mine, near Whitlock, H. A. Kunz, superintendent, is increasing work on the Mountain King claim. Ground is being leveled for a balance gravity tramway from the mine to the river. A crosscut tunnel is being run that will give 700 feet of backs on the ledge. Five ledges will be cut by the tunnel. A 10-stamp mill will be put in, a ditch 9900 feet in length being dug which will give a 32-foot head of water at the mill. It is proposed to build to that point a road connecting with the Mariposa and Bull Creek roads. The company will build a sawmill near Bower Cave to furnish lumber for flume and buildings.

W. B. Sayers, superintendent of the U. Roy mine at Indian Gulch, says he is putting in a hoist and other machinery to be used in development work. A stamp mill is already on the property and ore is being taken from the mine.

### Mendocino County.

A ledge of copper is reported uncovered near Eden Valley, 30 miles from Willits. R. Singleton and W. Ellis were making a road from Singleton's place out to the public road and struck the top of the ledge. Prospecting developed the ledge 20 feet in width. A pit 6 feet deep was dug and a well defined wall found on east side of ledge and in contact with this wall was found a body of malachite. It is said to be a contact vein, with serpentine on one wall and slate on the other. Arrangements are being made to do development work.

### Mono County.

Bodie reports say three roads are being built into the Masonic Mountain district—from Bodie, from Bridgeport and from Sweetwater. At the Pittsburg work will be started on winter quarters and they will work the claim through the winter. At the Myrtle & Julia group work is progressing.

### Nevada County.

F. E. Kline of the Continental C. & G. M. Co. says preparations are being made to reopen the Badger mine on Pike Flat at Grass Valley. The company will also develop copper claims near Newtown.

The Golden Star mine in Forest Springs, near Nevada City, under bond to Arbogast Bros., is being equipped with a hoisting and pumping plant. The Golden Star is near the Norambagua mine. There is a 2-foot ledge uncovered and in places free gold shows in the quartz.—The Blue Ledge M. Co. of Grass Valley, operating near Nevada City, reports work progressing. The Blue Ledge is in the Willow Valley district. They have a well developed ledge and expect to have the shaft cleaned out this week, so that sinking and drifting may be done. W. T. Jones is superintendent of the Blue Ledge.

### Placer County.

At Dutch Flat, W. & P. Nicholls are cleaning out the Somerset shaft, which was sunk about twenty years ago. The shaft is 110 feet deep and down to bedrock; a tunnel of 70 feet was run from bottom of the shaft. They have men at work on eight hour shifts and will further develop the ground.

### Plumas County.

R. E. Carswell at Taylorsville, manager of the Regal mine (formerly the Peter mine), in the north arm of Indian valley, reports his company will increase development work. It is intended to sink the shaft to 500 feet below the level of the valley and to crosscut from different levels to the vein, which is 80 feet in width. He reports a smelter necessary to extract all the values from the ore. A quartz mill was bought and will be set up and operated until other arrangements are made.

### Riverside County.

G. I. Leonard of Corona, manager, reports that it is proposed to equip with machinery the tin mines on the San Jacinto estate, 7 miles east of Corona. The mines have not been worked since 1891.

### San Bernardino County.

The Fletcher smelter at Needles is running and turning out bullion. About 1500 tons of ore were shipped from the Stockton Hill, Ariz., section and the mines are turning out 700 tons per month. During July 612 tons were shipped from Kingman, Ariz., and Berry to Needles. The company is preparing to develop the properties for increased output.

### Santa Clara County.

An agreement has been recorded by which J. V. Coleman et al. bind themselves to sell to H. C. Davy the Guadalupe quicksilver mines, near San Jose, including 1520 acres of land, machinery, etc., for

\$250,000, at any time within five years. Davy obligates himself to operate the mine continually, and to pay specified royalties on quicksilver, graduated in proportion to the product of the mine.

### Shasta County.

At French Gulch it is reported that S. Jones and M. Russell of Wallace, Idaho, negotiating for the Washington mine, will enlarge the mill.

### Siskiyou County.

C. J. Bryan has men at work putting up a quartz mill on Deadwood creek, a short distance above the junction of Cherry and McAdams creeks, near Yreka.—The Mount Vernon Co., at top of divide between Greenhorn and Cherry creeks, south of Yreka, intends putting up a 10-stamp mill to be run by electricity, for which a foundation has been laid, and the lumber will be sawed out by the sawmill which the company has built. There is quartz in sight from two years' prospecting to justify putting up a quartz mill.

### Trinity County.

(Special Correspondence).—The property on Quimby creek, which Beall & Temple sold to San Francisco parties, is under development and showing promising values. At the surface the ore is free milling and at 135 feet in depth, where the ledge is 15 feet wide, shows sulphurets with average value of \$14 in gold. The owners have a 10-stamp mill on the ground which will be set up and arranged for winter operations.—The Camp Smith claim is being prospected by parties who report having struck a 3-foot gold-bearing ledge in granite and porphyry.

J. E. Blair of Weaverville reports from the New River mining district. Manager Keith of a zinc plant at Denver, Colo., is negotiating for a copper proposition on Quimby creek. This property consists of six claims, three of which extend for 4500 feet on a ledge which is 30 feet in width and in granite and limestone formation. The claims are owned by J. R. Blair et al. Beall & Temple own claims in the same locality, the ore assaying \$10 in gold and 10% copper.

On China creek, a tributary of New river, the hydraulics worked by sixteen men for San Francisco parties uncovered recently a porphyry dyke 100 feet in width by 700 feet in length, showing gold values in numerous seams. It is stated that the whole dyke carries values of \$8 in gold per ton. A 10-stamp mill is being built.

Weaverville, Aug. 23.

V. L. Fox, A. Reeves and D. Pierano, operating the George Klein mine near the summit of the Deadwood divide, near Deadwood, are shipping ore to the smelter.—Work on the road, which will connect Dedrick with the Mason & Thayer mines on Little East Fork, is progressing. There are fourteen men employed and about half of the road, which will be 4 miles in length, has been completed. There are twenty men on the payroll at the Globe mine, across the divide from Dedrick. They are getting out ore and running the 5-stamp mill. The development work leads directly through the mountain, and eventually all of the operations of the company will be carried on on the Dedrick side of the hill.—The Chloride-Bailey mines, with a 20-stamp mill on the creek and a 10-stamp mill on the mountain-side of the mine, are idle. Three men employed throughout the winter did considerable development work. The working tunnel is in 1000 feet. On resumption of operations at the Chloride-Bailey mine it is expected the two mills will be consolidated on the creek.

Weaverville reports say the La Grange Hydraulic M. Co., operating the La Grange hydraulic mine on Oregon Gulch mountain, between Weaverville and Junction City, will rebuild the flume which forms a part of the water supply system of the mine. Eleven miles of flume must be rebuilt. The company has bought a tract of timber land and a sawmill with which to cut the lumber for rebuilding the flume, but before the mill can be taken to the head of the ditch, where it will be set up, the wagon road up Stuart's Fork must be rebuilt for a distance of 10 miles and several bridges put in. The water supply system of the La Grange mine, which includes 11 miles of flume, 15 or 20 miles of ditch, a pipe siphon which carries water through a 30-inch pipe from a point on the mountain side 1100 feet above Stuart's Fork across that stream and up the mountain on the opposite side of the stream, 1000 feet above the creek, in addition to a tunnel 1 mile in length, driven to accommodate the system, was installed about eight years ago, said to be at a cost of \$1,500,000. Under management of P. Bouery, the La Grange mine has been yielding \$30,000 per month, the property being operated almost throughout the year.

The Lappin mine at Deadwood, under bond to J. Beatham, W. L. Wilson and

P. Hogan of Port Hudson, Mich., is being worked by Superintendent F. Hollingsworth. J. Beatham is manager for the company. The Lappin mine comprises eleven claims, two of which are patented. The mine is said to be favorably located for working, with plenty of timber and sufficient water for mill and mining purposes. Most of the work heretofore done on the property has been in the nature of prospecting and development. There is an ore body in sight for stoping and the extension of the lower tunnel will open up another body of ore. The company will increase development work. A stamp mill is proposed.

**Tuolumne County.**

The incline shaft at the Mohican mine, near Groveland, is 320 feet below the tunnel level. Stations have been cut at a depth of 200 and 300 feet and drifts are being run north and south. Three 8-hour shifts are sinking the shafts. Two more machine drills will be put into the mine. The 5-stamp mill is running steadily. Thirty-two men are employed by F. Chappellett, superintendent.

At the Beehive mine on Table mountain, near Tuttletown, twelve men are employed, and the cement gravel mill that has been put up was started last week.

A diverting dam is being built on the main Tuolumne river, near Groveland, by the Garner M. Co., for conveying water into a flume and thence to the company's mines on the north river hillside, below the Lost Fox mine.—The Pennsylvania mine at Cherokee, near Carters, is being unwatered, says D. B. Neagle, owner.

It is said the Vine Springs mine, near Columbia, will resume operations.—The App mine at Quartz is running full-handed and the 60-stamp mill is crushing steadily.—In the Soulsby mine at Soulsbyville the shaft is down 400 feet. High-grade rock is being extracted at that level south. The shoot that was worked at the 300 is being opened on the 400.—In the Santa Ysabel mine, near Steat, the main shaft is sunk 650 feet. A station has been cut at the 400-foot level. It is intended, says Manager E. C. Loftus, to open the same and exploit thoroughly. The shaft will be continued down.

W. H. Martin of San Francisco has a bond on the New Albany quartz mine and its extensions, near the Grizzly and Lady Washington mines, on the North Fork of the Tuolumne river, near Carters. Superintendent W. Connolly has development work under way.

**Yuba County.**

The two dredge mining machines of the Hammon Co. on the Hallet place, 10 miles east of Marysville, are at work. Manager W. P. Hammon says the second machine has been set to work, as there is sufficient electric power.

**COLORADO.**

**Boulder County.**

The Chicago-Bird's Nest M. Co. has granted a lease to H. D. Fulton of Denver for one year of the Bird's Nest mine, on Spencer mountain, near Eldora. The mine is equipped with machinery. The vein is 2 feet wide and is said to be free from waste. Fulton is pumping out the surface water, and as soon as the shaft and levels are clear men will be put to work taking out ore.—R. Lee et al. have a lease on the eastern end of the Red Bird, on Spencer mountain, and will increase work. The mine is owned by J. W. Bowles of Littleton.

**Clear Creek County.**

Manager E. J. Wilcox of the Waldorf M. Co., operating the Stevens property near Silver Plume and other holdings in East Argentine district, says a large amount of ore is blocked out. The construction of the electric line for supplying power for the Stevens mine and mill is under way. The line will be extended from the Stevens over the crest of McClellan mountain to furnish power for the Wilcox tunnel, which has been driven a distance of 3100 feet. Three more jigs have been put in operation at the Stevens mill, and its capacity will be further increased by addition of more jigs. Arrangements are being made for carrying on development work in the mine below and above the tunnel level. Below the tunnel a streak of mixed lead and zinc ore is showing, and it is thought by extending the upper levels into new territory other large bodies of ore will be found. The erection of another mill for treatment of ore exposed in the Waldorf properties is said to be under consideration.

**Chaffee County.**

At the Jim Elaine mine, at Sherrod, owned by H. Whitehead et al., a hoist and pump are being put in to unwater the shaft. The ore carries values in silver and gold.

**Custer County.**

A small streak of high-grade copper ore

has been opened in the Rappahannock mine at Rosita. The copper ore is being saved and shipments will be made.—The lessees operating at the 500-foot level of the Bassick mine are extracting telluride ore.

**Dolores County.**

H. Obendorfer and J. Erler are developing their California group of mines, on Expectation mountain, near Rico. J. Holzner of Bisbee, Ariz., is also interested in the property.

Dunton reports say that in running a crosscut from the main tunnel of the Smuggler group of mines, which is being worked by A. J. Horlick and the Milwaukee G. M. Co., a body of ore 10 feet in width has been cut. The ore is said to be of shipping quality.—A. C. Krez has a lease and bond on the Iron Mine lode near Rico, and has let contract for development work.

**Gilpin County.**

Arrangements are made for starting up the Pewabic and Federal group of mines near Russell Gulch by a company of Eastern and California men. They will operate the property as the Pewabic Con. G. M. Co., and J. C. Fleschhut of Central City will be in charge. Manager Fleschhut intends giving a contract for sinking the Federal shaft at least 100 feet, its present depth being 275 feet, and also a contract for extending the lower levels east and west of the shaft.

Arrangements are made by the New York and Colorado owners for starting up the Dallas property on North Clear creek, near Central City. It is also reported that the same parties will resume operations on their Pleasant View group on Gunnell hill, where it is expected a new shaft will be sunk.

**Gunnison County.**

The Lakeview group of ten claims, near Tin Cup, has been sold to H. M. Gilbert et al. of Cripple Creek. The Lakeview has a showing of gold and lead ore opened up in several places. Development work will be conducted by tunnels.

Contracts are completed by which the Colorado Fuel & Iron Co. gains control of the Lewis iron mines at White Pine, containing estimated ore bodies of 50,000,000 tons, says the Chieftain. The company has a lease on these iron properties for twenty-one years, the minimum amount to be taken out each year being 75,000 tons. The terms of the lease are not made known, but it is supposed from the minimum amount to be taken out the Lewis royalties will be \$11,000 or \$12,000 a year. The Pueblo furnaces of the company are using 2500 tons of iron ore a day, nearly all of which they are shipping a distance of 500 miles from properties in Wyoming and New Mexico. If the White Pine mines contain the estimated tonnage of ore they will ship from there as soon as a road can be completed into the camp. The operation of the mines and a railroad will make it possible for other idle properties to work. The Denver & Rio Grande has surveyed a road from Sargents to White Pine, but it is thought the road will be built in from Salida by way of Marysville and Garfield, crossing the Continental divide on to the Tomichi, 3 miles above White Pine. Besides giving a shorter route that would give a 3% grade. The Lewis estate also owns iron mines in the Cebolla valley and it is said the Colorado Fuel & Iron Co. will get these as well as the Tuller & Riley properties in White Pine. The White Pine district has been producing zinc, lead, silver and iron ore from shallow workings. The Akron Co. is in with a tunnel 4000 feet long and cutting several veins on the May Mazappa and North Star mines, besides unwatering them and making it possible to increase work. Besides these are the Tuller & Riley, the Spar copper, the Edie and Eureka, the Clover mountain, the Comstock and other properties. J. D. Gilchrist is superintendent of the Colorado Fuel & Iron Co.

Gunnison reports say the mining industry of the county is improving. Pitkin and Ohio City are experiencing benefit from the mining companies now developing properties in the Gold Brick district. The Raymond M. Con. Co. is driving its tunnel to cut the Raymond vein at a depth of 1500 feet. The tunnel is in 1000 feet and has cut four leads of ore, varying in width from 2 to 5 feet and assaying from \$40 to \$70 per ton in gold principally. In the same district the Gold Link M. Co., operated by A. E. Reynolds, is driving a tunnel to cut practically the same leads as the Raymond and also the Sacramento vein, which has produced 3000 tons of ore. The Golden Islet M. Co., composed of Kansas City, Mo., men, has bought the Golden Islet group and is pushing developments on the same. The mill will start treating ore next week. Ore running thirty ounces in gold has been taken from the Golden Islet. In the silver belt at Pitkin the Colorado S. & M. Co., of which A. E. Reynolds is manager,

is increasing developments on a tunnel under the Mineral Farm basin. In the basin are the Maid of Athens and Citizen mines. These two properties are producing 300 tons of ore per month, which is going to the Denver smelters. J. C. Teller is operating the Red Jacket mine and expects to be shipping ore next month. The Tin Cup district is active and is producing considerable ore. The West Gold Hill M. & M. Co. is completing a fifty-ton mill at its properties on West Gold hill and will have it in operation next month. The company has opened ore bodies 40 feet wide near the surface with a value of \$12 per ton. The Woods G. M. Co., which represents Kansas, Mo., men, is completing a milling plant to handle gold ore from its mining property in Pieplant gulch, on the east side of Taylor park. The ore bodies opened are large.—The gold belt south of Gunnison, including Vulcan, Spencer, Dubois and other camps, is receiving attention and systematic work is going on. The milling plant recently constructed at Vulcan to treat the low-grade ores of the Goodhope and Vulcan mines will be in operation next month. The Continental mine has shipped a car of ore which returned a value of \$1000 for the carload.

The boiler has been placed on the Gold Links mine, near Pitkin, in the gold belt, and the compressor is being set up. An office building and tool house are up. A water line will be laid this week. Superintendent Pearson says he expects to have everything ready to start the tunnel by Sept. 1.

**Lake County.**

Work will be resumed on the Jay Gould group, near Leadville, next week. The property has been idle for the past fifteen years. Manager Pogue, who has been operating on the Russia, has arranged for starting work on the Jay Gould. He has a body of low-grade ore on the Russia which has been developed. The building of a mill to handle the ore from the Russia and the Jay Gould is being planned.

A new ore shoot has been opened in the Peerless Maude mine in the Horseshoe district, near Leadville. The Peerless Maude is one of a group of claims being worked by H. Dyatt. Shipments of ore have been steadily made from the group, principally from the Peerless Maude during the past few months. The mines are near the location of the eastern portal of the proposed tunnel planned by J. A. Shinn, and when that tunnel shall have been completed the ore which is now being sent east to railroad points on the other side of the range will be diverted to Leadville as the nearest shipping point. The new shoot in the Peerless Maude lies west of and parallel to the ore body which has been previously worked. Its values also are in silver and lead. In the lower level of the Peerless Maude, at a depth of 160 feet from the surface and 25 feet from the shaft, stringers of ore were found which ran high in silver. Dyatt started a drift 50 feet higher up in the shaft, and 25 feet from the shaft the drift broke into the top of the ore shoot. The vein was found to extend from northeast to southwest. The drifting will follow the shoot lengthwise through the Peerless Maude claim and through virgin ground.

In Little Frying Pan gulch, on southwestern slopes of Sugar Loaf mountain, near Leadville, considerable ore of fair grade has been taken out and steady shipments are reported. The Golden Curry, which is being operated under lease from H. R. Pendery et al., is the largest producer. The ore body has been opened up in the breast of the tunnel. Below the Golden Curry is the Venture, which is being worked by Superintendent Kavanaugh. He is taking out ore and is doing exploration and development work. The T. L. Welsh mine, under lease to Leadville parties, is being developed. There is a large body of low-grade ore in sight, but this is not being taken out as yet. The lessees are drifting for a body of high-grade sulphuretted ore thought to extend through the property. Shipping is expected to resume next month.

Leadville reports say the London mine of the Mosquito range section is producing ore that carries high values in gold. Since last winter only enough has been shipped to pay the running expenses of the mine, but the output will be increased. The lower tunnel has been driven in 3500 feet. The width of the vein varies but little and the values are uniform, says J. Kuehn, manager. As large bodies of ore are opened up it has been decided to increase shipments and more men have been put to work breaking ore. The average value of the product runs \$80 gold per ton.

**La Plata County.**

(Special Correspondence).—C. Newman, of Durango, part owner of the Ruby King mine, near Oro Fino, says he has put down an 80-foot shaft and has let a contract to crosscut from the bottom of the

shaft, a distance of 20 feet, when he expects to strike the vein.

**Durango, August 21.**

(Special Correspondence).—The Durango Girl G. M. & M. Co. was recently organized with A. Cornforth president, G. Olbert, A. D. Leimer and J. Olbert officers, and E. A. Ritter consulting engineer. The property of the company is at the headwaters of Junction creek, about 13 miles northwest from Durango. The mine is on the slope of Lewis mountain and embraces nine claims. Two of the claims, the Durango Girl and New Hope, are patented. The mine is opened by a tunnel 650 feet in length with crosscuts. A contract has been let to drive the tunnel 100 feet additional and when that is completed the company will put in power drills and do the work on company account. The mine has produced some good ore. They have a large amount of milling ore which will be left in the stopes until a mill is built on the property.

**Durango, Aug. 22.**

**Larimer County.**

C. S. Foote of Pearl says several mining companies operating in Pearl district have merged their interests to such an extent that a joint smelter is in course of construction for treatment of ores of the mines in the combine, the plant to have a daily capacity of ninety tons and to cost \$250,000. In the merger are the Coldwater Co., the Swede Co., the Big Horn and several others. At the Wolverine mine of the Coldwater Co. there are stored 150 tons of ore which will run 40% in copper, the ore being copper glance and gray copper, and of this quality and character of ore they report a 7-foot body in the mine workings. At the Swede mine the working shaft has been sunk to a depth of 1000 feet on ore, and the property has been further developed by a 1000-foot tunnel. The ore in that mine is of low grade.

**Montrose County.**

Montrose reports say C. Westerfield of Philadelphia, Pa., has bought La Sal copper mine in Paradox valley, Montrose county, for \$255,000. The former owners in the company are J. McBride, S. M. and L. Gates, H. T. Goober and W. A. Cashill and first payment of \$125,000 made. It is said to be a dry mine and well situated for development.

**San Juan County.**

(Special Correspondence).—The Gold Tunnel & Railway Co., operating the Highland Mary mine, near the head of Cunningham gulch, has fourteen patented claims on King Solomon mountain. One and one-half mile comprises the underground workings. The vein averages 3 feet in width. When No. 5 tunnel is completed it will cut the vein 2500 feet below the surface, which it is said will be the lowest workings in the district. The lake which supplies the mill and power plant with water for power holds, when full, 53,000,000 gallons of water. The pipe line is 5100 feet in length and is made of 16-inch steel, riveted pipe. The fall is 930 feet. Work is being done in the mine by air drills. As soon as certain improvements are completed in the mine to facilitate handling ore a night shift will be put on in the mill. The mill is handling sixty tons per day. Some crude ore is shipped direct to the smelters. A canvas plant is being added to the mill and if the experiment proves a success slime tables will be put in. The mill was erected above the tunnel entrance in order to escape the path of a snowslide which comes down each year, and on this account it is expensive handling the ore, as it has to be hauled to the top of the mill from the ore bins below the tunnel. This will be overcome by means of the new tunnel being driven. The plant is 9 miles from Silverton and about 5 miles from the railroad at Howardsville. J. A. Snedaker is consulting engineer and T. Graham manager, J. J. Morris mill superintendent and W. E. Wilson mine superintendent.

Two miles below the Highland Mary mine, in Cunningham gulch, is the Pride of the West mine, under lease to E. Smith of Los Angeles, Cal. C. W. Denison, manager of the property, is erecting a dam in Cunningham gulch and will utilize the power for air compressor and electric lighting. The property is on Green mountain and comprises eighty acres and millsites and mill at Howardsville, on the Animas river, 2½ miles from the mine. The mine is extensively developed by surface workings to a depth of 160 feet and a crosscut tunnel. An aerial tramway connects the upper and lower workings. In Cunningham gulch the Green Mountain M. & M. Co. (see front page) is owner of twenty-one claims developed by two parallel crosscut tunnels 1200 feet apart.

They have cut two veins, the first 300 feet from the Lawrence tunnel showing ore 5 feet wide that averages \$8 per ton, and the Osceola vein is cut 600 feet from the portal of the tunnel and averages 20

feet wide and \$12.50 per ton in gold, silver, copper and lead. The plant is equipped with 10-drill Rand compressor, Leyner 4-drill compressor and 150 H. P. boiler and one 60 H. P. return tubular boiler. They are installing water power from Cunningham creek, where they have a fall of 384 feet, and will put in a water wheel and electric plant for lighting the mine. The mine is 2 miles from the railroad and the shipping point is Howardsville. A 150-ton mill will be built this fall or early in the spring. F. J. Frost is superintendent.

Howardsville, Aug. 21.

(Special Correspondence).—The Venetian M. Co. owns twenty-six claims on Anvil mountain and is running a crosscut tunnel which will cut a majority of the veins at considerable depth. The company has a Durkee electric drill in operation. The tunnel is in 490 feet and will be driven 1400 feet to cut the ore shoot which shows on the surface. Power is developed from Cement creek. O. O. Larson is superintendent of the property. The mine is owned by Chicago, Ill., men. Gladstone, Aug. 21.

(Special Correspondence).—The power house, bunk houses and lower terminal of tramway of the Royal M. & I. Co. (see page 141), are on the Animas river, 2 miles below Silverton. The mine is across the river from the power house and on Sultan mountain. The company has 3000 feet of work done in the lower tunnel and 1500 feet in the upper workings. A raise is being driven to connect the lower workings with the upper which will be 600 feet on the King vein. They are also drifting on the Zeppa, from which they are taking gray and yellow copper ore showing ruby silver. A large percentage of the ore is mill dirt, but considerable ore is being shipped to the smelter. The tramway is 1200 feet in length and the lower terminal is on the D. & R. G. R. tracks.

W. R. Pyke, superintendent, states they are increasing development work, and when they have the mine well opened up a mill will be put in.

About 5½ miles up Cement creek is the Mammoth tunnel, operated by the Stony Pass M. Co. This tunnel is in 879 feet and is 7½x8 feet in the clear. When completed, it will be used for transportation purposes as an outlet for the ores from the company's mines in Prospect basin. They report making on an average of 3 feet per day in the tunnel with the Gardner electric drill recently installed. It is proposed to install a power plant, water wheel, etc., on Cement creek to develop power for working the company's mines in Prospect basin. The company also owns several claims on Mt. Bross, near the Gold King mine, and other claims on Green mountain. A. A. Brown is manager.

Silverton, Aug. 22.

(Special Correspondence).—Eight miles north and west from Silverton, up Mineral creek, on the Silverton & Red Mountain Railroad, is the Silver Ledge mine and mill, owned and operated by the San Juan M. & L. Co. J. B. Warner is manager. The mine is on Lookout mountain, which is an extension of Red mountain. The property consists of sixteen claims and two mill sites. The mine is 3000 feet from the mill and is connected by an aerial tramway. All the work is done through a 500-foot shaft on the property. A crosscut is at each 100-foot level, cutting two veins to the east and one to the west of the shaft. The ore occurs in parallel fissures running lengthwise of a rhyolite dike. The ore is zinc, iron and lead sulphide occurring in shoots from 100 to 160 feet in length and 6 to 15 feet in width. The mine is producing 200 tons of ore per day, all of which is treated in the mill. The ore is crushed in a 10x20 Blake crusher and fed into 16x36-inch rolls and crushed to ½ inch and then elevated into storage bins. The crushing capacity of the mill is 200 tons in ten hours—the day shift storing ore for night milling. From storage bins the ore is fed to two 6-foot Chilean mills. It is then crushed through a 25-mesh screen and elevated to hydraulic classifiers by spiral sand pumps. The product of each Chilean mill is distributed to five Wilfley tables from which a 50% lead product is produced and the middlings fall over the side of the table directly onto a small table patterned after the Wilfley, 2½ by 6 feet. On this small table the iron is taken out and the middlings, consisting of iron, zinc and silica, together with the heaviest product from the large table, are carried to another standard size table, where more iron and lead are taken out; the middlings are fed onto a small Wilfley on which the zinc is separated from the silica. This product carries about 30% zinc and 15% iron which is elevated with a conveyor into a rotary dryer to be dried for treatment on Blake electric separators. The product is distributed to four Blake separators, where the separation of the zinc

and iron is completed. The iron product from the electric machines is mixed with the iron concentrates from the tables and shipped to the smelters. The zinc product, which is 50% to 52% zinc, is shipped to the zinc smelters. The process throughout the mill is automatic, from the time it is dumped into the tramway bucket until it is loaded into the cars. The mill (see front page) is at the town of Chattanooga.

Chattanooga, Aug. 22.

The Excelsior properties near Hancock gulch, near Silverton, have been taken over by a company of Denver men, with M. Smith at its head.

#### San Miguel County.

S. D. Nicholson and Leadville men have leased the Smuggler-Union property at Telluride and have taken charge. The Smuggler-Union is thoroughly developed and equipped with machinery. It contains extensive bodies of low-grade ore. It has mills at Pandora.

#### Summit County.

The foundation for the additional twenty stamps that are going into the Cashier mill at Breckenridge is completed. With forty stamps Manager Wood says he can handle the product of the mine without crowding the mill.

One-half mile from Breckenridge, in French gulch, the Reliance G. Dredging Co., under Superintendent E. L. Smith, has work under way. Materials and machinery are arriving on the ground. The dredger is expected to be completed and ready to handle the placer beds in French gulch by next spring.

At the Admiral mine, in the Ten Mile district, near Breckenridge, drifting on the Frank vein has cut at a point 1000 feet from the mouth of the tunnel a 2-foot streak of \$80 gold ore. This is the second vein struck in the tunnel, while its destination lies 1000 feet ahead, says A. C. Frost, president of the Admiral Co.—A centrifugal pump has been set in the bottom of the Gold Pan pit, at Breckenridge, to handle the seepage water. The pump is driven by electric power from the Spruce creek plant. This leaves all of the present limited supply of water free for hoisting gravel.

Equipping the Jessie mine, near Breckenridge, with machine drills, new tracks and new timbers (where needed), and overhauling the mill, with the addition of three concentrating tables, is under way, necessitating almost complete cessation of mining and milling operations during month of August. The new air compressor, weighing fifteen tons, is a double cross compound machine with 16-inch cylinder. Manager Griffith, with it, bought 3000 feet of steel tubing for the air line. Pneumatic hammer drills will be used.

W. B. Le Wald, manager of the Ohio and Pennsylvania mines, at Argentine, reports the properties are improving. He employs forty men in mine and mill. About one-third of the product is sent direct to market from the mine, and the other two-thirds is concentrated at the mill. The mill, heretofore run by water power exclusively, is being fitted with steam power, so that it can be used all the year round instead of during summers only.

#### Teller County.

The Mary McKinney Co., operating on Raven hill, Cripple Creek, has opened up two more ore bodies. While doing development work between 500 and 600 feet north of the shaft, at a depth of 600 feet, the men cut an ore body, and the entire vein, which measures 3 feet, will return smelter grade. On same level and about same distance south of shaft, an ore body 2 feet across was also opened up which is proving a shipping proposition. It has only been a short time that the company has been able to work at the 600-foot level on account of water, but since drainage by El Paso tunnel this level has been dry.

The Cripple Creek & Pueblo Railway Co. will resume operations in the Ophelia tunnel near Cripple Creek. It is said the breast of the tunnel will be driven to the east slope of Bull hill. The breast of the Ophelia tunnel is 1½ mile from the portal. If it cuts Bull hill, it will cut it at a depth of 1500 feet, which means drainage and transportation for the mining companies.

Cripple Creek reports say all the dumps of the properties of Stratton's Cripple Creek M. & D. Co. on Bull hill have been leased and are being worked. The last lease granted was on the dump of the Nightingale mine, which is taken to show that the company does not intend for the present at least to lease any of the underground workings. G. Balderson, formerly manager of Stratton's Independence mine, was lessee of the Nightingale dumps. It is thought the dump ore will return values of one ounce gold to the ton.

The Cripple Creek Gold Temple Co., operating the main Gold Sovereign shaft near Cripple Creek, will sink the shaft to obtain additional stopping ground. The

ore body where they are breaking ore in the bottom level measures 36 feet in width.

The Findley mine at Victor is shipping an average of sixty tons of ore per day which gives average returns of \$25 gold per ton. The company is employing 110 men. All of the ore is being mined between the tenth and fourteenth levels. The veins in each level are wide and machine drills are breaking it down. The Shurtloff is mining from the seventh level down. The grade of ore in the Shurtloff is higher than in the Findley, although the tonnage is smaller. The Shurtloff management has sixty-five men steadily at work.

#### IDAHO.

##### Blaine County.

Supplies are going into Mackinaw gulch in Copper basin, near Hailey, to begin work on the Mackinaw group of copper claims, in which E. Daft, of Hailey, is interested. Daft has charge of development work and will sink an incline shaft 100 feet on one of the claims. He says that there is exposed a vein of 4 feet of ore carrying 12% in copper, besides values in lead and silver.—J. Peterson, operating the Blue Bird group near Muldoon, says he has uncovered a body of lead ore. In an open cut he has a body of carbonate and solid galena, which has been penetrated 15 feet.

##### Boise County.

The officials of the Lincoln mine, at Pearl, have the matter of building a smelter under consideration. The mine is equipped with a mill and from it concentrates are shipped to Salt Lake City, Utah, but due to disclosures of high-grade ore it has been concluded it would be a matter of economy to provide the mine with its own smelting facilities. J. T. Hodson of Salt Lake City, Utah, is manager of the Lincoln.

J. B. Coats of Atlantic City, Ia., president of the Oxbow M. Co., which is driving the Oxbow tunnel, near Idaho City, says the company owns 5 miles of the river bed. Two miles of it will be worked after the river is turned through the Oxbow tunnel. A flume will be built from the tunnel to carry the water, which will enable the company to work the 3 miles of ground below the Oxbow. Coats expects the water will be turned through the tunnel about October 1. Four machine drills will be put into the tunnel next week.

N. W. Lowman, operating at the mouth of Clear creek, near Idaho City, says the Magnolia mine on Miller mountain is taking out ore which mills over \$10 a ton. The ore is taken from an open surface cut, 150 feet east of the point where the ledge was tapped in the lower tunnel. The ledge is 4 feet wide. A drift was run 150 feet east from the lower tunnel, but has not reached the shoot, which is thought to dip east and will be tapped by extending the drift. The company is running a raise from the drift to the surface. Lowman says Payette river and Clear creek are lower than they have been for several years past.

##### Custer County.

At the Lost Packer mine on Loon creek, near Hailey, M. Finlen, of Butte, part owner, reports it is intended enlarging operations. A sawmill and an air compressor plant will be installed and the number of men increased. The company is building a road from Custer to the mine, which will be completed September 15. The maximum grade is 10%. The ore values are in gold and copper.

##### Idaho County.

Thunder Mountain region is to be equipped with another mill with which to reduce its gold-bearing ores by the Twentieth Century M. Co., controlled by Cleveland, O., men, says H. B. Fulton of the company. The plant is to be equipped with thirty stamps to begin with.

Roosevelt reports say general activity prevails over the entire Thunder Mountain camp. The Sunnyside mine has a payroll of 258 men. The Dewey and H. Y. have a large number. The Thunder Mountain Lightning Peak Co. and the East Dewey are having their work done by contract. The Sunnyside has sixty men building a wagon road from the mine to connect with the Dewey and H. Y. mines. It will be extended to the State road, which is within 19 miles of Roosevelt. The companies on Big creek are considering two roads—one from the south and the other from the north of the State. The P. & I. railroad will extend its line to Meadows, and possibly Warren. There is a good road from Grangeville. The Dewey mill is working steadily, with satisfactory results.

##### Kootenai County.

Manager M. W. Caldwell of Clarks Fork reports opening copper ore 12 miles from Clarks Fork in the Queen of the Lakes mine. It is reached by boat on Lake Pend d'Oreille.

##### Lemhi County.

W. H. Goss of Salmon City reports arrangements have been made between the American S. & R. Co. and the Gilmore mine, in Texas district, 80 miles from Dubois, on the Oregon Short Line road, as a result of which the ores from the mine will be shipped to Salt Lake City, Utah, for smelting. The Gilmore mine is sending ore to Dubois by means of twenty-two 10-horse teams. The ore from the Gilmore, says Goss, is netting its owners \$25 a ton after deducting wagon haul, transportation charges, sampling and smelting costs.

##### Owyhee County.

At South Mountain, near Silver City, work is progressing on the Standard Co.'s group, and they report opening their vein of high-grade carbonates for a length of 200 feet, and have a shaft down 45 feet, the ore running 40% lead and eighty ounces in silver.—At Wagontown, near Silver City, the Scales cyanide has completed treatment of the tailings dump and the final clean-up is being made.

##### Shoshone County.

Wallace reports say men are working on the Laclede M. Co. property, adjoining the Hercules mine. Buildings and other equipment for development will be put up.—The middle crosscut tunnel of the Iron Crown M. Co. is in 190 feet. It will require an additional 55 feet to strike the ledge. The miners are working in mineralized quartzite. Values in gold, silver and copper were found in the shaft sunk on the lead.—The lower contact tunnel of the Echo M. Co. is in 500 feet and nearing the ledge.

Reports from the King of Pine Creek group, near Wardner, say in a tunnel run 175 feet, 5 feet of milling ore has been cut at a depth of 80 feet. For nearly the entire distance the tunnel has been driven on the ledge. The croppings can be traced to summit of the mountain, and by continuing the tunnel a depth of 1000 feet can be obtained. The property is 3 miles from the Pine Creek spur. A good wagon road has been built to the property. The company is planning extensive development work during the winter and is erecting buildings. Articles of incorporation of the company have been filed by G. S. Olson, J. H. Otto, E. C. Young, C. A. Solberg and M. Webster. E. Young is secretary and manager.

##### Washington County.

The Chicago & Idaho M. Co. has been organized and is doing development work on quartz properties owned by it on Cuddy mountain, 40 miles north of Weiser and 12 miles west of Council. The company's group is 3 miles northwest of the Bundy group, owned by Brown Bros. The main ledge is 20 feet in width and has values in copper and gold. More men will be put to work to explore the property during the fall and winter, preparatory to installing machinery next spring.

#### MONTANA.

##### Flathead County.

G. Walker, part owner of the Copper Reward group of claims on Cherry creek, near Libby, says work continues satisfactorily. They ran 70 feet of tunnel since spring. The Copper Reward group is composed of five claims. The principal work has been done on the Copper Reward. On that claim they have a tunnel in 400 feet. Of this 160 feet is a crosscut. About 125 feet vertically above the tunnel they have a shaft down 25 feet, and from the shaft have a 50-foot drift. In face of the tunnel, which is run from about the bottom of Cherry creek, there are 20 inches of clean ore and 18 inches of quartz. The vein is between slate and quartzite walls and is a fissure. The values of the ore are in gold, silver, copper and lead. It is also said to contain 5% in nickel.

#### NEW MEXICO.

##### Eddy County.

Every well drilled around Artesia this year has shown traces of oil, says the New Mexican. Two months ago, E. H. Baugh began boring for artesian water on Seven Rivers at a point supposed to be out of the artesian level. This proved to be true, as at a depth of 475 feet no water flow had been secured, although it is found at 150 feet a few miles east. At 350 feet oil sand was struck and the water so impregnated with oil as to be useless. As the drill went on down, the flow of oil increased. The Standard Oil Co. has had men in the field hunting for the oil field supposed to be east of the Guadalupe mountains, and has filed placer mining claims on 3520 acres of land lying south and west of the Baugh well. The country where the find was made is said to consist mostly of gypsum hills. Crystallized sulphur may be found on the surface, and croppings of brown sandstone where there contain enough oil to burn when broken open and a match applied.

NEVADA.

Elko County.

R. R. Ives, operating the Resurrection mine at Mountain City, says to reopen the ledges at greater depth they are sinking a double-compartment shaft. In addition to the Resurrection, the company has a group of claims traversed by two fissures in the granite and on which work will also be started. Of the reported suspension at the mill with which the Nelson group was equipped, Ives says it is that the mill may be remodeled, the plant to resume as soon as the changes are effected. Operations on the groups that have been acquired by the Newhouse-Peery Co. are progressing with satisfactory results.

Lincoln County.

T. J. Osborne, of Pioche, and P. Sheehan of Stateline, Utah, will begin work in the development of the Groom mines in Lincoln county. Although it is productive of high-grade ore, it could not be worked to advantage and profit on account of the long wagon haul to a railroad shipping point. The building of the Salt Lake route through Nevada, however, has changed local conditions. It is expected the railroad company will ultimately build a spur or branch into the Groom district. It is stated in the workings of the main property of the group there is a 9-foot body of ore, developed to a depth of 125 feet, that assays 40% lead and 18 ounces in silver.

H. Tarbet of Salt Lake City, Utah, manager of the Arrow M. Co., says he is preparing to increase development of the company's group of mines in the Arrow range.

The Iyanough mine at Camp Dupont, near Searchlight, is reported to have opened up 5 feet of high-grade ore by a drift in the foot wall and then cross-cutting. The company will build a road into the camp. The proposed road will shorten the distance to Searchlight by 3 miles and will avoid most of the washes, says Manager Thacher. He is increasing development work.

Lyon County.

As the result of two days' labor, C. J. Orth, of Dayton, reports having cleaned up gold to the value of \$177 in his kitchen yard. The find was made while Orth was digging a well. He has rigged up a 2000-gallon water tank for use in washing the dirt. The earth when worked over is turned back to the ground excavated and in this manner Orth expects to work out the mine and still have his home property.

Storey County.

The Best & Belcher M. Co., at Virginia City, J. H. Kinkead superintendent, reports on Sept. 1 the mine will be closed down temporarily and arrangements will be made to carry on work from the Sutro tunnel.

Washoe County.

In bottom of shaft on the Ora mine, at Olinghouse, 17 feet from croppings, they have gone into quartz 4 feet wide, assaying \$20. Crosscut will cut vein at depth of 100 feet vertical and is in 129 feet. They expect to tap vein at 168 feet if no change occurs in dip of vein. It is free milling ore. The Ora tunnel will be extended to the Forlorn Hope and Crown Point vein to drain same, and to permit hauling of ore from these properties, giving them a depth of 350 to 500 feet respectively. A vein of sulphides was cut in the Ora, being 35 feet in width.

OREGON.

Baker County.

A. M. Paul has bonded the Imperial group of claims in the Cable Cove district, near Sumpter. The Sumpter Sampling Works are being removed to the mine, and as soon as installed, will start treating the ore on the dump. Development of the property will also be taken up again.

M. F. Muzzy has begun work on the Marshall group in the McNamee gulch district, near Sumpter. Two claims comprise the group, the Marshall and Copper Chance, with a shallow shaft and a cross-cut tunnel of 35 feet that has tapped the vein. Work will be centered in drifting on the vein from where cut. The vein is 3 feet wide. Later a sinking plant will be put in.

Jackson County.

A. C. Hooper of the Mount Pitt Hydraulic & Quartz M. Co. says he is putting in machinery for the development of his ledge on Jump-Off-Joe, near Medford, which he has bonded from the Hydraulic M. Co. A small quartz mill and equipment is being set up.

Josephine County.

The 100-ton smelter being built by the Takilma Smelting Co., at Takilma, for the Waldo copper mines, is nearing completion, and is expected to be ready for its initial blowing in before Sept. 10. The

last of the machinery is being placed at the plant.

A. C. Hooper of Portland, manager of the Mount Pitt Hydraulic & Q. M. Co. properties, on Jump-Off-Joe river, near Grant's Pass, is superintending development of the property. He is putting in a mill and development plant. The ledge is 3 feet wide and carries values, largely in free gold.

Grant's Pass reports say an ore strike has been made by the American G. F. Co., at the Granite Hill and Red Jacket mines. Superintendent Wickersham says the mill is running steadily. The new mill handles ore from the Granite Hill and Red Jacket mines. On the former the main shaft is down between the 300 and 400-foot levels, and the 200-foot level is opened up with over 350 feet of drift and 60 feet of raises being carried to the 100-foot level. Machine drills are used. The cage used in the shaft is provided with extension guides for lowering below timbers, thus facilitating the shaft sinking. A pumping plant has been installed in the pump station at the 220-foot level, capable of pumping 370,000 gallons a day. The mill plant contains ten 1000-pound stamps, four Frue vanners, 80-ton crusher, a 65 H. P. engine, a 10 H. P. engine for concentrators and a six-drill compressor. An electric light plant is also in operation and the mine is lighted by it. The steam plant comprises three boilers, aggregating 200 H. P. The Red Jacket mine is being operated in conjunction with the Granite Hill. A drift constituting the present workings affords 70 feet of back at present face and drifting westward will increase it. The hoist and boiler formerly used on the Granite Hill are being moved up to the Red Jacket to continue work on the winze. Ore is now hauled to the mill by steam, but as the Red Jacket develops an aerial tramway will be utilized.

SOUTH DAKOTA.

Lawrence County.

The Deerlick M. & Dev. Co., owning an acreage of mineral bearing ground in Iron Creek mining district, 12 miles west of Deadwood, is preparing for opening up of work, says G. W. Nash, vice-president of the company.

Lead reports say an extension has been given in the deal on the Wasp No. 2 and adjoining properties in Yellow Creek district, south of Lead. The Venture Corporation of London, England, has an option on the group. The extension is given that further exploration may be done with a coal drilling apparatus which will explore the quartzite levels. It is stated the corporation will take in the deal the property of the Belt Dev. Co., which is south of the Homestake. A cyanide plant will be built.

For the year ending May 1 the Clover Leaf M. Co. at Roubaix has treated a total of 27,200 tons of ore which averaged \$5 a ton gross. The cost of pumping water alone for that time was \$28,908. There are seven levels in the mine, on four of which are pumps that force about 1000 gallons of water a minute to the surface. The mine last year paid above operating expenses \$11,000, and the mill will be increased to 100 stamps. At a recent meeting of the directors it was decided to sink the shaft from the 700-foot level to the 1000-foot level, which will open up additional ore. The ore is free milling. The cost of mining the ore was \$2.29, and milling 75 cents per ton. S. W. Russell is manager of the company and O. B. Amsden is superintendent. The mine is developed with 7700 feet of drifts and raises.

Pennington County.

Work in the placer mining district in the southern hills is reported active. The Elkhorn Bar P. M. Co. is carrying on work. Several new appliances have been put in and satisfactory results are reported. There are a number of other promising properties in the section near Silver City that are giving good indications as work continues.

UTAH.

Beaver County.

For the mill with which the properties of the Estella M. Co. near Milford are being equipped machinery is being placed, says Manager S. Tarbet. The trials made at the Baxter plant have shown that Estella ores, which have an average of \$10 gold per ton, can be made to afford a profit with amalgamation and subsequent leaching by cyanide process. The foundation for the plant has been completed, and, with five stamps dropping, twenty tons will be reduced daily.

Box Elder County.

The Sunrise M. Co., operating at Park Valley, is reported preparing to build a mill to handle its gold-bearing rock, says President S. Simon. Stamps and concentration will be used to recover the contents from the ore, which shows values of \$14 per ton. Manager A. Lochwitz is increasing development.

Salt Lake County.

So satisfactory has been the service of the electric locomotive in handling slag at the Bingham Con. smelter, at Bingham, that a third one will be put in. With the three in operation and a fifth furnace in commission, Superintendent Nutting will be prepared to increase the output.

Thirty additional vanners and four tables for the Utah C. Co. mill in Bingham camp, which will enable the management to reduce 750 tons of copper, gold and silver-bearing ore daily, are being set up. The framework for the additions to the main plant within which the tables are to be housed is completed, with the metallic roofing being put on. With the additional machines the vanners at the plant will have been increased to fifty in number, the tables to forty, with two slimers. Just when the next unit will be added to the plant, the ultimate capacity of which will enable the company to reduce 5000 tons of ore daily, has not been decided, says Manager D. C. Jackling.

Superintendent W. H. Nutting, of the Bingham Con. smelter at Bingham, says the fifth furnace will be ready to be blown in by October 1. The new sampler is doing its work satisfactorily. Meantime a large volume of ore continues to arrive at the bins.

From Yampa mines at Bingham there are going to the Yampa smelter in Bingham canyon 200 tons of ore daily, with this to be doubled when the capacity of the latter, for which contracts have been awarded, shall have been increased, says W. H. Craig, superintendent. In the production of the present tonnage no stopping whatever is being done, the ores coming entirely from development and the extension of the levels into the copper, gold and silver zone. Since completion of the main tunnel through which the ores are found the work has been in ore.

Plute County.

The Bradburn M. Co., of Marysville, has resumed work in its mines.

Work is progressing on the mill for the Sevier Con. mine in Gold mountain, near Marysville, and it is expected the plant will be ready to go into commission by October 15.

At Gold Mountain district, near Marysville, mining is progressing. P. W. Madsen, of the Madsen G. M. Co. at Gold Mountain, says the mine is developing satisfactorily. Additional force of men has been put on development work. At present they have drifted 500 feet on the vein, which, throughout, has maintained its size and richness. At the end of the tunnel the crosscut shows a vein 26 feet wide. From an 80-foot raise at end of tunnel ore is being taken. The directors propose building a mill.

Summit County.

To the output of Park City is being added the output of concentrates from the Comstock company's mill, which is again in commission, says Superintendent Hickey. He says a considerable quantity of high-grade ore has been coming from the mine and has accumulated in the ore house to the amount of 300 tons. At the mill one 10-hour shift will be worked at present. Hickey is drifting in the ore body, but progress is rather slow from the fact that all the product must be handled by windlass. There is still considerable water in the mine, so work must be concentrated to the one point. The mill has a capacity of 120 tons per day.

Tooele County.

It is reported W. B. McSherry, president of the Conner M. & E. P. Co., is preparing to build an electric power plant in Soldier canyon, 3 miles out of Stockton.

That its gold-bearing ore bodies may be resampled and provision made for recovery of their values, the Herschel company's mine at Mercur will be reopened this week and rock on which to try at least two new processes forwarded to Salt Lake City, says Manager J. Smith.

WASHINGTON.

Ferry County.

R. L. Boyle, president of the Keller & Indiana Con. S. Co., says he has machinery on the ground at Keller and preparations are being made for a smelter. The flume right of way is completed; 300,000 feet of timber have been cut and the sawmill is expected to begin sawing the logs into plank and timber for the flume this week.

Snohomish County.

Portland, Or., men are developing mines in the Index and Silver Creek districts of Snohomish county. The Smuggler G. & C. M. Co. owns the Achilles, Ajax, Smuggler, Pandora, Oriental, Red Cliff and Smuggler Extension. McK. Mitchell, of Portland, Or., is president and W. J. Walters general superintendent. The work so far done consists of 50 feet of tunnel. The breast is in ore showing average value of \$11. It is of a concentrating character. The Smuggler

is 2 miles southwest of Monte Cristo, where is located the Rockafellow mines, and 15 miles north of Index, on the main line of the Great Northern Railroad. The New York M. Co., adjoining the Smuggler, has started a sawmill that will furnish timbers for mining purposes and to build a mill. F. E. Sanders, of Seattle, expects to have in operation by April 1, 1905, a road to the district that will be constructed past the property. The home office of the New York M. Co. is at Vancouver, B. C.

Whatcom County.

Bellingham reports say the 6-stamp mill of the International G. M. Co., in Mount Baker district, will be operating in September, according to J. Templin, president of the company. The mill is at the Fraser river. The power plant is in place. The ore is said to be free milling.

WYOMING.

Carbon County.

A mill will be built for the Evening Star mine at Encampment.

The Dillon Con. M. & T. Co. will drive a 3500-foot tunnel, starting north of Dillon and crosscutting the country from north to south. H. O. Granberg of Oshkosh, Wis., is vice-president and C. De Witt of Dillon is secretary.

Laramie County.

Cheyenne reports say the Fairview mine in the Silver Crown district, 25 miles west of Cheyenne, will be sunk to depth of 1000 feet. The shaft is 157 feet in depth. The Fairview is owned by the Fairview M. Co. of Colorado.—The Colorado & Southern Railroad this fall will build an 8-mile spur from Silver Crown station to the mill at Hecla, for handling concentrates and ores. The principal ore treated at the mill comes from the Louise mine, owned by the Hecla C. & G. M. Co., and is of low grade.

Deeds have been filed for record showing that the Colorado Fuel & Iron Co., heretofore simply a lessee of the iron mines at Sunrise, becomes sole owner of the properties, comprising 10,000 acres. It is said the company pays \$1,000,000 for the Sunrise properties, which includes two shafts and several surface mines, where steam shovels excavate the ore, which is used in the manufacture of steel at the Pueblo, Colo., works of the company.

FOREIGN.

AFRICA.

Rhodesia.

The total gold output of companies making returns to the Rhodesian Chamber of Mines at Bulawayo for month of June is given at 20,402 ounces (Matabeleland 14,441 ounces, Mashonaland 5961 ounces). The returns for first six months of 1904 compared with 1903 were:

	GOLD.		SILVER.	
	1904.	1903.	1904.	1903.
January .....	19,859	16,545	3,521	.....

May, tons .....	35	May, tons .....	3,705
June, tons .....	34	June, tons .....	5,416

Transvaal.

Johannesburg reports say the output of gold, silver, coal and diamonds from the Transvaal during the six months of 1904 ending June 30 was valued at \$3,672,647, an increase of £950,031 as compared with the last six months of 1903.

ARGENTINA.

It is reported that the Compania de Sutphen de Lavaderos de Oro de Buenos Ayres proposes buying additional gold dredging machines, to be used in working its holdings. E. W. Sutphen of Buenos Ayres is head engineer of the company.

BRITISH COLUMBIA.

Boundary District.

M. Kane et al. have bonded the Silver King mine, in Skylark camp. It joins the Silver Cloud. Considerable work has been done on the property and there is high-grade ore on the dump. The mine is owned by F. P. Hogan of Spokane, Wash., A. N. Pelly, A. Ferguson, J. C. Douglass and others.—I. Skidmore has uncovered a vein of high-grade ore on the Humming Bird mine, which adjoins the E. P. U. on the north. He was working to crosscut the E. P. U. lead on his property.

East Kootenay District.

The approximate mineral production to southeast Kootenay for first six months

of the present year shows increase over 1903, says the Fort Steele Prospector. The North Star mine has shipped 800 tons of silver-lead ore. The St. Eugene mine at Moyie which was idle for some time is employing 300 men and is turning out a 68% lead concentrate at the rate of 100 tons per day. Since Jan. 1, 1904, south-east Kootenay has produced 16,000 tons of ore carrying the following values: Gold, 50 ounces; silver, 150,000 ounces; copper, 3000 pounds; lead, 4,000,000 pounds. At Marysville the Sullivan Group M. Co. is building a smelter which will be ready for operation this fall. On completion of the smelter the Sullivan mine will start operations, and the production is estimated at 200 tons daily. On the east side of the Kootenay river, in the main range of the Rockies, are a number of properties having ore on the dump which will become producers on completion of the Kootenay Central Railway.

#### Slocan District.

The daily output of zinc at the concentrators around Sandon is fifty tons. The Star alone turns out twenty tons every twenty-four hours.—The Silver Cord, above Cody, and the Dixie Hummer, near the Sunshine, owned by P. J. Hickey, manager of the Ivanhoe mine, are being worked.—The Mountain Con. has twelve men on the payroll. Work has been confined to driving an intermediate tunnel, which has tapped the raise. McLeod & Thomson, lessees, report that in drifting on the intermediate tunnel 500 sacks of ore were taken out while driving 60 feet. This came from the width of the tunnel alone, the vein being passed in order to tap the raise. They have built a hoisting station and put everything in shape for shipping. The developed ore bodies are being worked and a pack train will be kept busy packing down ore.

#### Vancouver Island.

(Special Correspondence).—The Tyee C. Co., Ltd., at Duncan's Station, reports returns for month of July: Smelter ran seventeen days; 3625 tons of Tyee ore treated gave a return, after deduction of freight and smelting charges, of \$48,878.

#### Duncan's Station, Aug. 20.

Repairs to the Western Fuel Co. pit-head works in Nanaimo are expected to be completed next week and work in the mines will then be fully resumed. In the meantime the opening of the new mine at Departure Bay is so far advanced that the driving of entries and stalls will be started.

At Alberni considerable mining activity is reported and two mines are ready to start regular shipments. The tramway of the Cascade Co. has been completed and 200 tons of ore are ready for shipment. The ore is said to be of high grade. The Southern Cross Co. is also ready to make shipments of ore. Work has not yet started on the Nahmint mines (the Hayes mines), but will begin next week. It is stated that \$60,000 have been provided by the owners for further development. Development work is progressing on the Happy John group, a lower tunnel being run to tap the showing of ore in the upper tunnel.

#### West Kootenay District.

Near Poplar, J. A. Magee, superintendent of the Spyglass mine, at head of Poplar creek, reports a shoot of ore carrying native silver has been struck in No. 2 tunnel on the Spyglass.

#### Yale District.

The bond on the St. Lawrence group of mines in Yale district, near Kamloops, has been taken up by C. F. Law of Vancouver and W. F. Armstrong, who will increase developments. There are three claims in the group and the vein has been opened by open cuts and shafts along the surface through all the claims, the deepest shaft being 55 feet. No ore has been shipped, as the claims are 80 miles northwest of Spence's, on the Canadian Pacific Railway, that being the nearest railroad point. The ore contains gold and silver and a little lead, and will be reduced by concentration. The ore body is from 4 to 8 feet in width.

At the mines of the Nicola Coal Mines, Ltd., Manager P. Bockmier of Spokane, Wash., says a drift has been run on the croppings and there is in the face a 7-foot vein of coal of coking quality. The claims cover six full sections, a portion of which is held by crown grants. The claims are in Nicola valley and are 150 miles from tide water. A contract has been let for continuing development work. Surveys for a railroad are being made through the valley. Seven American companies have secured claims in the valley and are prosecuting developments. The Kootenay I. & C. Co. is prospecting with a diamond drill plant. The coal basin is said to be surrounded by a mineral district containing deposits of copper ores, some of which are being developed.

The St. Lawrence group of mines, near Kamloops, has been sold to C. F. Law

and W. F. Armstrong, of Vancouver, for \$40,000. The properties are 80 miles north of Spence, on the Canadian Pacific railroad. Law & Armstrong had a bond on the group and have carried on development work, opening surface cuts and shafts. Ores sent out for test have shown average of \$60 per ton in gold and silver. The ore contains a little lead and will be handled by concentration.

### CANADA.

U. S. Consul-General W. R. Holloway at Halifax writes that the bounty of 1½ cent a gallon on crude oil recently granted by the Dominion government has stimulated development of oil territory and development of the New Brunswick oil field is increasing. A New Brunswick petroleum company has found oil in paying quantities in a district covering several square miles. The company has thirty-four wells producing at the rate of fifty barrels each of oil daily. This is in excess of the product of the Ontario wells. The company is multiplying its wells (eleven more wells will be producing next month) and erecting storage tanks. The storage tanks are being built between Memramcook station and the river. They will form the nucleus of the refinery to which the oil will be brought by gravitation through pipe lines; crude, refined and other oils and by-products will be dispatched by rail and water. The natural gas issuing from the wells in operation will be used primarily to operate the company's plant, but as the supply increases with the number of wells the gas will be piped to consumers.

### KOREA.

(Special Correspondence).—The annual report of Manager H. F. Meserve for 1903 has been issued by the Oriental Con. M. Co., operating mining concessions in Wunsan district, and gives the following summary of operations: The 200 stamps on the concession averaged 278 days full run out of the 365 days in 1903, "due to extraordinary local conditions," thereby cutting down the tonnage figures and increasing cost of mining and milling figures per ton. Development work in the mines also suffered from the same causes. [During 1903 a severe epidemic among the bulls in Korea left us without sufficient means of transportation for cordwood, mining timbers, etc. \* \* \* Labor was deficient during the year, as the scarcity and high price of rice and millet, due to the bull sickness, drove thousands of Koreans out of our district.] In spite of the above conditions, they reduced the operating costs per ton from \$2.73 in 1902 to \$2.225 in 1903. They worked out, during the year, a successful treatment of their Tabowie and Taracol concentrates by the cyanide process. The company's Maibong and Chittaballie mills were not taken down, as expected, but were run at a good profit for the year, and on January 1st, 1904, the ore reserve in sight at the Chittaballie and Charabowie mines was nearly the same as on January 1st, 1903, with the latter mine looking hopeful in the new lowest workings. The year's production of the company was divided among its mines as follows:

	Tons.	Total Value.	Cost of Milling per Ton.
Chittaballie	18,295	\$ 91,406	\$1 735
Tahowie	43,782	275,201	36 0 905
Taracol	75,972	563,661	19 0 740
Kuk San Dong, North	10,639	64,456	40 1 565
Kuk San Dong, South	10,653	37,500	73 1 335
Charabowie	27,065	179,098	74 1 355
Maibong	9,937	75,350	41 0 135
Tongkoll	2,007	74,150	33 2 335
Totals, by company	198,410	\$1,380,736	82
Totals, by tribute	5,157	98,219	96
Grand totals	203,567	\$1,478,956	78

The cost of mining includes all underground development work in the mines. H. C. Perkins of New York City, N. Y., is president of the company.

Puk Chin, Aug. 2.  
C. G. Dennis of Nevada City, Cal., of the Oriental Con. M. Co., says the company has a concession covering several hundred square miles of mineral territory in Korea. The company, which is composed of New York men, is developing or working 30 different mines, employing 2000 native Koreans as laborers and miners, governed and directed by a staff of eighty whites, both Europeans and Americans. The ores are quartz, 50% free milling, in fissure ledges in granite. The deepest shaft is 700 feet. Steam power is mostly used. An electric plant, with water for the initial generating power, is being built. They are cutting ditches constructing dams and storage reservoirs. The mines are 150 miles in the interior of Korea, in Wunsan district, and part of the time within the zone of operations of the Russian and Japanese armies. The Japanese drafted many of the company's native laborers into their transportation service, confiscating the bullock carts, and so crippling

the mines' working force that they had to temporarily close down.

British Vice-Consul Lay at Seoul writes that Japan practically takes all the gold bullion that Korea produces for export, which amounted to £556,985 in 1903. Exports for 1903 included:

Copper, pounds	409,066	£ 4,694
Gold ore	.....	14,247

### MEXICO.

#### Aguas Calientes.

The Guggenheim Exploration Co. has begun operations on the San Pedro mines, in Tepezala camp. The mines are copper producers.

#### Chihuahua.

Near the famous Cigarrero mine of the Sierra Almoleya district, between Jimenez and Parral, S. Rios, of Parral, owner of the Fragua mine, is straightening out the working. The mine has shipped 11-kilo silver ore, but is shipping nothing at present.—The Cumbre mine is shipping.—S. Rodriguez is principal owner.

—The Mina de Agua, now known as the Guatemoc mine, is in payable ore.—The Independencia mine is shipping. Stalforth et al. are interested.—N. O. Bagge, principal owner in the Almoleya M. Co., and manager D. W. Shanks are at the mines and increasing operations. The company will put in a 150 H. P. electric plant at Dorado to increase operations. Power is to be transmitted 5 or 6 miles to the several workings of the company.

L. M. Tidwell, W. C. Meyers and A. H. Couch, owning a gold-silver group at Guaynopita, 60 miles from Nuevas Casas Grandes, report the ores run \$15 to \$250 per ton Mexican money, and they will start work thereon next week.

It is stated the Lluvia de Oro gold-silver mine in Urique district, western Chihuahua, 6 miles from the Sinaloa mine, has considerable ore blocked out, and milling is under way. There are five properties included in the Lluvia de Oro group, one of which is the Cuatemoc. The initial run of the 20-stamp mill with its four concentrating tables was made in July and is in steady operation. A. J. Underwood is manager.

J. G. Hardy, manager of the Dolores mine at Dolores, in western Chihuahua, says he is putting in machinery for a 50-ton mill for the Dolores mine. A cyanide plant of equal capacity is to be built on the ground. This will be used for treating the low-grade ores, and the rich ores are to be treated in a 15-ton pan amalgamation plant. Part of the mill machinery is at Minaca and will be hauled out to the mine.

Dale Bros. & McDonald have their two pumps of 675 gallons capacity each per minute unwatering the Americano mine at Terrazas. Ore is exposed where the water has left it, and it is thought the caves are filled with bodies of ore.

It is reported that P. Alvarado, owning the Palmilla mine at Parral, has bought the Tres Rosas mine and proposes building a reduction works and a concentrating plant at Jimenez.

#### Guanajuato.

D. Furness of Guanajuato says it is intended, at the quicksilver mines of the Dolores M. Co., to put in additional machinery.

#### Jalisco.

Buckner & Whitney have been delayed by excessive rains in getting their reduction plant near Etzatlan in operation. It is expected to have it in operation by Sept. 1st. The equipment consists of a crushing mill, pans and settlers and cyanide process. The San Miguel mine will furnish the ores for the mill, and it is thought the owners will build another mill for the Zapopan mine during the coming year.

The United Mexican M. & S. Co. of Duluth, Minn., F. W. Page manager, has completed and blown in its quicksilver furnace at El Moral, near Mascota. The company owns four mines near El Moral.

The company composed of Pennsylvania men, of which N. Z. Seitz is manager, expects to have its reduction works in operation by September 15th. The company's mines are the San Felipe group, near the boundary of Jalisco and Tepic, near San Marcos. The power is to be electric, generated by water power from the Amajac river.

#### Mexico.

The manager of El Oro M. & R. Co. at El Oro reports for month ending June 30: Mill ran twenty-six days, crushing 8574 tons, producing from 100-stamp mill \$105,646, producing from old cyanide plant \$3966. The annual clean-up produced \$16,375. Total reduction, \$125,987. Working expenses and development were \$62,961. The profit from the railway for the month was \$5200. From that is deducted estimated monthly expenses in London and manager's salary, £700. There has been expended on permanent improvements, including \$16,285 expenditure on new mill, \$18,573. The manager says the

low tonnage for the month was caused by a break in the mill shaftings.

#### Nuevo Leon.

Texas men have organized in Laredo, Texas, the Laredo M. & S. Co. The company owns the La B. mine in Nuevo Leon. Operations are to be increased and a smelter built on the ground. The La B. mine is in Galliana district and is under the management of W. N. Banks.

#### Sonora.

Near Soyopa, at La Mina Mexico, A. Lott, superintendent, has the working shaft, an incline, down 670 feet, and reports taking out high-grade silver ores, which have been shipped, and has piled on the dumps second-grade rock, for reduction of which a smelter will be erected. The ore is sorted, and rock which yielded less than 150 ounces per ton goes onto the dump. The shipping ores run from 150 ounces per ton up to 600 and 700 ounces silver. La Mina Mexico has been in operation seventeen years, and is owned by C. Ortega and F. Monteverde of Hermosillo. The ledge is narrow, carrying lead and iron sulphides, also silver. The formation is quartzite, with a lime contact, but the ledge is in quartzite.

At the Swansea mine, 16 miles from Bacoachi, J. B. Tomlinson, principal owner, proposes to build a mill this fall. Development work is being increased.

P. Adkins of Norman, Okla., reports he has bought two gold properties 140 miles southeast of Nacozari, on the Rio Bonito, and expects about October 15 to start work on the mines.

The English, Alaska & Mexican M. Co. has bought 1000 acres of placer ground on the Yaqui river, near Buena Vista, and is preparing to begin operations. Machinery will be placed and it is expected that extraction of gold will start this fall.

At Los Coches the work of getting in the machinery for Los Coches M. Co. has been delayed by storms cutting out roads. Mine development continues steadily and bodies of gold are exposed, ready for stopping.—At the Marquesa mine, near Matape, two shifts are working and high-grade copper sulphides are being extracted.

R. E. Gayou has men on development work on a gold property within 200 yards of the track of the Sonora railway at Llano. It is said on account of its proximity to the track it is named Los Rieles (The Rails). Three veins, close together, pitching at an angle of 45°, are to be cut by a vertical shaft down 50 feet. One of them has been cut and the shaft is in the second. Each is 2½ feet wide.

F. Garretson, manager for the Garretson-Sahuaripa M. Co., which has properties near Calera, says a pyritic smelter, with a capacity of fifty tons daily, is being erected at Calera. It will be completed and ready to blow in by October. A small trial stack, made of adobe, was put up there by Garretson last spring and worked satisfactorily. The mines of the company are on the mountain overlooking the camp. The workings consist of several shafts and tunnels, most of them showing ore. Through granite and porphyry a 60-foot dike of diorite cuts across the ridge, and in this dike are said to be several mineralized sections, 18 inches to 6 feet in width, in which the diorite is impregnated with copper and iron sulphides, carrying gold and silver. In another working bismuth ores have been taken, assays yielding 4% of that metal, as well as copper and silver.—Three miles from Calera are the properties of the Buffalo-Sonora M. Co., of which F. Garretson is also manager. It is a lead-silver proposition. The pay streak is 3 feet in width and has a foot of "petasque," which is said to yield 1000 ounces silver per ton. There are four shafts (2000 feet between the two farthest apart), and they are all in ore. One is 210 feet deep, one 75 and two 60 feet each. In all some drifting has been done. The mines and the camp are connected by telephone.

#### Tamaulipas.

The American International Fuel Co. is preparing to drill two wells for oil at Los Esteros, on the Mexican Central railway, northwest of Tampico. W. E. Lucas is superintendent.

#### Tepic.

The rainy season is reported to have stopped the work of securing salt from the deposits on Las Tres Marias islands, opposite the port of San Blas, and also at Cuyutlan, near port of Manzanillo. It is reported that during the dry season just passed 9,000,000 pounds of salt were taken from the latter deposits. A smaller amount of salt was taken from the beds on the three islands off the Tepic coast. The Tres Marias were recently bought by the Federal Government, and as soon as provisions are made for long-term convicts on the islands, particular attention will be paid to the exploitation of the salt deposits.

Personal.

H. E. PICKETT, a mine owner of Nevada City, Cal., is in San Francisco, Cal.

J. B. OVERTON of Virginia City, Nev., is in San Francisco, Cal., on mining business.

H. W. TURNER of San Francisco, Cal., is at the quicksilver mines of Terlingua, Texas.

E. BAMBERGER, assistant manager of the Daily-West mine, Park City, Utah, is in the East.

F. HOLLINGSWORTH is superintendent of the Lappin mine at Deadwood, Trinity county, Cal.

J. R. FOCHT has accepted a position with the Amalgamated C. Co., at Anaconda, Mont.

W. P. HAMMON, interested in gold dredging at Oroville, Cal., is in San Francisco, Cal.

W. J. DOUGLASS, a mine superintendent of Virginia City, Nev., is in San Francisco, Cal.

J. W. TAYLOR of El Paso, Texas, is examining mines in the Sierra Madre mountains in Mexico.

F. A. STEVENS of the Zubiata M. Co. at La Colorado, Sonora, Mexico, is visiting in Philadelphia, Pa.

E. W. YOUNG of Denver, Colo., is at the Mystic Shrine mine at Bingham, Utah, in which he is interested.

H. N. BOWEN, for the past year superintendent of the Annie Laurie Co.'s mines at Kimberly, Utah, has resigned.

W. H. ALDRIDGE, manager of the Trail smelter, returned to Rossland, B. C., last week from Montreal and Quebec.

A. J. McMILLAN, managing director of Le Roi C. Co., returned to Rossland, B. C., last week from London, England.

H. TARBEK, of Salt Lake City, Utah, is manager of the Arrow M. Co. properties on Arrow Range, Lincoln county, Nev.

I. E. ROCKWELL, manager of the Minnie Moore mine at Hailey, Idaho, is in Salt Lake City, Utah, on company business.

S. LEVERETT, engineer for the Sunset Dev. Co., at La Barranca, Sonora, Mex., is in Tucson, Ariz., and will return to La Barranca September 1.

L. GLOCKNER of Salt Lake City, Utah, has gone to Kalgoolie, Western Australia, to accept a position with the Golden Horseshoe M. Co., Ltd.

H. SABIN, night foreman of Le Roi C. Co. smelter at Northport, Wash., has been appointed superintendent of the plant, vice E. J. Wilson, resigned.

J. H. MCCHRYSAL returned to Salt Lake City, Utah, last week from Custer, Idaho, where he has been conducting an examination of mining properties.

W. H. CHILD of the Sheba M. Co. returned to Salt Lake City, Utah, from its mines and mill in Humboldt county, Nev., accompanied by President Barch.

F. W. HOAR, former superintendent of the Old Dominion copper mine, is at Globe, Ariz., from Houghton, Mich., and about September 1 expects to open an office in El Paso, Tex.

C. JOHNSON, superintendent of the Skeleton Creek mines, in Wood River district, near Hailey, Idaho, who has been visiting in Salt Lake City, Utah, has returned to Hailey.

W. E. DEFTY and W. C. FOSTER of Phoenix, Ariz., manager and secretary, respectively, of the American-Mexican M. Co., are at the company's La Gran Providora de Cobre mines near Caborca, Sonora, Mex.

GAYFORD & CALLOW of Charlotte, N. C., have instructions from the Empire M. Co. of Pittsburg, Pa., and of Lytton mining district, North Carolina, to proceed with plans for a 100-ton cyanide plant to treat ores from their mines at Thomasville, N. C.

J. W. LYONS has resigned as manager of the power department of the Allis-Chalmers Co. to take the position of consulting engineer to the Elgin Watch Co. of Elgin, Ill. Mr. Lyons takes with him the good wishes of all his former associates in the Allis-Chalmers Co.

E. H. BENJAMIN, secretary of the California Miners' Association, has been appointed on the International Jury of Awards at the St. Louis Exposition. The appointment carries all expenses and \$7 per day from Sept. 1. Should his private business permit, Mr. Benjamin may attend as a public duty.

Commercial Paragraphs.

THE Brown Corliss Engine Co., of Corliss, Wis., has a contract for four large vertical cross compound Corliss engines, to be direct connected to generators, for the Washington navy yard—an important installation.

THE Redfield Drill Co. is now located at Davenport, Wash., having removed its headquarters there from Denver, Colo., but orders may still be sent as before to Jno. H. Redfield, 1606 Blake street, Denver, Colo. The company reports considerable good business.

THE Victor Metals Co., East Braintree, Mass., are now erecting a rolling mill for the manufacture of their Victor non-corrosive silver metal into sheets and rods. This mill is found necessary, as the demand for their metal is so large that other mills, now manufacturing alloys, cannot handle this metal to advantage. Catalogues of rolling mill machinery and furnaces are requested.

THE Rand Drill Co. of New York is shipping an Imperial compound compressor to be used on the extension of the Chicago drainage canal. A compressor of the same type is already in operation on this work and is furnishing compressed air for ten Little Giant drills (No. 3). The two compressors have a combined capacity of furnishing 3400 cubic feet of free air per minute.

THE S. H. Supply Co., Twenty-second and Larimer Sts., Denver, Colo., report sale of four 350 H. P. Babcock & Wilcox boilers, consisting of nine carloads, to Ashland, Ky.; 10-stamp mill complete, to Boulder, Colo.; 25-ton concentrating and crushing plant, to Chesaw, Wash.; 100-stamp mill, to California; 200-ton cyanide plant and electric lighting plant, to Laramie, Wyo.; 10-stamp mill and air compressing plant, to Russell, Colo.

THE Wellman-Seaver-Morgan Co. have cablegram advices from their branch office in London, England, that they have been awarded a contract to manufacture and erect for the Fresno Copper Co., Ltd., of England, one of the most complete copper smelting and refining plants in the country. The plant is to be located in Fresno county, California, and at present will consist of two large copper smelting furnaces with a complete equipment of hot blast stoves, blowing engines, Bessemer converting plant and stock handling equipment. The plan is expected to effect a saving in fuel and labor cost. The entire equipment making up this order will be manufactured in every detail in the works of The Wellman-Seaver-Morgan Co., located at Cleveland and Akron, Ohio. The company is able to build equipment in their own works, covering every stage of the operation from taking the ore out of the mine to putting it into completed product.

Books Received.

"Production and Use of Petroleum in California," being Bulletin No. 32, by P. W. Prutzman, issued by the California State Mining Bureau. Price 75 cents. It deals with the geology of oil occurrences, the field operations, the uses of oil as fuel and otherwise.

Under the title of "Mineral Resources of the United States for 1903," the United States Geological Survey has issued in pamphlet form the following: Production of Talc and Soapstone in 1903; Production of Asbestos in 1903; Production of Salt in 1903; and Production of Monazite and Zircon in 1903. These may be had upon application to the Director of the Survey, Washington, D. C.

Obituary.

J. A. KEATING, a pioneer mining man of Montana, died at Lenox, near Helena, Mont., on the 15th inst. Deceased was a native of Liverpool, England, born November, 1836.

R. H. GEARY, a pioneer miner of Colorado, died at Denver, Colo., on the 18th inst. Deceased crossed the plains in 1864 and engaged in mining in Colorado and New Mexico. He was associated with the late H. A. W. Tabor in the discoveries made in California gulch at Leadville. He was born in St. Lawrence county, New York, April, 1840, and was a veteran of the Civil War.

Latest Market Reports.

SAN FRANCISCO, August 26, 1904.

METALS.

SILVER.—Per oz., Troy: London, 26½d (standard ounce, 925 fine); New York, bar silver, 57½c, refined (1000 fine); San Francisco, 57½c; Mexican dollars, 47½c San Francisco, 45½c New York.

COPPER.—New York: Standard, \$12.75; Lake, 1 to 3 casks, \$12.50; Electrolytic, 1 to 3 casks, \$12.75; Casting, 1 to 3 casks, \$12.25; San Francisco: \$15.00. Mill copper plates, \$17.00; bars, 18@24c. London: £57 7s 9d spot per ton.

Copper shows little sign of important movement. Some large producers are said to be quoting Lake at \$12.62½@12.75. The metal report of Lewis & Sons, Liverpool, England, states that the total visible supply August 1, 1904, was 12,862 tons, as against 15,298 tons July 1, 1903, and 23,231 tons July 1, 1902. On July 1, 1900, it was nearly 30,000 tons, thus showing a constant falling off in visible supply on hand during the past four years. This can only be attributed to the increasing demand, with which the supply fails to keep pace. Under these conditions a higher price will eventually obtain, despite any manipulation by large producers and dealers.

Following are the figures of the German consumption of foreign copper for the months January-June, 1904, as compared with the same period of time for 1903-1902:

	1904.	1903.	1902.
Import, tons.....	56,316	43,688	41,524
Export, tons.....	4,063	5,380	4,486

Consumption, tons. 52,253 38,308 37,038

LEAD.—New York, \$4.25; Salt Lake City, \$3.50; St. Louis, \$4.12½; San Francisco, \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½c; pig, \$4.85. London: £11 13s 9d long ton.

SPELTER.—New York, \$4.95; St. Louis, \$4.75; London, £22 12s 6d long ton; San Francisco, ton lots, 6½c; 100-lb. lots, 7c.

TIN.—New York, pig, \$26.85@27.00; San Francisco, ton lots, 28c; 500 lbs., 28½c; 200 lbs., 29c; less, 29½c; bar tin, \$30@32½c. London, £122 7s 6d spot.

PLATINUM.—San Francisco, crude, \$18.50 per oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75 @ 82c per gram.

QUICKSILVER.—New York, \$42.00@44.00, large lots; London, £7 17s 6d San Francisco, local, \$41.50@43.00 per flask of 75 lbs.; Denver, \$45.00. Export, \$41.00@42.00.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 31½c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 17.75c; San Francisco, Plumbers', 100-lb. lots, 15.25c.

ZINC.—Metallic, chemically pure, ½ lb., 50c; dust, ½ lb., 10c; sulphate, ½ lb., .04c.

NICKEL.—New York, 40@47c per lb.; ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 31@34c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$12.85 @13.20; gray forge, \$12.00; San Francisco, bar, 8c per lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$23.00@23.00; open hearth billets, \$23.00 @23.00; San Francisco, bar, 7c to 12c per lb.

Turnings .....	7 00@7 50

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6½c; less than 500 lbs., per lb., 7c; in 25-lb. tin pails, ½ lb. above keg price; in 1 and 5-lb. tin cans, 100 lbs. per case, ½c. per lb. above keg price. Dry Lead.—In bbls., 1 ton and over, 6½c; do. in kegs, 7c.

LUMBER.—(Retail): Pine, ordinary sizes, \$24.00@25.00; extra sizes higher; redwood, \$28.00@30.00; lath, 4 feet, \$4.50 @5.00; pickets, \$21.00; shingles, \$2.50 for No. 1 and \$2.25 for No. 2; shakes, \$13.50 for split and \$15.00 for sawed; rustic, \$28.00 @35.00.

NAILS.—This week the basic prices are: Wire, \$2.77; Cut, \$3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, \$3.35; Cut, \$3.55; 10d to 16d, Wire, \$3.45; Cut, \$3.35; 8d Wire, \$3.50; Cut, \$3.50; 6d and 7d, Wire, \$3.60; Cut, \$3.60; 4 and 5d, Wire, \$3.70; Cut, \$3.70; 3d, Wire, \$3.85; Cut, \$3.85; 2d, Wire, \$4.10; Cut, \$4.10. Special rates for carload lots.

LIME.—Santa Cruz, \$1.25 country, \$1.25 city per bbl.

CEMENT.—Imported, \$2.15@2.65 per bbl.; California carload lots, \$2.10 f. o. b. at works; small lots, \$2.40 per bbl. in sacks, 4 sacks to bbl., 10c for each sack returned.

GENERAL SUPPLIES.

ANTIMONY.—New York, Cookson's, 7½c; Hallett's, 6½c; San Francisco, 1000-lb. lots, 8c; 300@500-lbs., 8½c; 100-lb. lots, 10½c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17c. No. 1\*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1\*\* 50%, carload lots, 11½c; less than one ton, 13c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11c. No. 2\*, 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2.00 per keg.

CAPS.—3x, \$5.50@6 per 1000; 4x, \$6.50 @7; 5x, \$8@8.50; Lion, \$9@9.50, in lots not less than 1000.

FUSE.—Triple tape, \$4.00 per 1000 feet; double tape, \$3.50; single tape, \$3.10; Hemp, \$2.75; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11½c per set; 14 oz., 40s., 10c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 23@24c per lb.; carloads, 23@23½c; in tins, 30c; soda ash, \$2.00 per 100 lbs.; hyposulphite of soda, 3@3½c per lb.; caustic soda, in drums, 3@3½c per lb.; Cal. s. soda, bbls., \$1.20@1.40 per 100 lbs.; sks., \$1.05; chloride of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2½c; powdered sulphur, 2½c; flour sulphur, French, 3½@3½c; alum, \$2.00@2.25; California refined, 1½@2c; sulphide of iron, 8c per lb.; copper sulphate, 5½@5½c; chloride of lime, spot, \$2.50@2.75; sulphuric acid, in carboys, 66% B, 1¼@2c per lb.; nitric acid, carboys, 8c per lb.

COAL.—San Francisco, coast, yard prices: Wellington, \$8.00; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallsend, \$7.50; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8.00; Cumberland, \$13.00; Cannel, \$8.50; Welsh Anthracite, \$13.00; Rook Springs, \$8.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13.00 in sacks; Sunnyside, \$8.50, long ton.

OILS.—Linseed, boiled, bbl., 57c; cs., 62c; raw, bbl., 55c; cs., 60c; Lucol oil boiled, bbl., 50c; cs., 55c; raw, bbl., 48c; cs., 53c. Kerosene—Pearl, per gal., 19½c; Astral, 19½c; Star, 19½c; Extra Star, 24c; Eocene, 23c; Elaine, 26c; Water White, in bulk, 13c; Mineral Seal, iron bbls., 18c; wooden bbls., 20c; cs., 24c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22½c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 13c; do., in cs., 19c; Lard Oil, E. W. S. bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Sperm, crude, 63@68c; Natural White, 63c; Bleached, do., 57c; Whale Oil, cs., 52@57c.

ALUMINUM.—No. 1, 99%, small lots, 37c per lb.; 100 lbs., 35c; 1000 lbs., 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

BORAX.—Concentrated, 6@7c per lb.; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

BONE ASH.—Extra No. 1, 5@6c per lb., No. 1, 4@5c.

RED LEAD.—500 lbs. and over at one purchase, ½ lb., 7c; less than 500 lbs., 7½c.

LITHARGE.—Pure, in 25-lb. bags, 8@9c per lb.

MOLYBDENUM.—Best, \$2.00 per lb.

CHROMIUM.—90% and over, ½ lb., 80c.

PHOSPHORUS.—American, ½ lb., 70c.

SILVER.—Chloride, per oz., 90c@1.00; nitrate, 55c.

MERCURY.—Bichloride, ½ lb., 77c.

MAGNESIUM.—Pure, N. Y., 60c.

MANGANESE.—½ lb., \$2.75.

SODIUM.—Metal, ½ lb., 50c.

BISMUTH.—Subnitrate, ½ lb., \$2.10.

URANIUM.—Oxide, ½ lb., \$3.50.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

## New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR WEEK ENDING AUGUST 16, 1904.

767,792.—CLOTHESPIN—H. S. Broughton, Salem, Or.  
767,626.—CIGARETTE MAKING DEVICE—A. E. Buckingham, Oakland, Cal.  
767,386.—POTATO SLICER—C. Canciani, Sonora, Cal.  
767,926.—CONCENTRATOR—C. A. Christensen, Orestown, Or.  
767,544.—BRIQUET MACHINE—J. J. Crawford, S. F.  
767,634.—CROSSCUT SAW—D. E. Crouch, Tollhouse, Cal.  
767,685.—WELL DRILL—A. F. Darling, S. F.  
767,546.—RAIL JOINT—J. T. Davis, S. F.  
767,397.—SAWING MACHINE—O. W. Fairfield, S. F.  
767,403.—WRENCH—Glover & Hulbert, Santa Rosa, Cal.  
767,562.—WINDMILL REGULATOR—A. R. Hoesly, Martinez, Cal.  
767,890.—HARROW—G. W. Hoyle, Cloverdale, Cal.  
767,893.—ROSE COUPLING—W. S. Jewell, Oakland, Cal.  
767,586.—FIRE ENGINE HEATER—J. C. Mattheis, Alameda, Cal.  
767,824.—CONVEYOR—W. J. McCabe, Seattle, Wash.  
767,911.—SWIVEL TRUCK—W. J. McCabe, Seattle, Wash.  
767,835.—GEAR WHEEL—M. McIntyre, Canyonville, Or.  
767,908.—KITCHEN CABINET—F. Miller, S. F.  
767,592.—MACHINE TOOL STOP—J. B. Orbison, S. F.  
767,526.—CYLINDER REDUCER—J. N. Paulson, Seattle, Wash.  
767,527.—CYLINDER REDUCER—J. N. Paulson, Seattle, Wash.  
767,443.—WELL—M. D. Rochford, Los Angeles, Cal.  
767,601.—OIL BURNER—A. J. Smithson, Portland, Or.  
767,919.—BEET PLOW—H. F. Thompson, Springfield, Cal.  
767,610.—TICKET DISTRIBUTOR—C. H. Townsend, Berkeley, Cal.  
767,616.—BELT SHIFTING DEVICE—J. Weichhart, S. F.  
767,619.—CUSPIDOR LIFTER—J. M. Whitney, Sonoma, Cal.  
767,464.—GAS VALVE—G. Wilson, Los Angeles, Cal.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CIGARETTE MAKING DEVICE.—No. 767,626. Aug. 16, 1904. A. E. Buckingham, Oakland, Cal. Assigned to Melville Hart, of San Francisco, Cal. This invention relates to a device which is designed as a magazine for containing tobacco, papers for the manufacture of cigarettes, also matches, and a former, with means for attaching it to the tobacco-containing magazine, said former serving

to receive the paper, which is wrapped around it to form the cylinder, and after this has been done the tobacco from the magazine is delivered directly into the interior of the former. The end of the paper cylinder being then closed, by means of a plunger the tobacco is forced out of the cylinder into the paper envelope, which is simultaneously forced off the former and may then be closed to complete the cigarette. By means of this device cigarettes can always be made of the same size and length; also it is designed to form a convenient receptacle in which the tobacco, the sheets of paper for the cigarettes, the forming apparatus and matches can all be conveniently carried in a single receptacle.

CROSSCUT SAWING MACHINE.—No. 767,634. Aug. 16, 1904. D. E. Crouch, Tollhouse, Cal. This device consists in mounting a saw of any suitable or desired length in a traveler which is movable between horizontally disposed guides and connecting the traveler with a chain which is movable about sprocket wheels fixed at any desired distance apart to provide the required length of stroke of the saw. A vertical guide is disposed upon the traveler having a length equal to the distance between the two parts of the chain, and a roller travels in this vertical guide, the shaft of said roller being connected with the chain, so that power being transmitted to drive the chain, the traveler and the saw will be moved any required distance, depending upon the distance between the sprocket wheels over which the chain passes.

TICKET DISTRIBUTOR.—No. 767,610. Aug. 16, 1904. C. H. Townsend, Berkeley, Cal. This invention relates to an apparatus designed to distribute tickets and the like, and it consists of a holder within which a continuous line of separable tickets is contained and a means by which said tickets can be drawn out and separately distributed. It is especially useful in all places where it is desirable to know the order of arrival of customers or patrons and provides such patron with a ticket of identification.

HEATER FOR STEAM FIRE ENGINE.—No. 767,586. Aug. 16, 1904. J. G. Mattheis, Alameda, Cal. This invention consists of a supplemental water heater compartment carried upon the engine frame, having connections with the main boiler and a stationary exterior burner, into relation with which the portable machine is brought, and means for automatically shutting off the flame of the burner when the apparatus leaves its position with relation thereto.

BELT SHIFTING DEVICE.—No. 767,616. Aug. 16, 1904. J. Weichhart, San Francisco, Cal. This invention consists in a belt-shifter, the combination with fast and loose pulleys, of belt-shifting means comprising a support and a bar fixed thereto, a box adjustably mounted on the end of said bar, said box provided with a bracket, guide pulleys journaled in the bracket, a bar disposed at right angles to the first named bar and passing through said hanger, collars adjustably fixed to opposite ends of the second named bar, a bracket adjustably fixed to the end of said second bar, and provided with a roller, and ropes passing around the guide pulleys and connected to said collars, one of said ropes provided with a weight whereby the shifting rod is normally projected across the belt away from the loose pulley and clear of the belt.

## Mines of the Rand.

Among the most noted gold fields of the world are those of the Witwatersrand, in the Transvaal, South Africa. The center of the mining industry is Johannesburg, a city of upward of 75,000 inhabitants (see accompanying illustration). The discovery of these famous gold deposits was due indirectly to the discovery and development of the diamond fields in the Kimberly region, several hundred miles southwesterly

reefs, and one of them was traced without much difficulty for several miles by its repeated outcrop along the surface. The first reef to be developed was called the Confidence, but it proved pockety and unsatisfactory, and the returns in a mill built to crush the ore were insufficient to make it a paying proposition. The owners of the Confidence expended over \$50,000 in the equipment and development of their property, but, meeting with such indifferent success, were about to abandon it, when, in 1886, a

the mines of that district just prior to the outbreak of the Boer war was nearly \$100,000,000 annually. Since the close of the war—during which only a few mines were operated—the output has slowly increased, until it has now reached a monthly production approaching \$6,000,000. Three of the engravings herewith show the types of head frames constructed at the inclined shafts. Those built later over the vertical, deep shafts are of somewhat different type; and those now in use at vertical shafts of 3000 and

The Market Place, Johannesburg, S. A.

from Johannesburg. From that center prospectors and adventurers scattered over thousands of square miles of South African territory, and one excitement followed another in rapid succession. The discoveries were generally reported to be far richer and more extensive than they really were, but these reports served to keep interest alive and there was no cessation to prospecting merely because a new field proved to be less profitable than had been anticipated or reported. In 1882 rich discoveries were made about 250 miles east of Johannesburg, and the district of Barberton was boomed in a manner calculated to put a decided check upon legitimate mining in new districts in South Africa. About this time gold was discovered on the Rand, the first discoveries being of placer gold in the little gullies cutting the sandstones and conglomerate beds of the region. In 1883-84 gold was discovered in the veins, and conglomerate

man in their employ found the conglomerate reef, now known as the Main reef leader. One of the accompanying engravings is that of the head frame built on the Robinson mine in its early history, and another is a view of the great tailings wheel, a device often necessary on a flat country like the Rand. Even after the discovery of rich ore on the Rand the pathway to success was not smooth. Difficulty was found in working the ore, and for two or three years the industry made slow headway. The gold was found to be very fine and difficult to save by the usual methods of gold milling. About this time experiments were being made with the cyanide process of extracting gold from ores. It was tried on the ores of the Rand, and found to work more satisfactorily than on any material previously submitted to the process. From the date of that discovery the mining industry of the Rand grew rapidly. The output of

4000 feet depth may be modified somewhat when built over shafts calculated to descend to 6000 or 8000 feet—for such shafts have come to be recognized as a probable necessity of the near future on the Rand, and the engineering problems connected with such undertakings are not regarded with greater concern than was felt over the equipment of shafts intended to sink to 4000 feet a few years since. The past two or three years—in fact, since the end of the war—the all-absorbing problem on the Rand has been the securing of a sufficient number of unskilled laborers to do the necessary work in the mines. The South African natives (Kaffirs), who in former years did this work, can no longer be obtained in sufficient numbers for the purpose, and as a last resort the mine managers have turned to China as the only available source of supply and thousands of coolies are being taken to the Rand.

FROM Salt Lake City, Utah, comes an allegation that a "business arrangement" or "alliance" has been effected between the Selby Smelting & Lead Co. of San Francisco and the American Smelting & Refining Co. Investigation discloses the fact that the assertion is but one of similar tenor made heretofore, and is entirely without foundation. The manager of the Selby Smelting & Lead Co. in San Francisco and the manager of the American Smelting & Refining Co. at Salt Lake City both say that "there is nothing in the story."

ONE of the most interesting of the numerous annual reports of the operations of corporate mining companies is that of the Con. Mercur Gold Mines Co. of Mercur, Utah, issued August 1. The report appears in the usual form, giving a financial statement of operations at that property. It shows that the gross value of ore treated was \$3.89 per ton and that the recovery averaged \$2.86, leaving an average value in the tailings of \$1.03. The amount of ore treated was 226,701 tons, which is stated to be the smallest amount ever produced and treated in one year since the organization of the company. This was accomplished at a cost of \$1.40 for mining and \$1.60 for milling, making the total cost for every expense, except construction, \$3 per ton, or 14 cents per ton over the total average amount recovered. The report shows that the costs of mining and treatment have been reduced to a figure favorably comparable with those in more favored localities. The variations in the ore at the Mercur mines has made the metallurgical problem one of unusual difficulties, and has necessitated frequent changes in the past. At present, however, the recovery is high, and it is thought it can be maintained.

## The Mining Law.

It has been suggested that a great improvement might be made in the existing Federal mining law if the prospector were not required to find "mineral-bearing rock in place" before locating his claim, and that he be given ninety days in which to decide upon the dips, strike, etc., of his vein after finding it, before proceeding to locate permanently—defining his boundaries in the usual manner. Without doubt the clause of the law requiring the discovery of "mineral-bearing rock in place" is a serious handicap upon the bona fide locator, and a change in this feature of the law might be made to advantage, but the suggestion that he be given ninety days within which to decide how he will locate his claim is an impossibility in any place other than a new and isolated district, and where no other prospectors are in the neighborhood.

Anybody who has been in a stampede mining camp can appreciate this. Where there are hundreds of men, each eager to find a mineral deposit which may make him a fortune, there are no ninety-day periods possible within which to decide upon how a location shall be made. Indeed, the locator has enough to do to locate as quickly as possible, and must then exercise vigilance to preserve and defend his location against the encroachment of others not less eager than himself. A single glance at a claim map of a rich mineral district like Cripple Creek, Creede, Leadville, Butte, or any other of a score of rich camps, will show the inadvisability of attempting to amend the law in this respect. If changes are to be made in the mining laws they should be of such a character as will simplify and not increase the difficulties of obtaining those rights which the Federal statutes are supposed to grant.

There has been a great deal said about the relation of location monuments to the position of the claim on the ground, and this has resulted in an understanding, which is backed by legislation and Supreme Court decisions, that the monuments control, but when there is a dispute the locator is usually at fault. Considering the loose manner in which many prospectors locate their claims, it is surprising that there is not more trouble over the position of claims than there is. The law is plain enough, but the prospector often neglects its simplest requirements, one of which is "The location must be distinctly marked on the ground so that its boundaries can be readily traced." The prospector often neglects to thoroughly and plainly mark the boundaries of his claim, contenting himself with a location stake, a monument or two, or blazed trees, and makes no serious endeavor, as a rule, to comply with the letter and spirit of the law to so mark his location that "its boundaries may be readily traced." If this be done, and witnesses secured to the marking and the notice of location recorded and assessment work performed, there will be little, if any, litigation over title.

THE reports of phenomenal strikes of gold in the new Goldfield district of southern Nevada, whether accurate or otherwise, will have the effect of greatly augmenting the population of that section. In their eager desire to secure a fortune in a day, as it were, hundreds will rush to the newest El Dorado, arriving only to find that the country is staked for miles in every direction in the neighborhood of the new camp; but the stampede cannot fail to produce beneficial results, as there are many other hills in the southern end of that State which have been but slightly prospected, or not at all, and the probable result will be other new and valuable discoveries. It is an important fact that almost every hill and range rising out of the sagebrush-covered wastes of the great basin contain mineral deposits, which have a greater or less value, according to their situation as regards water and transportation facilities. Railroads are building through that region and water is being found by shaft sinking. These two important factors being supplied, the remainder is comparatively easy of accomplishment, for where the railroads go fuel and supplies may be taken readily and ore may be shipped out, though freight charges are high. However, the ores recently developed in that region seem to indicate that they will stand a heavy charge for transportation and reduction, and leave a substantial profit besides.

## Location by Agent.

There are many things in the mining law which undoubtedly could be changed to advantage; but it is often difficult to anticipate the effect of any proposed change. One of the proposals in this direction, which appeared in the form of a resolution presented at the American Mining Congress held last week at Portland, Or., was to the effect that location by power of attorney of claims in Alaska be limited to two claims in a district. Undoubtedly the privilege is abused, for thousands of claims are located by agents who have not even a power of attorney—which is not really necessary anyway—and these claims are held for speculation in the names of non-residents, who never saw them and who probably never will. Under the mining laws the locator is required to do nothing during the period between the date of location and the first of the following January, and he may then delay the performance of assessment work until the latter part of the second year. By taking advantage of the law, locator agents may hold a large number of claims for nearly two years, performing no work whatsoever on these claims, which are taken for speculative purposes only. The purpose of the law is to foster and promote the mining industry and to secure the development of the mineral lands of the United States territory, while protecting the claim holder in his possession of the claims. Looking at it broadly, it seems to matter little whether the lands are held by a large number of individuals or by a smaller number who control large holdings, so long as the law is complied with; but in many instances neither the individual holder of a large number of claims nor the wealthy corporate owner of an equal number of claims actually complies with the law—the one from inability, the other from disinclination. The United States statutes fix the minimum of requirement, and the several States and Territories may add additional requirements as a part of the act of location—such, for instance, as the performance of a certain amount of work within stipulated time, as ninety days in Arizona. Alaska is not a Territory and has no Legislature, and therefore legislation of this character can not be enacted within that district; but Congress may make laws controlling the disposal of Alaska's mineral lands, and the wholesale taking of claims by agents who perform no work is a matters deserving of congressional attention.

IT has been planned to have an exposition of mining and hydraulic machinery at Barcelona, Spain, this year, but, strange to say, American manufacturers, it is reported, have made no application for space, though German and English founders and manufacturers are in the field. American manufacturers are usually so alert to these opportunities, and enter into such keen competition with foreign markets and with each other, that the lack of American interest in this Spanish exposition, held in a country where mining is one of the chief industries, is the more remarkable. Spain has large developed and undeveloped mineral resources, but methods in many instances are primitive. There are said to be great latent, undeveloped water powers, dredging possibilities, mining and metallurgical opportunities in Spain, of which American machinery manufacturers should inform themselves. It is stated that all exhibits will be admitted free of duty and reduced railroad charges will be made.

THE death by premature explosion of several miners engaged in sinking the shaft of the Argonaut mine near Jackson, Cal., again emphasizes the necessity for carefully testing the fuse used in blasting operations. It is said that in this instance the fuse was of a make unfamiliar to the men, who, supposing it to be similar to ordinary fuse, prepared their blasts, spit them and turned to take the skip to ascend to a point of safety, but the blasts exploded before they could leave the bottom of the shaft. Defective fuse is one of the most dangerous elements in mining. Whether it be too fast or too slow, it matters little. There are many more accidents from slow fuses, which cause men to return to a delayed blast, than those which burn so rapidly as to allow insufficient time for escape. Between the two, undoubtedly, the latter is the more dangerous. It shows the necessity of carefully testing new invoices of fuse, whether of a kind previously in use or a new and untried brand.

## CONCENTRATES.

SEVERAL questions stand over to be answered in the issue of next week.

If a cubic foot of the alloy weighs 678 pounds, its specific gravity is 10.848.

STEEL HOISTING ROPES having hemp centers weigh about two pounds per foot for each square inch of cross section.

A GEAR whose pitch is 2½ inches, pitch diameter 44.66 inches, and which makes 80 revolutions per minute, will safely transmit 42.24 H. P.

INFUSORIAL EARTH is used as a fine abrasive and is sold under the name tripoli. There are numerous deposits of this material in the United States.

ARTIFICIAL cinnabar can be produced by the action of a superheated solution of alkaline sulphide on the black amorphous sulphide of mercury.

A TIMBER FLUME 10 feet wide and running 5 feet deep, with an inclination of 9 inches to the mile, would, theoretically, discharge 114.5 cubic feet per second.

A SHAFT sunk 1000 feet at an angle of 75° from the vertical will depart from a vertical line 258.8 feet. The shaft at the 1000-foot point will be 965.9 feet vertically below the collar.

THE compartments of a shaft through which men are hoisted are usually lined, as a means of securing greater safety. One inch boards are considered sufficiently heavy for this purpose.

If the 24-inch pipe discharges 2 cubic feet per second, under the same circumstances a 28-inch pipe would discharge 3 cubic feet per second. It would take sixteen 8-inch pipes to discharge as much as the one 24-inch pipe.

THE distance between supports on aerial tramways varies greatly with the contour of the ground. On level country it is usually 250 to 300 feet, but in hilly or mountainous regions it may be less and is often very much more.

AMONG the placer miners of southern Mexico the adarme is used as the standard of value. There are sixteen adarmes to the ounce, and gold buyers in the vicinity of the placers pay \$2, Mexican, per adarme for gold dust.

A HEMP ROPE is not exactly round, and the proportion of the diameter to the circumference (3.1416), does not hold good. For a three-strand rope the circumference would be about 2.86 times the diameter; for a seven-strand, about 3.

IN sending questions for answer in "Concentrates" it is essential that all the facts be given, and that all the factors entering into the solution of the question be correctly furnished. Otherwise it is impossible to give accurate or satisfactory answer.

ONE advantage of patenting a mining claim is that it secures the owner in his title, and there is no further necessity for assessment work nor danger of encroachment by others. Both patented and unpatented claims are subject to taxation.

THE maximum working load in pounds that may be allowed on a wire rope equals the square of the circumference of the rope in inches, multiplied by 600. Hence a wire rope 4 inches in circumference should not have a load to exceed 9600 pounds.

A CHURN DRILL for deep holes—18 to 20 feet—may be made of a length of 1½-inch pipe to the end of which is welded a few feet of drill steel, provided with a suitable bit. In rock of ordinary character two men can cut 10 to 20 feet in a shift with this drill.

AT sea level the rending force of black powder is calculated at thirty tons per square inch. Black powder is deemed better for coal mining than dynamite, the former breaking it into convenient shape, the latter tending to waste by shattering it into dust.

THE value of asbestos produced in the United States in 1902 was \$16,200. In 1903 it was \$16,700, though the quantity (887 tons) was much less than during 1902, when it was 1005 tons. During 1903 Canada produced 22,328 tons of asbestos, valued at \$904,852.

THE only "sulphate of copper mine" known to "Concentrates" is the Copacquire deposit near Huatacondo, Province of Tarapaca, Chile, S. A., a rainless region. It is reported to average 2% metallic copper and is being worked by the Copacquire Copper Sulphate Co. of London, England.

SOME of the States have statutes requiring any one operating a stationary steam engine to have a license,

duly issued by a board of inspectors. The suggestion that every mine hoisting engineer should have a license is one that has been urged upon the attention of the Federal government.

THERE has been an attempt to recover lead from roasted ores by the use of hydrochloric acid, the lead to be precipitated by metallic zinc, the zinc remaining in the solution to be thrown down by lime, but while theoretically exact, the method does not appear to be satisfactory in a practical way.

WHERE a flume has dried out and become useless by shrinkage of the boards, it is cheaper to remove the boards and rebuild the box by tearing off the boards and turning them. New battens are usually necessary and many leaks will at first occur, but these will diminish as the water continues to flow through the flume.

BRIQUETTING fine ores for smelting has aided in the successful solution of that problem, and another plan has met with fair results wherein what may be styled "metallic coke" is produced. Coal dust, fine iron ore, and the requisite amount of flux thus produces in the coking oven a metallic sponge for the blast furnace.

ZINC SHAVINGS used in the precipitation of gold from cyanide solutions will weigh about 6.5 to 7 pounds per cubic foot when well packed. It has been found advantageous to pack the precipitation boxes closely and firmly, as this offers a greater surface of zinc to the passing solutions than where they are loosely packed.

THE practice of mixing rich ore with that which is too poor to pay is a bad one, though of frequent occurrence. Where the ore is treated at a custom mill at a stated price per ton, this is sometimes done to the advantage of the millman, but at a loss to everyone else concerned, and when this is done some one is at fault at the mine.

A NARROW MORTAR with low discharge is not suited to amalgamation in the battery where it is not easily and quickly accomplished. Amalgamation in the mortar has a tendency to flour mercury. Cyanide men do not agree upon the advantage or disadvantage of having mercury in the tailings to be treated by cyanide process.

SHALES are less important as carriers of oil and gas than either conglomerates, sandstones or limestones. The occurrence of oil of great commercial importance is always in a rock or bed of loose porous material. Shale and other fine-grained rocks are too dense to afford room for large amounts of oil to occur in the interstitial spaces.

CONSIDERABLE silver, lead and gold mining has been carried on in the Argentine Republic, S. A., mostly by English companies, with unsatisfactory result. It would be folly for an American miner to go to that country in search of work, or under other conditions than at an assured salary for a definite period from a responsible company.

AMAZONSTONE is a variety of potash feldspar (microcline). It occurs of light bluish-green color and is found in several localities, notably in the granite of Pike's Peak, Colo., and in the Ural mountains. It is like orthoclase in composition, containing 64.7% silica, 18.4% alumina and 19.6% potash. Soda is also usually present in small amount.

IMPERFECT WATER JACKETS on blast furnaces are an element of great danger, as in the event of a leak appearing on the inner sheet of the jacket a large volume of steam is suddenly generated which is likely to cause an explosion. An accident of this nature occurred a short time since in one of the furnaces of the Old Dominion Co. at Globe, Ariz.

A NATIONAL BUREAU OF STANDARDS was organized by the United States Government nearly four years ago, and while it has not yet got to testing the accuracy or setting the standard for instruments used in mines or by mining engineers, its progress in standard tests for the U. S. Geologic Survey and Coast and Geodetic Survey indicates reasonable belief in the ultimate standardization of mining instruments.

THERE are ore deposits on Cedros island, off the coast of Lower California, of considerable extent. These ores contain gold, silver, copper, zinc, iron, sulphur, arsenic, antimony and other bases, beside in places masses of native sulphur. Specimens of native sulphur have been found in these mines which contain gold, it is said, to the amount of \$100 per ton. The ores occur mostly in diorite and other dark, basic rocks.

HEATING the feed water of a boiler will save from 25% to 30% of the fuel. A good heater may be made which will utilize the exhaust of the engine, which will raise the feed water almost to the boiling point. Exhaust steam may also be used to advantage in the change and drying room of the mine in drying ore and concentrates, and in various other ways where an economical means of utilizing waste heat is desired.

A NO. 7 NEEDLE-SLOT punched screen is equivalent to a 30-mesh (900 holes to the square inch) woven wire screen. The width of the slot is 0.024 inch. The slots in screens of this kind are made ⅓ of an inch long.

Screens are made for laboratory use as fine as 200 holes per linear inch (40,000 holes per square inch). They are used in making tests of slimes and ores in which the precious metals are finely disseminated.

DIKE ROCKS frequently carry payable gold ores, both free and in the various combinations of sulphur, arsenic, tellurium, etc. Silica in free state (quartz) is not always in evidence. Rocks should not be condemned merely because they do not carry free quartz. If panning after crushing does not show gold, assaying should be resorted to. Often the fine alluvial below a gold-bearing vein will prospect in gold, thus affording an indication of its character, when no gold is seen in the rock itself.

THE principal advantages of hoisting by stages from great depth, in having the hoisting plant at the surface, is in that a reel or winding drum of much smaller size is possible, than if all the rope were wound on one reel, the lift being made in a single stage. Another advantage is in not being obliged to place the heavy machinery required under ground, which in itself is an item of great expense, as the machinery must be made in sections, and a large station cut out for its reception underground.

PYRRHOTITE often contains nickel, sometimes in paying quantities. There is no quick "wet" method of making nickel determinations, as all of the processes involve both dry and wet methods, and all are elaborate and complicated. When nickel-bearing ores—which usually also contain cobalt—are oxidized, the green color of the nickel silicate, and often the pink color of the nickel arsenate, erythrite (cobalt bloom), may be seen. If, upon heating, the odor characteristic of arsenical fumes are given off, nickel and cobalt may be suspected.

THE result of fusion of the sulphide ores of copper in either stacks or reverberatories is essentially the same. In either case the operation results in producing two distinct products. First, slag, which contains mainly the earthy portions of the ore and such iron as may be present in the form of oxide; second, matte, composed of copper and sulphur, in the form of sub-sulphide of copper, with such amount of sulphides as can be formed from the surplus sulphur that remains after all the copper has been satisfied. The matte also contains any gold and silver that may have been present in the original ore. These latter are of no consequence from a chemical point of view in the operation of the furnace, though they may be of great importance from the commercial standpoint.

REGARDING the Beaumont and Sour Lake oil fields of Texas, in the former the oil-bearing territory is about 250 acres in extent. The oil-bearing rock is porous dolomite, which occurs as a dome shaped mass at a depth of 800 feet, at the point of its greatest elevation, near the center of the field, from which it dips away in all directions. As the edge of the oil field is approached the dip increases to nearly 60°. At this place the oil rock has been proven to be over 1000 feet thick (due to the dip, in part). Beyond the dip again flattens, and as far as the territory has been proven by borings the oil ceases. The formation (dolomite) is 70 feet in thickness, and is defined by an area of less than 300 acres. At Sour Lake, 20 miles west of Beaumont, the geological structure is similar, but the oil-bearing stratum is loose sand. In one portion of this field the sand is partly cemented by dolomite. The temperature of the oil from this field is as high as 104° F. In both the Beaumont and Sour Lake fields rock salt underlies the oil-bearing formation, and in some of the oil fields of that region oil occurs in the rock salt, and in a layer of clay above the salt are found galena and zincblende. Other accompaniments of these oil occurrences are gypsum, sulphur, hot sulphurous waters and hydrogen sulphide.

IN Mexico iron is found in commercial quantities in the States of Durango, Jalisco, Michoacan and Guerrero. The Cerro del Mercado, situated immediately north of the City of Durango, probably contains one of the largest bodies of iron ore in the world. Humboldt estimated the value of this immense deposit at over nine billions of pesos, silver value. This is over ten times the present property valuation of the City of Mexico, and nearly three times the value of the silver coinage of Mexico for the last 350 years. North of Tapalpa and east of the copper zone, ranging northeast by southwest in the State of Jalisco, are large bodies of iron which are worked by Americans and treated at the iron plant at Tule. In the southern part of Jalisco, at Pihuamo, are also large iron ledges which are being worked. These ledges carry small gold values, but not enough to affect the market price of the ore. Near the Michoacan and Guerrero boundary line is an extensive iron belt running southeast by northwest in which iron bodies outcrop on all the mountain spurs running toward the coast. Nearly all the ore in this belt contains a small percentage of copper, while to the south running parallel is an extensive zone of gold placers. Near the Rio Balsas are large deposits of iron which are soon to be exploited with American capital. All the iron belts of Michoacan merge into copper as they approach the Rio Tepalcatepec. In Guerrero, south of the Rio Balsas, are situated the iron interests of the Standard Oil Co., which rival in size and value the Cerro del Mercado. The States of Sinaloa, Chihuahua and Oaxaca and the Territory of Tepic also contain large iron deposits.

## Some St. Louis Exhibitors.

[FROM OUR WORLD'S FAIR CORRESPONDENT.]

So much has already been sent you illustrating and describing exhibits of manufacturers and display of products, that it may seem like piling it on to send any more concerning that great feature of the Exposition, but the extent and importance of those exhibits certainly justifies further mention.

The palace of mines and metallurgy, in which are installed mineral products, the machinery for mining and the equipment for utilizing the same, together with the resultant metals and other products, occupies the southeastern corner of the fan-like spread of the leading exhibit palaces, its main entrance being directly opposite the palace of liberal arts.

The interior is treated with screen effect, the base of the screen consisting of dividing columns separating panels which illustrate the history and operations of mining and metallurgy. Two of the main entrances are signalized each by a pair of obelisks and fine statuary ornamentation. The building occupies an area of nine acres, being 525 feet wide and 750 feet long, and was erected at a cost of \$500,000. It is well lighted. Within this building and in the adjacent outdoor mining reservation are displayed the mineral products of the world, together with illustrations of mining and metallurgical processes. The leading metallic ores, iron, lead, zinc, gold, silver, etc., are mainly illustrated by examples from the several States and foreign collective exhibits. These are supplemented by metallurgical exhibits and coal displays made by private individuals and corporations.

In the gulch such exhibits as operating oil wells; gold, silver and lead mills and furnaces, aerial tramways, coal-testing equipment, mining railways, etc., are fully displayed in actual size and under the customary methods of operation. Especial attention is given to the new and rarer minerals and processes for their reduction, and rare stones and crystals are exploited at their best, and the methods of cutting and setting them are illustrated by an operating lapidary establishment. Clay and its products have been given a prominent position, and here are found not only the raw material, but the most finished and modern ceramic art products, together with an operating pottery.

The palace of mines and metallurgy and its adjacent areas contain all that is new or interesting in the special field allotted to it.

In the mining gulch are now being completed two exhibits, the coal-testing plant of the United States geological survey and the timber-preserving plant of the bureau of forestry.

The mining gulch entrance is diagonally opposite the southeast corner of the mines and metallurgy building. The Government coal-testing and timber-preserving plants stand along the railroad tracks which run up the gulch and are near the entrance.

The work of the coal-testing plant will be the determination of the respective fuel values of every grade of coal which may be submitted. A 250 H. P. horizontal Allis-Chalmers engine in this plant will supply power for the various mechanical operations to which the samples of coal will be subjected, and serve to give practical tests through its power-producing qualities of the actual values of the various coals. The samples of coal will be analyzed, burnt under boilers under varied conditions, coked and used for gas producing. Their values for gas production and the power qualities of the gases will be tested in a gas engine.

Records of every test will be kept, and it is believed that before the fair is over data will have been secured which may result in the early development of several new coal fields in the country.

The timber-preserving plant, which stands about 100 yards farther up the gulch, is under the direction of H. Van Schrenk. Its special work will be to test all the various methods offered for preserving railroad ties. For this purpose the Allis-Chalmers Co. has lent, free of charge, a tie-treating retort and two tanks for the preservative solutions. Practically all the methods which are now in use for preserving railroad ties and other timber from rotting when exposed to earth and weather are alike in the treatment and differ only in the preservatives employed.

The system supplied consists in placing the ties in the retort, where the first operation is to dry out all of the water and sap by heat, and exhaust all of this and the greater part of the air from the retort proper by pumps. Then while the pores of the wood are all open and practically free from vapor, moisture or air the preservative mixture is let into the retort from the tanks. The preservatives are thus, under the influence of the vacuum in the pores of the wood, carried into every part of the timber. At the plant in the gulch it is intended to treat various lots of ties by different processes. Each batch of ties will then be put into regular service in some railroad track and a record kept of each tie until it is worn out or rotted out. As these tests and records will be official, they will carry great weight.

In the mining gulch the Star Drilling Machine Co.

of Akron, O., show the following machines: No. 7 drilling machine, capacity 2500 feet; No. 0 water well machine; traction prospecting machine; 20 H. P. oil country boiler. Also a full equipment of drilling tools. In charge of O. E. Peppard.

The Keystone Driller Co. of Beaver Falls, Pa., also have a fine exhibit in the mining gulch. They are drilling a well with one of their machines at their exhibit, and are now down over 210 feet, through formations of clay, sand, shale and St. Louis limestone. Other types of their machines are shown. In connection with this exhibit, the J. L. Downie Pump Co., Downieville, Pa., show types of their double-acting deep-well geared pump, as well as single acting. They can be driven off line shaft, or by motors, belted or direct connected.

The Keystone driller is in widespread use for testing gold placer ground; about forty huge gold dredgers, costing from \$35,000 to \$50,000 each, have been put in in various gold-dredging ground in Montana, Colorado and California on results secured by tests made by the Keystone driller. E. O. Eyer has charge of the exhibit.

The performance of 54,000 horses represents the power required for lighting, pumping, and for operating concessions and exhibits in the Exposition. This mammoth power plant occupies practically all the western half of the palace of machinery, a space about 600 feet long by 300 feet wide. Installed here are engines and generators representing the best type of prime movers from the greatest works of this country, England, France and Germany. The steam for the operation of these engines is generated in the steam, gas and fuels building, a fire-proof structure 330 feet long by 300 feet wide, about 100 feet distant from the palace of machinery. The pipe lines, conveying the steam from the boilers to the engines and returning the condensed water back to the boilers from the condensers, fill a tunnel 7 feet broad and 8 feet deep.

The eastern end of the palace of machinery is occupied by exhibits of machine tools and wood-working machinery and all the accessories needed in a complete power plant and a machine shop. The scope of the exhibits in machine tools covers the entire field, from the small machines for working out the tiny screws, bolts and gears of a watch to the huge lathes for turning the shafting for an ocean steamship or the big guns of a man-of-war. In the wood-working line there are machines that do the most delicate grill work, and on up to the great mechanisms contrived to turn the giant trees of the forest into lumber for the world's markets. One especially interesting machine is the immense hydraulic press from the Krupp Works, Germany, used for embossing metals.

The department of machinery furnishes as an exhibit the three massive pumps that deliver 90,000 gallons of water per minute to flow over the cascades. This building is an exposition in itself, and deserves more extended notice, in which every reader of the MINING AND SCIENTIFIC PRESS who visits the fair will heartily agree.

The Lunkenheimer Co. have an exhibit in Block 26, Machinery Hall. A full illustrated description of their exhibit was given in your columns of the issue of July 23d. The exhibit is in charge of E. G. Greenman. The pyramids of their various makes of valves are a noticeable feature of the Lunkenheimer Co.'s exhibit. These include regrinding globe, angle, cross and check valves in the smaller sizes, and iron body globe and gate valves up to 15 inches. They also exhibit a line of plain, chime and fire alarm whistles, blow-off and pop valves, lever valves, generator valves, and a complete line of oil and grease cups and lubricators, besides single and double feed mechanical pumps. Multiple oilers, automatic injectors, cross head oilers and water columns are also shown in different forms and sizes. In all cases, where practical, sections are shown so that the interior construction may be seen at a glance.

The Jeanesville Iron Works Co. of Hazelton, Pa., make a fine showing in Block 42, Machinery Hall. They exhibit one of their triple-expansion duplex pumps having an 11-inch high pressure, 17-inch intermediate and 30-inch low pressure, with a 10-inch plunger and 36-inch stroke. It delivers water to a fine water wheel, direct connected to a 150 K. W. Crocker-Wheeler generator used in connection with the Inter-mural railroad. Other pumping machinery is also shown. A. Middlebrook is their Denver, Colo., manager.

The Robins Conveying Belt Co. of Park Row Bldg., New York City, in Block 31, Machinery Hall, exhibit one of their latest type of belt conveyors with automatic tripper for transporting ore and other materials. The conveyor is in operation, and a Richardson scale is also connected with it.

To avoid dust and dirt, small pieces of rubber are put through the machine instead of ore, etc. An exhibit is also made in the mining gulch.

The Philip Carey Mfg. Co. of Lockland, O., in Block 26, Machinery Hall, report that, aside from their regular exhibit, 526,000 square feet of their steam pipe and boiler covering have been used at the Fair. Their product is largely used by the United States Government. R. D. Gray is in charge.

The Roe-Stephens Mfg. Co. of Detroit, Mich., are in Block 26, Machinery Hall, and show a line of

valves, fittings, etc., in connection with C. W. Thomas of Detroit, in charge of A. Fitzgerald.

The Weber Gas & Gasoline Engine Co. of Kansas City, Mo., exhibit in Block 44, Machinery Hall, and have also a live exhibit in the Gas, Steam & Fuel Building.

Aside from their regular line of gas and gasoline engines, they display the Weber suction charcoal gas producer, which has lately been brought out. This machine automatically produces a combustible gas which can be piped direct to the cylinders of an internal combustion engine and used as power.

They have a complete plant in operation in the Gas, Steam & Fuel Building, consisting of a Weber two-cylinder upright gas engine, operated on charcoal-producer gas furnished by the Weber gas producer.

A number of these producers are in operation throughout the United States and Mexico. The manufacturers claim that one pound of good charcoal will furnish fuel to operate a gas engine 1 H. P. hour, and that one man can look after a plant ranging from 500 to 1000 H. P., it only being necessary to see that the producer is supplied with fuel and that the water supply is not interrupted.

The exhibit is in charge of Allen H. Allen, general manager of the company's interest in northern Mexico, who will be glad to furnish any information desired.

One of the most imposing exhibits of Machinery Hall is that of the Wm. Powell Co. of Cincinnati. In this exhibit may be found all modern mechanical brass and iron fittings for the boiler and engine room and gas-engine practice of high grade of manufacture. Signal oilers, well known to engineers world over, and North Star valves may be examined and explained at the booth. The company also make and show injectors, whistles and oiling devices of all classes and for all uses. The exhibit is illuminated by a 5-foot star, the company's trade mark. The name Wm. Powell Co. in blue lights makes a very pretty soft-blue contrast to the white and gold columns and arches.

The Murray Iron Works Co. of Burlington, Ia., are in Block 42, Machinery Hall, operating a Corliss engine of the rolling mill type, 800 H. P., 26x48 inches. This is one of the engines that runs the power plant of the Intramural railway that encircles the Exposition grounds. H. A. Hewitt is in charge.

The Brown Corliss Engine Co. of Corliss, Wis., in Block 45, Machinery Hall, have two vertical cross compound engines, each of 750 H. P., which are part of the power plant of the Intramural railroad. These are direct connected to 500 K. W. Crocker-Wheeler generators. F. A. Yard is in charge.

The Stillwell-Bierce & Smith-Vaile Co. of Dayton, O., in Block 50, Machinery Hall, make an exhibit of condensers, heaters, pumps, etc., which are in connection with the various exhibits of engines which operate the Intramural road and cascades, and also show a 7000 square foot surface condenser. F. H. Kessler is in charge.

The Lidgerwood Mfg. Co. of New York City, in Block 30, Machinery Hall, show a general line of high-grade hoisting machinery, both steam and electrically driven, for contracting, conveying, erecting and mining purposes and general railroad construction. During the year 1903 they built and sold 1805 hoists and 560 boilers, which is an indication of the merit of their product. F. E. Rainer is in charge.

The Yale & Towne Mfg. Co. of New York City, in Block 29, Machinery Hall, has the most complete exhibit of hand chain hoists at the Fair. Chain hoists are hung exactly as they are in machine shops, and range from those of a capacity of  $\frac{1}{2}$  ton to 20 tons each. It is not generally known that a chain hoist can be made by which one man can raise 20 tons by hand, and this exhibit is unusually interesting for that reason. Chain blocks, electric hoists and conveying appliances are shown. The company is well represented by F. J. Ford.

The Hercules Gas Engine Works of San Francisco, Cal., have an exhibit of their marine gasoline engines. In the gas engine section, Block 34 of the Machinery Building, that attracts attention. Their exhibit consists of five marine engines, ranging from 5 to 60 H. P., of single, double and triple cylinder, four cycle type. They are fitted with positive motion on their intake and exhaust valves, automatic throttling governors, ignition control, centrifugal circulating pumps, submerged exhausts, Hercules patent reverse gears and various ingenious devices.

The Hercules people are pioneers in the gas engine business, and their marine engines shown in this exhibit appear to be of excellent design and construction, and look as if they would substantiate their builders' claim that they are durable, reliable and especially constructed to stand long-continued hard service. Every one interested in gas engines should see this exhibit.

Noticeable also is the fine exhibit of the A. S. Cameron Steam Pump Works in Block 33, Machinery Hall. Such a showing as that made by the Cameron people impresses one with the power of inventive genius and the mechanical ability to put the ideas in practicable shape. For mines especially is noted the Cameron outside-packed plunger station pump for hard service in hard water, whether installed underground or on the surface. The gentleman in charge reports that the works were established in 1860, and of late years the export branch of the business has

grown to rival in extent the sales to domestic buyers. They supply Canada, Central and South America, Australia, South Africa, Continental Europe and the East Indies with the "Cameron" pump, there being varieties suited to every required condition. Here-with are cuts of two parts of the Cameron pump,

The Cameron Water Valve Chest.

The Cameron Steam End.

"the Cameron water valve chest" and "the Cameron steam end," which to engineers or users of steam are sufficiently clear to render unnecessary any extended explanation.

In addition to the outside-packed plunger station pump, designed where the water contains acid, or is sandy or gritty, there is also noted the "mountain

the expense of having to shovel out of cars. This arrangement also enables them to keep constantly on hand in the vicinity of the exposition grounds thirty-five cars of coal, making it unnecessary to actually carry on the grounds more than a maximum day's supply, or some 500 tons, that being the capacity of the storage pocket. The capacity of the boilers is upwards of 40,000 H. P. The boilers are arranged in four parallel rows running north and south, the size of the power house being about 300 feet square. Coal is received on two tracks, running into the building at the west end. Beneath each track is a steel hopper, 40 feet long, into which the coal is dumped. From each hopper coal is taken by a steel apron conveyor in a uniform stream to breakers placed in a pit beneath the storage pocket, the coal being reduced by these breakers to about 1 inch in size, or size suitable for the mechanical stokers and chain grates used with the boilers. Running beneath the crushers, ascending and passing over the 500-ton storage pocket, is a gravity-discharge elevator conveyor, which takes the coal as delivered by the crushers at the rate of 100 tons per hour, elevates it and deposits it into the storage pocket. Valves in the bottom of the storage pocket allow coal to flow from it onto steel apron conveyor below, which carries the coal to the south end of the building and there delivers it to a link-belt patented overlapping pivoted bucket carrier. This elevates the coal and carries it the entire length of the power house, delivering it to either one of four overhead conveyors, running above the passageways between the boiler fronts.

These conveyors over the boilers, through suitable valves, deliver the coal into five cylindrical steel tanks with conical bottoms over the boilers. From these tanks the coal passes through spouts having universal movement to the mechanical stokers.

The daily consumption is estimated as a maximum of 500 tons, which can readily be distributed in ten hours by the conveyors through the power house. The object in placing the coal in storage at the rate of 100 tons per hour was to permit the storage bins to be filled during the night hours when the exposition was closed and thus obviate the necessity of switching coal cars through the grounds while the Exposition was open to the public.

The Link-Belt Machinery Co. have purposely employed, as best carrying out the idea of their exhibit, several different types of conveyors. The pivoted bucket carrier, through which all of the coal has to pass to reach the four distributing conveyors over the boilers, has to be in continuous operation through the day. These conveyors are of the pusher type, in which the coal is pushed along a steel-lined trough by steel pushers attached between two strands of roll-

The comparatively short time of the Exposition period it was felt did not warrant the expense of the installation of a system of conveyors for handling the ashes. These are drawn from the ash pits into small push cars on tracks in tunnels beneath the boiler-room floor and when a sufficient number of these cars have been filled they are pushed to the south end of the building, dumped into a steel hopper, from which they are fed to the Link-Belt elevator, this elevator being carried to a considerable height so that by means of a swinging spout the ashes it delivers can be deposited in railroad cars standing on siding.

The utility and economy of this general scheme of handling the fuel in a large power house can readily be appreciated by anyone watching the operation of the carriers for a few minutes and then endeavoring to imagine the number of men that would be required to distribute this coal, if it were possible, through the power house by hand. One cannot fail to be impressed with the entire freedom from noise and dirt with which the fuel is distributed in this power house.

The mixing tank and solution tank connected with the small plunger pump into the suction of the boiler feed pump used by the Dearborn Drug & Chemical Works in introducing their vegetable extracted preparations in their feed water treatment at their exhibit in the boiler house of the Exhibit is a practical demonstration of the great interest taken in the care of steam boilers. The preparation is reduced with forty parts of water to give a large volume of the solution to work with, and this solution is introduced into the feed water going to the boilers in such a manner as to charge every gallon of water with its proper amount of the preparation. In this manner the piping, valves, connections, boilers and all accessories are under constant protection by having the preservative composition of the preparation constantly in the water, and it also enables the engineer to keep his boilers perfectly clear with half the quantity that is needed in putting the daily dose in at one time.

Scientific boiler feed water treatment has been recognized as a necessity, and the old school of mechanically cleaning boilers and the indifferent use of caustic soda and all other injurious substances, without first considering the consequences, results, analysis of the water, the scientific solution of the difficulty, is a thing of the past. To-day it is an accurately well-defined branch of science, and the results can be thoroughly calculated in the laboratory by the analysis of the water and writing a prescription with the proper preparation, knowing exactly how the results will come out before even starting the test.

The A. Leschen & Sons Rope Co. have extensive exhibits and are well represented in Machinery Hall and also in the mining gulch. In the exhibit in the Machinery Hall is shown all of the classes of cable which they furnish and manufacture, as well as aerial wire rope tramways, suspension bridges, haulage outfits and other equipments involving the use of wire rope. The exhibit consists of an elaborate pavilion artistically arranged and built entirely of wire rope and wire rope fittings. In the center of the pavilion is one of the most complete set of samples ever exhibited, arranged in the shape of a cylinder and showing each individual type of cable which they manufacture.

Immediately to the east of this pavilion is extensive mountain scenery with an operating tramway model 16 feet in length, and built to a scale of 1 inch to the foot. This model shows the exact detail of the Leschen Co.'s automatic tramway and is built over a rugged contour representing a typical mountain scene in the Western mining camps.

A complete model of a wire rope suspension bridge is also shown in connection with the scenic effect and spans a wide stream over an extensive waterfall, having one approach at a manufacturing town, all minutely shown.

In addition there is also illustrated other tramways, as the conditions are found in mining camps, carrying the ore from different points to the millsites located below in the gulch.

A coal mine showing the tunnel and the approach is also illustrated, in which a complete haulage plant can be seen in reference to the mine from which the coal is taken. A Washington lumber camp is also illustrated, showing the method of logging heavy timbers in that section and the devices used for handling the immense logs. Other uses to which wire rope is applied is also shown throughout, this effect giving a visitor a vivid idea of the various uses of wire rope. This exhibit is located in Block 13, Aisle F3, in the eastern end of Machinery Hall.

Another fine exhibit in the same line is that of the Broderick & Bascom Rope Co., an enterprising St. Louis firm. The accompanying cut gives a faint idea of the extent and completeness of this splendid showing, which was designed and installed under direction of E. P. Frederick, the general superintendent and mechanical engineer of the Broderick & Bascom Rope Co. The biggest thing in this big display is the great spool of wire rope on their "Jumbo" steel wagon. People who have seen fifty-four horses pulling a new cable through the streets of San Francisco can form an idea of what this looks like when it is stated that this cable wagon has a capacity of 200,000 pounds. The spool holds 33,212 feet of 1½-inch steel wire rope,

Cameron Pump Exhibit at the St. Louis Exposition.

pattern," the regular horizontal outside-packed plunger pump, built in sections for muleback transportation, and the "Sierras" pattern, being the regular vertical plunger sinking pump of the smaller sizes, built in sections for transportation in mountainous countries or any region where small packages are necessary. The maximum weight of one piece is only 300 pounds. The New York office and works of the Cameron steam pump are at the foot of East 23rd St., but they have branch offices in the principal cities of the world.

Worthy of mention is the plant for handling fuel. It is designed to take coal from cars and deliver it into storage at the rate of 100 tons per hour, and to distribute coal taken from storage through the power house at the rate of fifty tons per hour. The Exposition Company has exclusive use during the exposition period of 250 self-cleaning cars to bring the coal from the mines, thus insuring themselves against a possible shortage of cars and also insuring themselves against

ing chain. All of the conveyors are driven by individual motors and by suitable arrangement of signals any one of the elements of the conveying plant may be stopped or started at once.

The supporting structure is for the most part of steel. The 500-ton storage bin, being only a temporary structure and entirely isolated from the boilers, is of timber construction, and the overhead conveyors, being well up under the roof of the power house, are also supported by light wooden trusses. All of the five-ton pockets in front of the boilers, together with all supporting structure, is of steel.

For operating the plant there are employed one overhead man to open and close the valves for distribution to the different boilers, an oiler and general utility man to see that the machinery is in good running order, and a foreman. In deference to the dictates of the labor unions, however, the employment of two electricians to stop and start the motors is necessary.

which weighs 137,000 pounds. In St. Louis, they tell me, it takes fifty-six horses to pull that steel wagon, and I believe it.

A revolving disk on each end of this "Jumbo" dis-

Ind., in Block 9, Electricity Building, exhibit generators and motors for direct and alternating current, switches, arc lamps, meters, regulators, transformers, alternators and other instruments. A handsome

ing and has remarkable ability to resist wear. A No. 7½ gyratory crusher shown in sections and a 2½ cubic yard steam shovel dipper complete is shown, to illustrate the application of manganese steel, and many other specimens of castings are on exhibition—such as toothed and corrugated rolls for crushing coal and coke, roll shells for ordinary Cornish rolls, several styles of gyratory crusher heads and concaves, jaw, check and toggle plates for jaw crushers, mixer blades, elevator buckets, gears, sprocket wheels and chain, also centrifugal pump bodies, liners and flyers for handling sand and gravel. A variety of mine carwheels made of manganese steel is shown, illustrating the toughness and strength of the metal.

In connection with the exhibit of the International Nickel Co., in Block 42A, are a variety of nickel-steel castings made by the Taylor Iron & Steel Co., illustrating the wide range of nickel-steel castings for gears, stamp shoes and dies, tires and die rings for Chilean mills and many other devices. H. A. Johann is in charge.

The American Well Works of Aurora, Ill., in Block 13, Mines and Metallurgy Building, and Block 35, Machinery Hall, have an exhibit which consists of a general line of well drilling machinery, gas engines, air compressors, deep well appliances, portable adamant coring machinery, which is operated by steam or gasoline power, and other interesting appliances of this nature.

The Crawford & McCrimmon Co., Brazil, Ind., Block 14, Mines and Metallurgy Building, and Mining Gulch, show hoisting and haulage engines, ventilating fans and acid proof pumps. They also have a ventilating fan operating at the anthracite mine in the mining gulch.

The Orford Copper Co., New York City, Block 42, Mines and Metallurgy Building, show the process of manufacturing nickel-steel from mines to finished product. This nickel-steel is shown made up in dredge buckets, pan bottom segments for grinding and mixing mill, tires for Chilean mills, roll shells for crushing rolls, shoes and dies for cement mill, nickel-steel rolls and many other devices. As is well known, nickel-steel is especially valuable for these purposes, owing to its ability to resist sudden shocks.

The concentrating mill, built by the Allis-Chalmers Co. for the Utah space in the Mines and Metallurgy Building, has proved to be an attractive exhibit at the Exposition. Under the direction of Prof. Bradford, of the Utah School of Mines, the mill is operated every day, and people crowd around to see it work. The ores worked are sulphide of copper and these, when concentrated, look like gold. As fast as the concentrates gather, they are filled into glass phials and given away to the crowd. Already the first supply of 20,000 phials has been exhausted and 50,000 more have been ordered. Director General Whitaker says that the phials, with their glittering contents, are proving valuable as advertising matter.

The Lanyon Zinc Co. has an exhibit in the Mines and Metallurgy palace to illustrate the present wide field of usefulness of zinc, and the possibilities of its substitution in many lines for more expensive alloys and metals. To this end they have gathered together and placed on view not only their direct product of spelter, sheet zinc, zinc wire, rod, tube and ribbon,

Exhibit of Broderick & Bascom Rope Company at the Worlds' Fair.

play is 8 feet in diameter and has thereon more sizes and shapes and styles of steel wire than one could imagine existed.

The wire rope fence is another thing that attracts universal attention. The display of this firm is one of the finest features of the fair.

The palace of electricity occupies a central position on the exposition grounds. It is a fine exhibit structure, pentagonal in shape, and surrounds a spacious court. Its east front borders on the grand basin, and from its southern exposure the Terrace of States and the cascades are in full view.

The exhibits within this palace cover all of the modern applications of electricity, and each department of education, science and industry, associated with electricity, is represented in about equal measure.

The retrospective exhibit is confined very largely to the fine demonstration made in honor of Thomas Alva Edison, in blocks 26 and 27. This exhibit is arranged in honor of Mr. Edison on account of the fact that 1904 is the twenty-fifth anniversary of the commercial perfection of the incandescent lamp, the agent which has been used so effectively in beautifying the exposition.

The exhibits which show the commercial development of electricity most effectively, in that they present its adaptation in industry, are located in the west end of Machinery Hall and in the northwest section of the Electricity building. In Machinery Hall large direct-connected operating units, ranging in capacity up to 3200 K. W., and of wide variety, are connected up with auxiliary exciting and switchboard appliances, as a part of the exhibitors' service power plant, and present a very imposing and animated picture.

In the Electricity building many exhibits in blocks 3, 4, 5, 6, 7, 8, 9, 14, 16 and 17 show to what perfection electrical appliances have been brought in adapting this force to the requirements of almost every branch of industry, enabling operations to be performed involving large amounts of power with greater certainty, greater regularity and greater delicacy of action than has ever before been possible.

In the southwest section of the building will be found the principal exhibits illustrating the use of the storage battery in connection with lighting plants, railways, telephone exchanges and other uses. All of the exhibits in the building are working exhibits, by which is meant that the machinery is in operation, bringing its adaptability to the work in hand vividly in mind by an actual demonstration.

The application of electricity to medicine is shown by the exhibits in the eastern part of section 4, where all the modern developments for the treatment of diseases by the aid and use of electricity are presented.

In the south and southeast sections are the principal exhibits illustrating the use of electricity in the transmission of intelligence. There are two elaborate working exhibits showing the development in the art of telephony and a number of other working exhibits demonstrating specialties in this field.

The Northern Electrical Manufacturing Co. of Madison, Wis., in Block 14, Electricity Building, show their make of motors direct connected to fans, blowers, machine tools, deep well pumps and other machines. These motors are direct connected, doing away with belting or gearing, and are provided with automatic controllers to start and stop them. They are of variable speeds, varying from 100% to 500%. F. S. Culver is in charge.

The Fort Wayne Electric Works, Fort Wayne,

switchboard is installed. J. W. Hilgeman is in charge.

The Wesco Supply Co., St. Louis, Mo., in Block 8, Electricity Building, have a large exhibit in connection with the Triumph Electric Co., Gardner Electric Drill & Machinery Co., Browning Electric Co., and other manufacturers whom they represent in St. Louis. This collective exhibit consists of motors, lamps, and a general line of electrical appliances of interest. A Gardner electric drill is set up. The whole is in charge of L. M. Zapf.

The Kellogg Switchboard & Supply Co., in Block 17, Electricity Building, show telephone switchboards, telephones, wire, cables, etc., in connection with the Kinloch Telephone Co. of St. Louis. A telephone switchboard is in operation. Mr. Turner is in charge.

The Weston Electrical Instrument Co. of Newark, N. J., in Block 25, Electricity Building, have virtually the only complete exhibit of measuring instruments at the Fair, which comprises portable direct reading voltmeters, circuit testers, ground detectors, ohmmeters, etc. This is in charge of Charles P. Frey.

The Commercial Electric Co., Indianapolis, Ind., in Block 14, Electricity Building, show a line of motors and dynamos.

Turning again to the Mining and Metallurgy Building, the Taylor Iron & Steel Co. of High Bridge, N.

Exhibit of the Lanyon Zinc Company at the St. Louis Exposition.

J., in Block 73, make a noticeable showing. The first exhibit that strikes the eye here is a very large revolving screen; 60 inches internal diameter with 21 feet length of perforated plates, the over-all length of screen being about 30 feet and total weight about 33,000 pounds. In this screen all of the parts subject to wear are of manganese steel. Manganese steel is a metal combining extreme hardness with much malleability and toughness. While it can scarcely be drilled or cut by any tool, it can be forged and bent and twisted cold into shapes without break-

but have shown as well numerous examples of manufactured products from various concerns throughout the country who have already been impressed with the feasibility of employing zinc for their several commodities. The real purpose of the exhibit naturally enough is to extend the consumption of zinc as widely as possible, and they have chosen this manner of exhibiting many zinc articles as one of the avenues towards advancing the interest in the metal and extending a knowledge of its usefulness, well realizing that the more general an acquaintance with its use

becomes, the better will it be applied, and eventually will be employed for a much wider diversity of uses.

The most striking feature of the exhibit, as illustrated herewith, is a zinc facade 66 feet long, of classic proportion, used as a background to the space, showing the application of zinc to architectural work such as doorways, cornices, gables, pediments, etc. It is enriched with stamped zinc ornaments, and various pictures of the company's works decorate the panels of this back wall. Upon the two large columns which are located symmetrically near the corners of the exhibit are displayed handsome stamped zinc lion heads and ornaments, church organ pipes of zinc, a large washboard showing the various styles of ribbing used in standard makes, a section of a flight of stairs, showing in a graphical manner the use of zinc stair tread, nosings and stair corners, white-bronze medallions, as well as the name and location of the company arranged in stamped zinc letters brightly burnished. Piles of spelter, reels of wire, a number of casks of sheet zinc, a box of flat sheets and a table of corrugated zinc, with a large display of wire rods, tubes and bands in the several show cases, display the direct products of the Lanyon Zinc Co.

The exhibit of the J. Geo. Leyner Engineering Works Co., in the palace of mines and metallurgy, is located adjoining one of the main entrances of the

special showings a whole issue of the MINING AND SCIENTIFIC PRESS could be devoted to a description of one of the exhibits here, and then the subject would not be exhausted. This is said to illustrate the extent and wide reaching nature of this great display.

St. Louis, August 20.

### American Mining Congress.

The first day of the seventh annual session of the American Mining Congress, which met at Portland, Or., August 22-27, was occupied with the usual preliminaries of welcoming speeches, appointment of committees and the president's annual address. On the 23rd, the first speaker was F. H. Newell, chief of the reclamation service of the United States Geological Survey, on the "Relation of Irrigation to Mining." In addition to explaining the relation of irrigation to mining, he asked for suggestions on the law of apex. "The connection between irrigation and mining is not obvious," said he. "The old hydraulic flumes of the West have in a number of cases been converted into parts of irrigation systems. Among these are the large systems of California, which have contributed to the progress and prosper-

of the realm." Speaking of the need of a Government assay office in Oregon, he said that as there is none nearer than Boise, Idaho, on the east, Seattle, Wash., on the north and San Francisco, Cal., on the south, and as "a large proportion of the gold product of Oregon is taken directly to smelters outside of the State, that by the time the report reaches Washington some other State than Oregon gets the credit."

This paper was followed by M. D. Leehey of Seattle, Wash., on "Mining Laws," who said that "two important decisions worthy of special mention were rendered by the Supreme Court of the United States during the present year. In re. Clipper Mining Co. v. Eli Mining & Land Co., the court affirmed the Supreme Court of Colorado and held that a valid placer location entitles the locator to the exclusive possession of the surface and that no one may enter thereon to prospect for unknown veins or lodes; that any such entry constitutes a trespass. The court decided in the same case that a placer locator may advertise in the usual manner the conflicting application for patent to a lode claim, thus determining a question of practice heretofore much in doubt. In re. St. Louis M. & M. Co. v. Montana M. Co., Ltd., the supreme court held that the owner of a vein must take his extralateral rights under adjoining territory, by a shaft on the vein and not by means of crosscuts.

"This same law of the apex, or so-called extralateral rights, still continues to be the most perplexing feature of the Western mining laws, and the one producing the most controversy. \* \* \* Naturally this has suggested an amendment abolishing the apex rule and providing for a grant of larger surface with no extralateral right. But a consideration of such amendment involves serious questions. Before any law is changed, two things should be clearly apparent—first, an actual necessity for the change; second, that the one proposed will afford the relief desired. \* \* \* Considering the question, 'Is the present apex rule wrong or unwise?' the theory upon which such rights are granted is that the discoverer of a vein shall be rewarded with its mineral. At the time of discovery he cannot always determine the strike of such vein upon the surface, to say nothing about its dip beneath the surface, and to protect him it is proposed to allow surface ground 1500 feet wide. But this will allow only 750 feet from the center of his vein, even if he is able to locate that center; and then to grant 1500 feet square, or two and one-half times the size of the present claim, simply withdraws that much additional ground from exploration by other prospectors, for usually but one vein at a time is explored by the locator." He argued that the miner will not give much time nor money to development of a vein near the edge of his claim, which gave promise of dipping outside of his lines; nor for the man outside to sink a shaft for an uncertainty. "Of course, such owners of adjoining claims might agree on a plan of joint development and division of profits. We are told that such has been frequently done in British Columbia, which has a similar law." History is cited to show that the modern extralateral right had its precedents in the European mining codes as far back as the fifteenth century. "Even if it had been the part of better wisdom to have adopted the 'plane' system of ownership in the beginning without extralateral rights, is it well to make the change now? A poor law after it has been interpreted and construed by the courts will often operate more equitably than a better law which is yet unsettled and whose terms are in dispute." The present law has now been largely covered by supreme court decisions and the miner knows where he stands, so that the litigation of recent years need not be expected to always continue. Conditions in Alaska were described to show the advisability of a modification in the application of power of attorney privileges in the location of placers.

In "The Mineral Resources of Oregon," by F. V. Drake, the speaker traced the development of Oregon and its camps from the discovery of gold in the Blue mountains in 1845 and on the Santiam river in 1847, giving the geological problems exhibited by the various sections, and enumerating the mineral assets of the State, other than gold; and showing the extent to which modern machinery and processes are being applied.

On the 24th papers were read by J. S. Crawford of Oregon on "The Relation of Electrical Force and Conditions of Geology;" J. W. Abbott of Denver, Colo., on "Mining Men for Better Roads;" F. W. White of Cleveland, Ohio, on "The Inventor of Mines." In the afternoon session El Paso, Texas, was selected as the meeting place for the convention of the American Mining Congress in 1905.

On "The Functions of the State Geological Surveys," E. R. Buckley of Rolla, Mo., speaking in defense of State geological surveys, explained the good these surveys, if properly managed, can do and the need of them in the interest of mining. "The field covered by the State Geological Survey trespasses to no extent on that of the mining engineer or of the field geologist. The State Geological Survey can be of the greatest service to the mining industry. The reports issued by the Survey covers the entire State in regard to minerals, and these reports are generally sought after by mining men. One function of the Survey is to collect specimens for work in colleges

The Leyner Rock Drill Exhibit at St. Louis.

building, opposite the Colorado State mining exhibit, and across the aisle from the exhibit of the Allis-Chalmers Co. It occupies a space of 30 by 62 feet. There is on exhibition a Leyner air compressor of the simple-actuated, two-stage type; also a compound-steam compound-air compressor of their latest pattern; a small belt-driven, single-stage Leyner compressor, operated by 20 H. P. Westinghouse motor, this smaller compressor furnishing the compressed-air power to operate one of the water Leyner rock drills. The drill is operated at stated intervals every day, always surrounded by an interested crowd of spectators. The drill operates in a substantial frame, mounted on double screw column as it would be mounted in mine work, drilling into a huge block of syenitic granite quarried at Iron Mountain, Missouri. The exhibit also includes an exhibition of the working parts of the Leyner drill, as a separate exhibition, and some of the special features of the Leyner compressors; also several of their newly designed hoisting engines. Heavy piling has been driven into the ground to a depth of 24 feet, and the compressors and hoisting engines are substantially mounted on foundations just as they are mounted in actual mine installations.

In mentioning the above the subject has only been touched upon. There are scores of others equally deserving, some of whom have had previous description in your columns and all of whom deserve the widest publicity, for their exhibits go to make up a liberal education in itself. Among those may be mentioned: The Union Steam Pump Co., Battle Creek, Mich., Machinery Hall; the A. S. Cameron Steam Pump Works, Block 33, Machinery Hall; the Fairbanks, Morse & Co.'s exhibit, Machinery Hall; the Crane Co.'s exhibit, in charge of Mr. Parks of Chicago, Machinery Hall; the Westinghouse Electric & Manufacturing Co., Block 7, Electricity Building; the Western Electric Co., Block 17, Electricity Building; the General Electric Co., Block 28, Electricity Building; the Jackson Electric Drill Co., Denver, Colo.; the Colorado Iron Works, Denver, Colo.; the American Concentrator Co. of Joplin, Mo., Block 4, Mines and Metallurgy Building; the F. W. Braun Co., Block 81, Mines and Metallurgy Building; the Watt Mining Car Wheel Co., Block 62, Mines and Metallurgy Building; the Wood Drill Works, Block 30, Mines and Metallurgy Building; the American Diamond Rock Drill Co., Block 10, Mines and Metallurgy Building; the Denver Engineering Works, Block 14, Electricity Building, and a hundred others.

It is a fact that in many of those splendid commer-

ity of the country. The basis for these schemes were the miners' flumes. By the Act of June 17, 1902, the proceeds of the sale of public lands in thirteen States and two Territories has been laid aside for the advancement of irrigation schemes in the West. Many of these schemes are far from completion, but many of them are under way. It is to the interest of the miner to aid the irrigation schemes for the benefit they will give him, when completed, in the way of water supply and if need be water for hydraulic purposes."

Following Mr. Newell, Gifford Pinchot, of the Bureau of Forestry, said: "The President's idea in creating the Public Lands Commission is to get at the best way of using and preserving the public lands of the United States, and particularly of the western part of the country. The question now is, 'How can we give the forested part of the public lands their best use?' The lumbermen want the forests reserved in order that their industry may be preserved. The grazing man wants the forests thrown open to grazing, and also wants the grass as well as the forests themselves preserved. As to the mining industry, you cannot run a mine without timber and water, and both must be near and cheap. The policy of the Government toward the mining man is to get the timber near enough for him to operate his mine at a profit. One of the misconceptions of the law creating forest reserves is that it prevents the location and development of mining lands. You can develop mines in forest reserves the same as you can elsewhere. You can also use the timber on the reserves to assist in developing your mine."

On the subject of "Government Branch Mint or Assay Office," United States Senator J. H. Mitchell, of Oregon, after giving statistics of the growth of the mineral industry of the United States, and particularly as to the production of the precious metals—and also showing the benefits derived by the farming interests of the country from the establishment of the Department of Agriculture, and by the commercial interests from the Department of Commerce and Labor—pointed out that, "the successful miner of the precious metals, while benefiting himself individually, is at the same time contributing to the national wealth and is therefore deserving of the sympathy, aid and support of the National Government. Some of the aids that can be properly extended is the establishment of mints and assay offices, smelting furnaces, etc., located at convenient places, so that the crude metals may be, at the least possible cost of both time and money, converted into the coin

and universities. A well-arranged cabinet of the minerals of the State and maps and charts is one of the most useful things that can be undertaken by the Survey. The Geological Survey is a department to which the citizen may apply for information on any mineral he may discover. The department should be a bureau of reliable information, and every State should have a department under the direction of thoroughly competent men. The State Geological Survey should be instituted to co-operate with the United States Geological Survey, the Bureaus of Forestry, Soils and the Reclamation Service. The field of usefulness of the Survey is in every State where mining is one of the industries and where it is possible to develop mining." John Daggett of California spoke of the growth of the mining industry in that State.

In the morning session of the 25th several resolutions were adopted, one of which asks that "the Government land laws be so modified that the same process shall apply in the patenting of agricultural, stone and coal lands, as in mining claims, and that notices shall be posted in the same manner prior to patenting. It is also required that persons patenting non-mineral lands shall be required to furnish evidence of their non-mineral character as positive as proof of mineral character as that which mining men are obliged to make." Another resolution reviews a late decision of the Secretary of the Interior interpreting the Teller law holding that monuments on the ground shall govern, and not the patent description thereto, in the survey of adjoining mining claims, and that great injury would be worked to the industry and the owners of patented mining claims by the application of this rule by its opening the way to falsified positions of mining claims. The Congress asked that such interpretation be adversed by the Secretary of the Interior, and that the law should be so modified as to prevent such interpretation in the future.

A. E. Borthwick of Idaho spoke on "The Mineral Resources of Thunder Mountain." He said a large part of Idaho is undeveloped, though seventeen out of the twenty-seven counties of the State are ore-producing counties. Owyhee, Idaho and Boise are the gold-producing counties of Idaho. There are good inducements in the camps of these counties and particularly in the Thunder Mountain district. The district has a radius of 30 miles and is on top of a watershed about 7000 or 8000 feet above the sea level. There is snow and plenty of it in the winter time, but by the first of May it is gone. A few of the groups of mines have been developed and have yielded promising results.

On "Copper Production in California," M. E. Dittmar of Redding, Cal., said: "The development of copper in California is not of recent date. The mines at Copperopolis, in Calaveras county, are being reopened, with good results. Shasta county has shown marked development in recent years. The Mountain Copper Co., in Shasta county, is averaging 800 tons daily (its full capacity is 1200 tons). Five furnaces are in operation, and its payroll for wages and supplies is running about \$100,000 per month. The total amount of copper produced since the Mountain Copper Co. began operations is 159,532,850 pounds, and the value of the gold produced is \$3,920,000. In Trinity county the development of copper is proceeding under favorable circumstances. A large amount of ore is ahead of the plants in the northern part of California. The largest bodies of developed sulphide ore are in Shasta county."

The afternoon session was taken up principally with debate on selection of a city for permanent headquarters, which was decided in favor of Denver, Colo.

The closing sessions of the convention were held on the 27th. "The Mineral Resources of Maine," by L. M. Lee of Maine, was read by title and ordered printed, as was also "The Theory and the Evolution of the Treatment of River and Beach Sands for the Recovery of Gold and Other Metals," by J. H. Ryan. A number of resolutions were passed, one of which recommended the opening of the south half of the Colville Indian Reservation in Washington on account of the mineral lands therein.

The following board of directors was elected: J. H. Richards, Idaho; T. Ewing, California; E. R. Buckley, Missouri; A. W. Gifford, Texas; J. Dern, Utah; W. Lennox, Colorado; J. F. Watson, Oregon; J. T. Cornforth, Alaska; G. W. E. Dorsey, Nebraska. After adjournment of the convention the board of directors met and elected J. H. Richards president, T. Ewing first vice-president, E. R. Buckley second vice-president and A. W. Gifford third vice-president. The offices of treasurer and secretary were left unfilled till the next meeting of the board.

### Air Hammer Rock Drill.

A recent test of the drilling machine, "The Little Wonder Air Hammer Rock Drill," patented by Martin Harsoeg, Ottumwa, Iowa, was made at the Fulton Engine Works, Los Angeles, Cal., in which it is stated the drill was "able to eat a hole in hard seasoned granite at the rate of 5 inches per minute." The drill is simple in operation, the manufacturer says, and requires about 14 feet of free air per minute, striking 2500 blows per minute, and having

eight cutting edges on the face of the bit. It is also stated that it can be operated by a man in a sling over a ledge, or on a ladder, or wherever it is possible for a man to go, and that it will drill back holes

Air Hammer Rock Drill.

or directly overhead with equal rapidity. Irish, Chandler & Harris, 119½ South Spring street, Los Angeles, Cal., are sole agents for California, Arizona and Mexico.

### Electrical Precipitation in Montana.

#### NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by  
MATT. W. ALDERSON.

Very fair work was done when the plant was first started by zinc precipitation, but after a hundred tons or so had been treated the solution became so foul that successful precipitation could not be made without adding large quantities of fresh zinc daily. Thus the product was always low grade, incessant care was necessary, and, even then, results were uncertain. Electrical precipitation was finally attempted by M. Malm, and has been developed by him into a system with many decidedly advantageous features.

The Butters system is a modification or improvement of the system originated by Siemens & Halske. In the original system iron plates were

ables any voltage to be used which may be available. The main plates are practically 9 feet by 5. For convenience in handling, they are made in three pieces and are connected by "jumpers" of copper wire. For every inch of solution in the box, therefore, three volts are required, using one-quarter of an ampere to the square foot of anode surface. In the words of M. Malm:

"We happen to have a working current of 110 volts. That gives us 37 inches of solution which we can work on with that voltage, thus allowing thirty-six sub plates. If we had 100 volts we could have used 165 sub plates. You design your precipitation box according to the voltage you have in the existing plant—the greater the voltage the fewer connections necessary."

With other systems there is always danger of short circuiting by the buckling of the plates or of a piece of metal connecting one plate with another. In view of this, fuses are used in one way or another to connect the main-current wire with the plates. With the Malm system short circuiting is almost impossible and a fuse has never been blown on that account. In the Malm plant the writer has seen connection made between plates both by a piece of steel and by plates being buckled till opposite surfaces joined without disturbing the even flowing of the electrical current.

As shown by accompanying sketch, the Malm precipitation box is 19 feet by 9 feet in size, 5 feet in depth. The box is divided longitudinally into three sections, thus allowing plates 3 feet by 5 feet in size to be used, a size easily handled. Each plate has a small hole punched in the top into which a hook is inserted when one wishes to pull it out of the slot in which it stands, when necessary in cleaning up, or otherwise.

In the Malm system the plates are connected in series. The main cathodes and anodes have thirty-six plates between them, the plates being an inch apart. The current thus passes through thirty-six plates, or 37 inches of solution, in going from the positive to the negative, and the metal is deposited on the negative side of each plate. There is no flow of the solution. The fluid is run into the precipitation box, where it remains one and one-half to two hours, when it is run out. Precipitation is thus the same throughout the box. As most of the plates have no direct connection with the current, they may be taken out at any time for the purpose of removing the bullion.

Cross Section Malm Plant.

Vertical Longitudinal Section of Malm Plant.

used, which formed prussian blue with the consequent destruction of cyanide. This was finally overcome by using lead plates for cathodes and peroxidized lead plates for anodes. With these there was a large loss of lead, as it came off in the process of precipitation—recovered, to be sure, in the subsequent refining of the bullion, but nevertheless causing expensive renewal of the plates—and a cathode of tin is now used by Butters, at least, in his plant in Mexico. In the Butters system every other plate is positive and the alternates are negative. The deposit is formed on both sides of the cathodes, or negative plates, the positive plates receiving no deposit. The current passes but an inch of solution in going from one pole to the other, with an amperage of 0.2 to 0.25 per square foot of anode surface.

In the system installed by J. L. Malm for the Gold Cord Co. the precipitation box is arranged to conform to the working current of the plant. This en-

There are seven main plates in each box—four anodes and three cathodes—and each section of the box is divided into six compartments, each of which contains thirty-six sub plates. There are thus 225 plates in each section, 675 plates to the box, or 1350 plates in all, giving a total precipitating surface of 20,250 square feet. The plates are of No. 18 iron, and have a total weight of twenty-two tons.

(TO BE CONTINUED.)

PYRITE is usually bought on the basis of the units (20 pounds) of sulphur contained. The imported Spanish ore received at the port of New York contains from 46% to 52% and the domestic (due to impurities) from 42% to 44% sulphur. At New York it is worth about 12½ cents per unit, or \$5@56 per ton of ore. Much of the pyrite on the Pacific coast contains copper.

## Colorado Railway Enterprises.

TO THE EDITOR:—Numerous railroads and tramways have been projected to the sulphide belt of Colorado in Clear Creek and Gilpin counties, which, in connection with the general progress of this great mining section, promise to be of great service in handling a large tonnage of low-grade ore at a minimum cost.

Up to this time but one railroad, the Colorado & Southern, has penetrated this section. The road is a narrow gauge, the main line running through Idaho Springs, Georgetown and intermediate points to Silver Plume along South Clear Creek, and a branch extending from Forks Creek along North Clear Creek to Black Hawk and Central City.

Independent of this was operated the Gilpin tramway, comprising twenty-five miles of track leading to the principal mines lying between Central City, Black Hawk, Nevada and Russell Gulch, representing in a small area the principal producing section of Gilpin county.

The announcement is now made that this tramway has been purchased by the Colorado & Southern, and that an aggressive policy of improvement will be inaugurated at once. The price quoted in connection with the sale is \$150,000. The Colorado & Southern has 3-foot tracks, while those of the tramway are but 2 feet. It is not the intention, therefore, to operate the roads in connection as the term is generally used in railroad circles, but the consolidation will nevertheless afford many opportunities for co-operative operation.

At present the tramway is equipped with ten side-wheel, slow-speed engines, built especially for steep hauls. The road has about 160 of the small cars, and is otherwise equipped in proportion. It is used exclusively for hauling ore from the mines, and for conveying coal and supplies to the mines from the railroad. It is said to be at present handling about 6000 tons of ore per month, and while for a number of years it has been a god-send to the miners of this important section, the announcement of President Trumbull that the new owners will add to and improve the equipment is a timely one.

Besides the improvements of the line already constructed, they have already undertaken the work of projecting extensions. It is their avowed intention to reach every important mine within a radius of many miles.

The most important extension represents a triangular territory just above Central City. The little camps of Apex, Perigo and Gilpin have some producing mines of importance and many promising prospects. They have been kept alive and progressing to an extent by a vigorous set of miners, who have maintained an abiding confidence in the virtues of their section, and a similar belief that it was only a question of time when the problem of transportation would be solved for them. Even under the disadvantageous circumstances some of the properties have been made to pay, and now that the railroad people promise the extension of the Gilpin tramway to these and intermediate points, the mining world may look for important developments from this section.

Railroads generally have grown to look upon the extension of spurs into new mining sections as of doubtful profit. Hence they quite frequently defer these extensions as long as possible. In this case the action of the Colorado & Southern is probably stimulated by the advent of the Moffat line. This new railroad will run near the county line between Gilpin and Boulder county; thus the extension of the Gilpin tramway to the points above Central City will have a decided tendency to attract ore from several promising camps near the Moffat line to the Colorado & Southern.

In this connection it is important that the Colorado & Northwestern, a railroad extending from Boulder to Ward in Boulder county and operated in connection with the Colorado & Southern, has decided to extend a spur to Eldora. This extension will run out from Sunset, and will open a meritorious but hitherto isolated district.

It will thus be seen that the Colorado & Southern seeks to attract all the ore possible from both Gilpin and Boulder counties, as these spurs will reach within a few miles of the Moffat main line on either side. That their action in so doing is wise is generally believed in railroad and mining circles. While the Moffat line is projected principally as a transcontinental line, backed by the Burlington route, it is the avowed intention of those behind the movement to extend branches wherever the opportunity affords for the development of the hitherto isolated mining sections.

Such was the policy of Mr. Moffat when he was in control of the Rio Grande. Several districts were virtually saved from abandonment by his enterprise in this direction, and it is claimed by many that several of these undertakings never did pay the company. But, on the other hand, it is held that the general policy proved successful, and that it is Mr. Moffat's intention to conduct a similar policy with the new road wherever the conditions indicate a justification.

When the Moffat line was first projected it was announced that these auxiliary lines were to be extended. Prior to that time a company headed by R. A. Hall was prospecting the field with a view to

extending roads from Central City or Idaho Springs to the Yankee Hill district, to afford that section an outlet for its ore, and develop the mineral and tourist possibility of an attractive district. No sooner than the main line of the Moffat was determined upon, however, than Mr. Hall altered his plans so as to connect with the Moffat line instead of the Colorado & Southern, thus enabling him to project a standard gauge instead of a narrow gauge road.

The Hall company has incorporated as the Clear Creek & Gilpin District Railroad Co., and a permanent survey has been completed from Pactolus, on the Moffat, to Central City. A branch to Central City from the Moffat was projected at the time the road was first spoken of, but it is not known definitely whether the Hall road has the official co-operation of the big line or not. It is probable, however, that when Moffat gets ready to go to Central City, there will be no differences between him and the Hall people.

Shortly after the announcement that the Colorado & Southern had bought the Gilpin tramway and would extend both this and their northern branch, Mr. Hall came out in a rather spirited newspaper interview, which indicated an open fight for the Gilpin business, reflecting the somewhat unusual condition of a rate war before the railroads are constructed. Such a condition cannot at this stage of the game be considered very seriously, but enough is developing every day to justify a well-based enthusiasm on the part of the miners of Gilpin county. The railroads may finally agree on the division of the spoils, but it is reasonably sure that there will be new sections opened up by the extension of the railroads and tramways.

Over on the Clear Creek side there is another interesting railroad situation. It looks as though Sam Newhouse was at last going to realize his ambition and complete a railroad to connect with the Newhouse tunnel at Idaho Springs. At a recent sale of the Denver, Lakewood & Golden Railroad, it was bought in by Newhouse representatives, and reincorporated under the name of the Denver & Intermountain Railway. The Denver, Lakewood & Golden has led a precarious existence for a number of years, operating between Denver and Golden. This spring the Denver tramway extended their electric line to Golden, which was generally considered as sealing the doom of the Lakewood so far as local business was concerned. There are now three lines to Golden—the two mentioned and the Colorado Southern—so that it is manifest that Newhouse didn't buy it in for its present worth.

It has always been the intention of Newhouse to have a railroad connecting with the mouth of his tunnel at Idaho Springs, to convey the product of the tunnel to the smelters in the valley. The renewal of work in the tunnel, extending it farther into Gilpin county, under a contract with the Saratoga owners, and the purchase of the railroad, certainly may be accepted as justification for the present rumors. There have also been rumors that the tramway (which, by the way, is controlled by the Moffat interests) may extend to Idaho Springs, but it is not reasonable that both these lines will be extended in this day when the "community of interest" is so recognized by capitalists.

Two other independent railroads and tramways are being planned for Clear Creek county. One is to connect with the Colorado & Southern at Dumont, and extend to Lamartine. This will probably be a tramway, as the course projected is a very steep one. There are good men behind this scheme—Lafayette Hanchett, manager of the Newhouse interests; Roscoe B. Morton, owner of the Jo Reynolds mine, and others who are not given to propagating hot-air schemes. If the project is carried to completion it will furnish transportation facilities for a number of shipping mines, including the Jo Reynolds and the Lamartine, besides opening up for the prospectors a promising low-grade section where it is not now possible to work.

Another and more extensive scheme represents an extension from the Colorado & Southern at Silver Plume. This is backed by the owners of Hazelton-Santiago mines, and is projected to extend through the Argentinians and to some of the attractive lakes of that interesting section, thus proving desirable both as a tourist attraction and a mining enterprise. There are also several schemes for crossing the range by rail, but these enterprises have little possible bearing upon the development of the section in question.

That the plans of all these railroads will be altered materially before completion is exceedingly probable. As yet they are mainly on paper. But the circumstances surrounding the instances practically assures the completion of the most of them, or of enterprises as advantageous as those at present outlined.

This will mean the creation of a number of new districts, and a new lease of life for several sections which have simply existed for years, making prosperous mining communities where prospects existed before, as well as adding to the richness of the sections which have already been proven a success. This will unquestionably give a wonderful impetus to the mining industry of this section, and add materially to the production of the State.

W. H. CUNNINGHAM.

Idaho Springs, Colo., Aug. 30.

## The Ignition of Gasoline Engines.

Written for the MINING AND SCIENTIFIC PRESS.

A mining man of Colorado, who purchased a gasoline engine a year ago, recently wrote to the manufacturers of the engine as follows: "My engine generally is a source of satisfaction and profit to me and I would not do without it for twice what it cost. There are times, however, when it seems to have spasms of mulish tantrums, and my list of swear words is entirely too short for satisfactory use when it turns mule and refuses to go. It seems to me that the ignition of a gasoline engine causes me more trouble than all the other parts of the machine together.

"My batteries are the chief source of trouble, as they seem to die out at the most unexpected times, and also when my engine is needed the worst. This sometimes means a delay of half a day, as it is often necessary to send for renewals. Moreover, the cost of renewals is so great that my engine costs more to run than it should. Can you not suggest a remedy?"

The above is probably but one instance of many similar experiences. The gasoline engine is certainly a boon to the miner, as it furnishes power wherever needed and theoretically at a minimum of cost.

It has been but a few years since nearly every gas and gasoline engine was ignited by a hot tube or torch. This means of lighting the charge in the combustion chamber of the engine was uncertain, dirty, expensive and dangerous. To-day there are very few engines that use the hot tube, so the motor builder discarded it in favor of electric ignition, and at present the electric spark is the principal method of ignition on automobile, marine, traction and stationary gasoline engines.

While electric ignition is superior to the old-time means, there have been disclosed a few defects in the new system, and as will be seen from the letter quoted above, the source of current used is the chief cause of trouble.

For this work, liquid primary batteries of many types and storage batteries of various designs have been used.

Salammoniac batteries, bichromate of potash batteries, caustic potash batteries and many other kinds have been tried and are still installed for stationary work. They all give an ample supply of current for a time, but soon become exhausted and need renewing.

This invariably means dirty work, trouble, annoyance and expense for the owner of the engine. Storage batteries are not adapted to use on the mine engine, as the average miner has no immediate means of recharging the same. If a battery at all is used it should be simple, easily renewed and inexpensive.

A battery filling these requirements has never been made, but the dry battery of to-day, thrown upon the market by the millions, has been very generally adopted for automobile work and can be used likewise for stationary engines. It is simple and compact; it gives an ample supply of current when new, but its length of life is short and uncertain. It may last three months or three days; the user never knows how long until his engine stops and he finds his cells dead. They must then be relegated to the scrap heap and new ones installed.

Some manufacturers have followed the lead of the continental makers in the use of dynamo and magneto generators, others have seen and appreciated the sphere of usefulness of mechanical generators and yet have hesitated to adopt the same for their engines, merely because of the additional expense involved.

To the unbiased but experienced user of a gasoline engine, it seems that it can only be a question of time before every maker will equip all machines with a mechanical generator, either as the sole source of current or to be used with an auxiliary set of dry batteries.

The latter combination is a good one, as the batteries can be used for starting, thus getting rid of the necessity of cranking to get the initial spark from the generator. After the engine is started it is an easy matter to throw the switch from the battery to the dynamo and so let the latter do the heavy work of furnishing the current just so long as one wishes to run the engine. If used only for starting, the batteries will last a long time, generally a full season, before they will need to be replaced.

And now a word regarding the kind of generator to buy. It is not necessary to look to France or Germany for a high-priced machine that will do the work and do it effectively. We can find American-made dynamos and magnetos that surpass the foreign-made generators in every respect. If you use the make and break or contact system, a magneto will answer your requirements. A magneto is a generator with permanent magnets and is inexpensive. There are at least a dozen American-made magnetos on the market that will give ample current for successfully working a primary coil. Select one that will give about 10 volts and 1 to 1½ amperes at its established speed, but do not expect a machine of this type to do good work with a jump-spark coil.

The jump-spark system requires higher amperage and this is found in a dynamo only, which should give 10 volts and 4 amperes if used on the average secondary coils found in the American market.

The dynamo is the only practical source of current

yet discovered for electric lighting and electric power work, and it seems absurd for the motor world to depend on uncertain chemical processes for ignition when a small dynamo will mechanically generate current year in and year out at practically no cost after the original expense of installation. Dynamos for this work may be found, and are just as perfectly made and work just as satisfactorily as the dynamos found in central electric light stations.

### Mining in Mineral County, Colo.

[FROM A STAFF CORRESPONDENT.]

For several months past the mining industry has been improving in this county. Between 8000 and 9000 tons of ore and concentrates are shipped each month. Labor difficulties are practically unknown in this district. The union is under control of the conservative element.

The Mollie S. Mining Co., under the management of R. S. Light, is doing development work and shipping some ore. This company is building an 1800-foot tramway from the mine to the wagon road. The company is the owner of four claims.

The Humphrey Tunnel M. Co. is handling 200 tons of ore daily at their mill. This ore comes from the Big Kanawha Leasing Co. The mill contains 10x20 crusher, ten trommels, twelve jigs, two Bartlett and twelve Wilfley tables, three 5-foot Chilean mills and one 200 H. P. compound Corliss engine. The power is transmitted to the mill by a rope drive, which consists of six 1½-inch Manila ropes. Two Pelton water wheels are used to help out the steam plant whenever the water supply is sufficient, and at times the water supply is ample to enable them to run the entire mill with water power for several months. The water depends almost entirely on the accumulation of snow during the winter. When the mill was erected there was ample water to run the year around, but the past few years the snowfall has been light. They are turning out a lead concentrate which carries about 70% lead and one to four ounces in gold. They also make a zinc concentrate which runs about 50% zinc, with gold and silver values. The ore is very hard and refractory. L. H. Norton is superintendent and J. J. Fitzgerald is mill foreman.

About 2 miles from the Humphrey mill is located the old Solomon mill, on East Willow creek, now owned and operated by the East Willow Mining Co., Chas. Loughridge general manager and F. Spurr superintendent. This company are owners of the Ethel-Solomon and Holy Moses group, located on Campbell mountain above the mill. They are treating forty tons of zinc-lead ore at the mill daily. The tunnel through which they are operating is 2700 feet in length. The vein is from 10 to 12 feet wide of low-grade ore, with some rich pockets. In the mill they are turning out a 75% lead concentrate and 60% to 61% zinc product. A 1000-foot shaft will be sunk from the tunnel level, 2500 feet from the tunnel entrance. They are putting in a Rand duplex compressor and pipe line to the shaft. As soon as they open a level from the shaft, they will double the capacity of the mill. At present they are working the Solomon mine through the Ethel tunnel.

A short distance above the Humphrey mill are located the Commodore Nos. 5, 3 and 4 and the Bachelor. Near the Bachelor is the Wooster tunnel, which is now something over 14,000 feet in length, and through which the Big Kanawha Leasing Co. are operating the Delmonte and Happy Thought. Ore from the New York and Last Chance is hauled down by wagon. Ore from the Delmonte goes direct to the smelter.

The engraving herewith shows the Last Chance, Amethyst and Happy Thought, and about 3 miles

away on the hill in the distance is the Captive Inca mine. Considerable work is being done on the Inca and good ore is reported. F. G. Boyle has charge of the work on this property. He also has charge of the Bachelor.

The Amethyst is producing some ore and development work is in progress.

The Commodore ore, from tunnels 3 and 4, is taken down to the railroad by aerial tramway. H. E. Lees is superintendent of the Big Kanawha L. Co. Creede, Colo., Aug. 20.

### A Record Pump.

TO THE EDITOR:—"After having been in acid-water service for eighteen years and then submerged for two years and a half, the Jeanesville pump in the No. 4 slope of the Lehigh Valley Coal Co.'s mines at Jeanesville, Pa., started pumping again as soon as we turned on steam." That statement aroused my curiosity, and I asked the mine superintendent to take me to see the pump.

The little mining town of Jeanesville lies in a valley some 2 miles south of Hazleton. For upward of forty years the Jeanesville mine has been turning out a high grade of anthracite. The principal vein averages from 20 to 40 and in some places as much as 60 feet in thickness. The coal in this vein is practically all taken out. The Buck Mountain vein below has never been worked, but is of an exceedingly high-grade coal, and operations are now under

the pump and the height to which the water rose over it.

Two Jeanesville pumps were put into the No. 4 slope, and after two years and a half the water was lowered to the second level shown on the diagram. When this level was reached, a pump runner swam into the pump room and turned on the steam. The pump, which had been submerged for two years and a half, started instantly, while still submerged, and in a few days had rid the mine of all surplus water. When I saw this pump, a few days after the steam had been turned on, it was still covered with the slimy deposit left by the water. This slime was so acidulous that I was not surprised to find the next morning that it had burned three or four holes through my overalls where it happened to touch them.

When it is considered that the pump was twenty years old and had been pumping water steadily until it was flooded, and then for two years and a half it had been submerged, it seems to me that the pump has established its acid-resisting qualities to a most remarkable degree.

JOHN M. BRUCE.

Jeanesville, Pa., Aug. 25.

### Production of Lithium in 1903.

J. H. Pratt predicts that the production of lithium minerals will be considerably greater in 1904 than it was in 1903. He is the author of a report on the production of lithium in 1903, which appears as an extract of the annual volume "Mineral Resources of

Diagram Showing Submerged Pump.

way for opening it up. Some two years and a half ago, during a tremendously heavy rain storm which flooded the entire valley, there was a "cave-in" opening into the Mammoth vein, near the No. 1 slope of the Jeanesville mine, and the stream, which had overflowed its dikes, poured in torrents into the mine, completely filling it. At the foot of the No. 4 slope, which connects with the No. 1, is a duplex plunger pump with wood-lined water end, which was built by the Jeanesville Iron Works Co., and has been in continuous service since 1884, when it was installed in the mine. The water in this mine is exceedingly acidulous, averaging nearly 120 grains of free sulphuric acid per gallon. This is a remarkable record when it is considered that the pump has been in continuous service up to two years and a half ago, when the flood occurred.

The accompanying diagram shows the position of

the United States, 1903," soon to be published by the United States Geological Survey. The quantity of lithium minerals produced in the United States in 1903 amounted to 1155 short tons, valued at \$23,425. This is a decrease of 905 tons in quantity and of \$2325 in value as compared with the production (1245 short tons) and value (\$25,750) in 1902. The demand for lithium minerals increased considerably, however, toward the close of 1903, and this fact is the basis of the prediction. Owing to orders received from abroad, a number of owners of mines that produced no lithium in 1903 began mining in 1904. As the uses of lithia are limited, there could easily be an overproduction of the crude minerals; but if the cost of these could be reduced, so that they might be used in the manufacture of lithium carbonate or nitrate for red fire in pyrotechnics, there would be an increased demand for these lithium minerals.

The only localities where lithium materials were produced in 1903 were at Pala, San Diego county, Cal., and at the Etta and Bob Ingersoll mines in the Black Hills, South Dakota. Three different minerals are mined at these localities for their lithium contents. They are lepidolite and spodumene, both lithium silicates, and amblygonite, a lithium phosphate. The amblygonite contains the highest percentage of lithia.

Both lepidolite and amblygonite occur at Pala. The deposit of amblygonite was discovered in 1902; since then it has been thoroughly developed. It is estimated that over 400 tons of this mineral are now exposed there. The production of lithium minerals from this locality in 1903 was, however, restricted by litigation. Lepidolite has been recently discovered in two new localities, one 7 miles northwest of Julian, San Diego county, Cal., and the other near Banner, San Diego county, Cal.

All of the spodumene is obtained from the mines in Custer and Pennington counties, Black Hills, South Dakota, and principally from the Etta mine.

The lithium minerals mined are shipped to New York, where a part is exported and the remainder is reduced by chemical companies.

It has been estimated that about 55,000 pounds of lithium salts are used in the United States each year, of which usually about one-third are imported. In 1903 these imports amounted to 5596 pounds, valued at \$3669. In 1902 the imports were 5530 pounds of lithium, valued at \$8038, and 15,686 pounds of other lithium salts, valued at \$14,913.

The Last Chance, Amethyst and Others Mines, Creede, Colo.

# Assay Maps.

Written for the MINING AND SCIENTIFIC PRESS by  
ALGERNON DEL MAR.

I mentioned in a previous article that a mine should be mapped in regard to assays as well as to the workings. Since then I have been asked what an assay map was, and thinking perhaps some of your readers may like a few ideas upon the subject the accompanying sketches may prove of interest. An assay map is a graphic illustration, plotted to scale, of the amount and value of ore in a mine. There are many ways of accomplishing this, the simplest perhaps being as shown. In both examples the drifts and adits are represented as being straight; the uneven line above the levels and to the right of the vertical connections represents the widths of the ledge at the respective places, while the line under the levels and to the left of the raises represents the values. These lines may both be on the same side, one dotted and the other red, or both red, on different sides. In

FIG. 1.

Fig. 2 double lines are used for connections between levels. The question may be asked what these maps show. It simply puts before one's eyes the mine in its commercial dress, for it shows the figures of a mine's value and the chances of future bodies of ore. It may prevent the pernicious habit of averaging, where one high assay will bring up unpayable ore sufficient to deceive one not familiar with mining and the vagaries of formations. Now, look at Fig. 1. This shows a ledge uneven as to widths and values, but continuous as far as developed. In this ore shoot, which trends to the right as we go down, are three different swells, which appear to be well defined. It shows a small ledge with high values, a proposition for a 5 or 10-stamp mill. Now, where one is informed that this ledge is on a contact of granite and a diorite dike, the mine and its chances form a clearer picture than a mere list of assays. These assays were taken between walls at every 5 feet, and where the formation was at all broken or soft a proportionate quantity of waste was allowed in the sample to offset the difference between theoretical and actual mining. It is needless to say that this mine was developed before any milling was done.

If we wish to theorize, it is possible by this map to form a conception of the original fissure, a line of weakness into which was intruded this hanging wall dike. For example, if we draw a line comprising three curves, Fig. 3 to represent the original fissure, and

FIG. 3.

FIG. 4.

imagine the foot wall to have slipped to the right, or the hanging wall to have been thrust up and to the left, we then have a fissure represented by Fig. 4, the places of contact (A B C D) forming arches which hold the fissure open for the deposition of minerals and at the same time throws the shoot of ore to the right in depth.

In Fig. 1 the dotted and straight line over the workings (A B) shows width and values of outcrop.

Fig. 2 shows a mine with irregular bodies of ore irregularly distributed, but with some uniformity in this irregularity, for these bodies or lenses occupy certain planes, and one is led to expect ore at M and also by continuing the adit E. It also shows that, these bodies of ore being small and limited, the levels should be run correspondingly close. It indicates a mine with a ledge in all the workings, presumably a fissure vein, the swellings only containing ore of sufficiently high grade to pay. It also shows at F, in adit C, how one can be deceived by taking assays at random, for here is an \$80 assay, while on either side is ore too low to pay. To make sure of this a raise

was put up, showing it to be a "freak" only, or, at best, an isolated spot of enrichment.

One would be surprised to know what a great help a map like this is to a mine superintendent or to the directors, for it pictures at a glance the whole aspect of the mine.

## Treatment of Stagnant Waters With Copper Sulphate.

In many mining towns situated in mountainous regions, as well as in the cities located in the valleys, the domestic water supply is one of great importance, particularly during the summer, when the supply diminishes and the reservoirs become stagnant. In a great many cases much sickness results from the continued use of this stagnant water. It is a question of great importance to every community, and in view of this fact the following extract from a paper read by Eugene Carroll before the American Society of Civil Engineers is of interest, and the suggestions it carries with it may be acted upon at any

the experiment. Samples of the scum were also examined and found to contain 11 1/2% of metallic copper, showing that a large amount of the copper was taken up by the anabaena and other organisms and thereby removed from the water.

During the first twenty-four hours the water in the reservoir exhaled a more pronounced and disagreeable grassy odor than before treatment. Its color at the end of the first twenty-four hours was a decidedly dirty green, with comparatively little scum floating on the surface, and upon testing 1000 cu. cm. of the water for copper at this time a very faint reaction was obtained. The sulphates in the water were slightly higher and the odor was considerably less.

At the end of the second and third days very slight changes were noticed in the color and taste of the top water, but it was greatly improved in taste, color and smell below 20 feet in depth.

At the end of the fourth day a continued improvement was noticed in the taste, color and odor, and at the end of the fifth day there was a very decided change for the better in color, the water assuming a

FIG. 2.

place where the stagnant water of reservoirs threatens all with illness who are obliged to use it.

In 1892 the Butte City, Mont., Water Co. began the construction of a large impounding reservoir about 13 miles south of Butte on a mountain stream having its source in the summit of the Rocky mountains. The plans called for a masonry dam 120 feet high, with its crest at an elevation of 6000 feet above sea level.

During the summer of 1893, the dam being only partially constructed and then impounding about 40,000,000 gallons of water, the stored water became unfit for domestic use on account of the disagreeable odor and taste.

In 1894 the dam was increased in height to an elevation of 5960, giving a reservoir capacity of 180,000,000 gallons of water. The same trouble was experienced during this summer as the previous year and further work was stopped on the dam until some remedy could be discovered.

Correspondence was opened with G. T. Moore of the Department of Agriculture, with a view of treating the Basin Creek reservoir and eliminating the vegetable organisms in that body of water. After some correspondence and investigations, the reservoir was treated as described.

The Basin Creek reservoir has two forks—one extending about 1/2 mile in a southerly direction and the other about 1/2 mile in a southwesterly direction. Distribution of the copper sulphate was started at 2 p. m. on July 7, using three boats—one boat distributed in the southern fork, another in the southwestern fork and the third boat in the main body of the reservoir in front of the dam. The quantity used was one pound of copper sulphate per 1,000,000 gallons of water, thus requiring 180 pounds of sulphate. One boat distributed forty pounds per hour in the short arm. The second distributed sixty pounds in one hour and ten minutes in the main body of the reservoir around the dam, and the third boat distributed eighty pounds in the long arm of the reservoir in one hour and fifty minutes. In each boat two men were used—one to row and one to hold the gunnysack containing the sulphate over the stern of the boat.

There was a heavy wind blowing down-stream, which made it extremely difficult to row; but the boats were kept in continual motion from the time the copper sulphate was dropped into the water until it had entirely dissolved.

During the first ten minutes of the distribution of the sulphate nothing peculiar could be noticed in the water; but after fifteen minutes fine light-green threads began to float in it, growing steadily in number, until about thirty-five minutes after starting there had formed a yellowish-green scum over the entire surface of the reservoir. The phenomenon was similar to the formation of a very flocculent precipitate.

In about two hours the scum assumed a dark-green color, the borders turning slightly brown. At that time a sample of water was taken and carefully examined and a small trace of copper was shown by

natural color and only a slight odor and taste being noticeable on the surface. At 20 feet below the surface, at the end of the fifth day, the water was tasteless and odorless and of a bright, natural color. Very slight changes for the better were noticed on the seventh, eighth and ninth days, and on the tenth day the water apparently had assumed its normal condition.

Microscopical examinations of the water, however, during this period, revealed the fact that there were a few spores of the anabaena left in the water and that the asterionella had begun to increase again.

Owing to these conditions, it was deemed advisable to give the reservoir a second treatment of the copper sulphate, and on the morning of July 19, twelve days after the first treatment, a second treatment was given in exactly the same manner and with the same quantity as the first treatment.

After the second treatment very little change was noticed in the water on the surface of the reservoir and hardly any scum formed. Twenty-four hours after the second treatment the water showed a very decided improvement in color, with absolutely no taste or odor. On the third day the water was in an absolutely normal condition and entirely free from the vegetable organisms which had given us so much trouble in the past.

During the progress of these treatments the reservoir was entirely cut out from the city's supply and no flow through it was permitted, the overflow being closed and the water allowed to slowly rise. With the exception of occasionally opening the overflow to remove the scum which had blown down against the dam, and occasionally opening the blow-off pipe, there was no current running through the reservoir during the period.

On Sunday, July 24, the water in the reservoir being absolutely pure, for the first time in ten years, during the month of July, it was turned onto the city mains.

## Modern Metallurgy.

Dr. J. Douglas, in a recent address, remarked, says the American Manufacturer, that a significant example of the recovery of all the valuable constituents of an ore is afforded by the present treatment of that complex mineral, franklinite, by the New Jersey Zinc Co. The mineral consists of iron, zinc and manganese. Every attempt to extract its zinc by the Belgian method was futile, since the iron melted the retorts, but when the Wetherill process of magnetic separation was applied a pure zinc ore—similar to willemite—was recovered, and the iron and manganese could then be converted into spiegeleisen.

Thus by the co-operation of a modern method—electrical separation—to meet a demand for spiegeleisen, used in the manufacture of Bessemer steel, a mineral described by Birkinbine as late as 1899 as "generally included among the iron ores of New Jersey," which was substantially valueless a few years ago, has been rendered the reverse. As an

iron ore it was of little or no value because associated with so much zinc. As a zinc ore it was worthless because of its iron contents, and 10% of manganese added nothing to its attractiveness. Each of these metals was simply a deleterious waste product to the others. Now each adds value to its associate.

## The Desert Dry Lakes of California.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by  
G. E. BAILEY, E. M.

**DRY LAKES DESCRIBED.**—These dry lakes are described by scientists under the name of Playa lakes. Prof. Russell defines them as follows:

The name Playa lake has been applied to inclosed water bodies of dry climates which have little depth and frequently evaporate to dryness, leaving mud plains, or playas. In the typical examples found throughout the Great Basin their waters are almost alkaline and saline and almost turbid with fine salt, and probably chemical precipitates. Lakes of this class exhibit great variety and are the most irregular of water bodies. In many instances they hold their integrity for a number of years and only evaporate to dryness during exceptionally arid seasons. Again, desiccation is apparently the normal condition, and the basins are only flooded during times of unusual humidity.

The report on "The Saline Deposits of California" defines them as follows:

The places where soda, salt and borax are found have been called many names, such as dry lakes, alkali marshes, etc., and the term marsh has been especially misleading, because they differ so greatly from the Eastern marshes. They are desiccated lake beds, in which the more soluble salts, derived from the rocks of their watersheds, have concentrated for ages and now form fields of common salt that are in some cases many square miles in area, and hold brine in all stages of saturation in the deep ooze beneath their surfaces. They are not necessarily watery or soft. They are generally dry lagoons, with a surface incrustation of the salines in some form, such as soda, salt or borax, and the surface is variable in color. The appearance is often that of a bowl of a valley surrounded by barren mountains. At the

first fresh water lakes, as they were glacier fed; but, being without outlet, as they evaporated they became saline. Bulletin 24 says:

The glacier-fed lakes were at first fresh water lakes; but rivers take up a certain amount of saline matter from the rocks and soils, and such rivers emptying into lakes having no outlet make the water saline at last, as the saline matter leached from the earth accumulates in the lakes without limit. At the end of Paleozoic the portion of the Great Basin covered by Lakes Aubury and Le Conte subsided and was covered by shallow inland seas (not connected with the Pacific ocean), in which salt, gypsum and other salines were deposited by evaporation.

And in speaking of the origin of the sodas, it says:

Natural soda is the residue obtained by the evaporation of the waters of an alkali lake, or the sodas dug up from the dry lakes of the desert. It is composed of sodium carbonate and bicarbonate in varying proportions, mixed with impurities, the impurities consisting of three classes: First, when mixed with sodium chlorate and sulphate; second, with sodium chloride and bichlorate; third, with sodium chlorate and nitrate. The first class is known as soda, or salt beds, the second as borax beds, and the third as niter beds.

Dr. Gilbert in his monograph on Lake Bonneville says:

Most of the small closed basins are without permanent creek or lake, containing at the lowest point a playa or alkali flat—a bare, level floor of fine saline earth, or perhaps of salt, over which a few inches of water gather in time of storm. \* \* \* The playas are bare of all vegetation and are usually margined by a growth of salt loving shrubs and grasses.

Prof. Russell in his monograph on Lake Lahontan says:

When the heat of summer drives every drop of moisture from these deserts and white saline efflorescence appears, which is formed by the crystallization of various salts brought to the surface in solution by the action of capillary attraction, and left as the water that dissolved them is evaporated, incrustations of this nature sometimes cover areas many miles in extent, in the borders of the playas, and render the surface as dazzling as if covered by snow.

In 1883, H. G. Hanks, State Mineralogist of California, published a "Report on the Borax Deposits of

the salines of the desert forming large and most valuable deposits.

**THE SALINES ARE INCREASING.**—In studying these dry lakes, it is well also to note the fact that their saline contents are slowly but surely increasing. Each of the rare storms that sweep the desert leaches out more of the salt, soda, borax or niter from the sands of the ancient ocean bed and carry them down to the lowest pools, down to the dry lakes, where the hot sun soon evaporates the water, leaving their contents of salines. How large these accessions must be is well indicated in the description of the Armagosa river, in the ninth annual report of the State Mineralogist of California, which is as follows:

The Armagosa has its source in the State of Nevada, about 30 miles southeasterly of the State Line gold mines in Gold Mountain, and makes its first appearance at the northerly end of the oasis of Nye county of that State. Its general course is southerly until after passing through the Armagosa borax fields, near Resting Springs, down through a deep canyon, close to Salt Springs gold mine. There it suddenly changes to a direction almost due north, and is finally lost sight of near Saratoga Springs, Death Valley. The length of the Armagosa is about 140 miles. It repeatedly comes to the surface, flows a short distance and then sinks—its waters being absorbed by the sand until a higher plane of bed-rock is reached, when they emerge again to view. During its flow the river takes up to its full capacity the alkaline salts in the soil through which it courses. When it comes to the surface the water is charged with them and forms a dense, briny solution, so perilous that, though to the eye it appears pure and wholesome, death falls to the man or beast that may chance to drink of the stream. When the action of the sun evaporates these fatal waters, the residue is soda, borax and other alkaline substances.

It should be remembered that Death Valley is really the sink of the Armagosa river. What is true of Death Valley is also true of Soda Lake, the sink of the Mojave river, of Salton sea, which is the sink of Salton river, New river and several other streams. It is true of every dry lake, for they have no outlets and are all local sinks, differing only in the size of their watersheds.

**THE SALINE CRUSTS RENEWED.**—It is an interest-

Ivanpah Dry Lake, Fifteen Miles North of Vanderbilt, San Bernardino County, Cal.

bottom of the flat bowl is a vast deposit that looks like water, salt, dirty snow or chalk, according to local circumstances. Some of these bowls have a hard, yellow-brown floor of clay, forming excellent roads for heavy teams; but generally, on trying to walk across the bottom, one finds it covered with a sandy-looking crust, through which the feet may break or through which the traveler may suddenly drop out of sight, for below this crust there may be solid clay or there may be water and slime too deep to probe. After local storms, there may be real lakes for a short time. They have been formed, first, by the isolation of a portion of the ancient lakes in the elevations of their bottoms into land, or, second, by the indefinite concentration of river or creek water in a bowl or lake that has no outlet. In general, they are pools that are the remains of Lake Aubury and Lake Le Conte, Death Valley and Salton Sea being simply the largest and deepest of such pools. They are enclosed water basins, which have little depth of water on the surface and often evaporate to dryness, leaving mud plains, or playas. They may be miles in extent after a storm, but disappear as soon as the hot breath of summer touches them, becoming once more soda lakes, river sinks, etc. These ephemeral lakes exert a curious effect upon the scenery of these arid lands, with their smooth and cream-colored plains stretching often to the horizon, without even a shrub or spear of grass to break the monotony of the glossy surface. They are the playground of mirage and optical illusions; the heated air is filled with fairy cities, fanciful forms of mountains and grotesque caravans, that divert the attention of the experienced traveler from the fatigues of the journey and from the profound and oppressive stillness of these solitudes. They are perilous, however, to the thirsty or lost wanderer, for to him they are the Lakes of Tantalus, whose ever-receding waters are magical visions that cause Reason to topple from her throne and lure him to a cruel death. If the valleys look forbidding, yellow with sand and greasewood and spotted with dismal black lava buttes, yet they are brightened with beds of soda, salt and borax that gleam snow-white to the eye.

**POOLS IN THE BED OF A DEAD OCEAN.**—The history of the Great Basin, as pictured by geologists, shows that the arid deserts of to-day are but the dry beds of former oceans, and that the dry saline lakes of to-day are but the pools or depressions in the bottom or bed of the ancient oceans, where the saline contents of vast areas have been concentrated. Lakes Aubury, Le Conte, Lahontan and Bonneville were at

California and Nevada" as Part 2 of the third annual report of the California State Mining Bureau. In this report he says:

There are a multitude of lesser sinks, as they are called, which are subject to great vicissitudes. During a season of unusual rainfall, or a phenomenal winter accumulation of snow on the mountains, great sheets of water are formed in natural depressions on the alkaline plains, which, when the conditions vary, appear as extensive fields of dry, white, efflorescent salts, consisting wholly of soluble matters gathered by the water in its passage from the melting snows, which is left in a state of almost absolute purity.

In 1892, J. R. Spears of New York, the historian and writer, published the results of his trip to Death Valley under the title of "Illustrated Sketches of Death Valley and Other Borax Deserts of the Pacific Coast." His work is recognized as an accurate record of his personal observations. Mr. Spears says:

Moreover, they are all the sinks of mountain streams—there was no communication between them and the sea, because of changes in the climate and in the amount of rainfall, the water supply grew less and less and eventually each lake became a marsh.

Prof. Hanks also says:

Streams, generally small, which head in the snowy mountains, if they do not sink in the sandy desert soil, or wholly evaporate, give birth to alkaline lakes, of which Mono, Owens, Walker, Carson and Humboldt are the most important.

It is unnecessary to multiply quotations. Dr. Gilbert, the author of the monograph on Lake Bonneville, was for a number of years at the head of the United States Geological Survey. Professor Russell was Dr. Gilbert's assistant in the work on Lake Bonneville, before he took up his great work on Lake Lahontan. Their ability and authority are unquestioned. Henry G. Hanks was formerly in charge of the State Mining Bureau of California, and has for years been a recognized authority on the Pacific coast. The testimony of John R. Spears, and others who have visited the deserts, only corroborates the fact that even the casual observer cannot fail to note the fact that all the dry lakes are concentrations of

ing fact that the removal of the surface crusts does not exhaust the saline resources of these lakes. This fact is noted in Bulletin No. 24, describing the effect of the sandstorms as follows:

At the Searles borax lake it was found that, after a crust had been removed from one part of the marsh, it filled with water that soon deposited crystals of borax, and in six months the waters were blown so full of fine sand that the new crust contained 50% of sand.

At Searles lake, in San Bernardino county, the method of working was simple, consisting of scraping the crust into windrows and then gathering by carts and taking it to the works, 2 miles distant. It was noted here, in digging the crystals out of the mud, that the crystals grew. The holes left soon filled with water containing boric acid in solution—this, coming into contact with soda, formed crystals of borate of soda (borax), which were deposited in the mud. Large vats were dug in the mud and brush thrown in for the crystals to form on. On ground that had been worked over a new crust formed also, that was thick enough to remove in three or four years. Such growths give the following analysis:

	Six Months.	Two Years.	Three Years.	Four Years.
Sand, per cent. ....	58.0	55.4	52.4	53.3
Soda carbonate, per cent. .	5.2	5.0	8.1	8.0
Soda sulphate, per cent. .	11.7	16.7	16.6	16.0
Soda chloride, per cent. .	10.9	10.0	11.1	11.8
Borax, per cent. ....	14.2	12.9	11.8	10.9

It will be noted that the borax is richest at first, and that the sodas increase faster than the borax. The effect of the Æolian sands is especially noticeable. These analyses throw considerable light upon the genesis of the deposits.

(TO BE CONTINUED.)

A NEW ALLOY for anti-friction metal and for brushes for dynamos, says the Elektrotechnischer Anzeiger of Berlin, consists of copper intersected with particles of graphite. A plate sprinkled with graphite is dipped into a copper bath, when the copper is deposited on the plate and surrounds the graphite. The plate is then withdrawn and again treated with graphite, after which it is reinserted into the bath, and the two actions are repeated until the diameter required is reached. It is said that the friction on metal so treated slowly releases the particles of graphite, which then act as a lubricant.

Electric Drills.\*

Written for the MINING AND SCIENTIFIC PRESS.

The object of this article is to place the actual results obtained in operating an electric drill plant, which has been in constant operation for over two years, before the mining fraternity for their information and criticism. The writer will make no excuses for the many errors made in his efforts to make this type of electric drill a success. If he had realized the expense and effort required to get results, it is very likely this article would never have been written. When the Miami Mining Co. opened the Phoenix mine it became apparent that the most difficult problem to be solved was drilling in the hanging and foot wall rock. This rock is a metamorphosed diabase, dark green in color, very fine texture; hardness, 4.5; specific gravity, 2.921 to 2.9744. The composition of the diabase when taken 50 feet from vein is:

	Per Cent.	Per Cent.
SiO <sub>2</sub> .....	59.21	51.31
Fe <sub>2</sub> O <sub>3</sub> .....	2.96	3.72
Mn O .....	0.67	0.22
Al <sup>2</sup> O <sup>3</sup> .....	23.26	21.75
Mg O .....	2.75	3.69
Ca O .....	5.17	8.25
K <sub>2</sub> O .....	4.24	
Na <sub>2</sub> O .....	3.69	
Loss by ignition.	1.07	1.70
	102.42	100.20

Analyses of samples of the diabase taken from the foot and hanging walls close to the vein contact give:

	Per Cent.	Per Cent.
Si O <sup>3</sup> .....	87.10	89.00
Fe <sup>2</sup> O <sup>3</sup> .....	2.37	2.24
Mn O .....	0.22	0.18
Al <sup>2</sup> O <sup>3</sup> .....	3.60	3.73
Mg O .....	1.60	1.90
Ignition and alkalis by difference.	5.11	2.95

This metamorphic replacement of alumina and lime by silica has produced a difficult drilling rock. The ore is an iron pyrite, carrying gold values and from 1% to 2% chalcopyrite. The gangue is heavy spar and quartz, the heavy spar predominating. The average width of vein is from 16 inches to 20 inches. The drills which had been used in the mine averaged 10 feet to 15 feet of holes per shift. Labor at this mine is 75 cents per day—hand drillers, \$1.25. It seemed to be a case of hand drilling, or some more economical kind than the style of drilling used, if speed with economy were to be obtained. This view of the situation led the writer to seriously consider electric drills.

When this decision was made, many of the mines in Colorado which were or had been using electric drills were visited and different types of drills were examined from the constructive and mechanical standpoint. Five electric drills were put into service April 1, 1902, and have been in continuous use ever since. The mine is electrically equipped throughout with a 220-volt direct current. Therefore only the drills and motors were purchased. We have added two more drills to this equipment. The motors, flexible shafts, etc., were all purchased direct from the manufacturers. The drills were purchased outright and not on a guarantee.

The first serious difficulty met with was shafts. Several kinds of shafts were either tried or examined. The Stow flexible shaft, made in Philadelphia, was accepted as best. J. A. Roebing Sons Co. were asked if they ever furnished steel rope for cores. They replied that they had, but the purchasers gave them scant information as to results. An agreement was made by which they were to furnish rope, we to test it and give them test results. It was found that a 1-inch left-laid iron tiller rope with tiller wire-rope center was satisfactory. To make a core, one end of the rope is tied with wire about 2 or 3 inches from the end. The hemp was removed from the end and the wires then soldered into the terminal socket. One end of a soft iron ribbon-wire  $\frac{3}{8} \times \frac{1}{8}$  inch is also soldered into the socket with the rope. The piece of rope is then wound with this ribbon wire under a few pounds tension. The edges of the ribbon wire should be spaced about  $\frac{1}{8}$  inch apart when winding. The other terminal is then attached in the same way.

After experimenting it was realized that anything as water-proof as leather was not the right thing for a casing in this service. Different kinds of cloth were tried with encouraging results. The ordinary extra heavy cloth belting was tested. This made a satisfactory casing cover. This is always protected by winding with ribbon wire, using the same kind as that used to wind the cores. This casing is stiff enough, and does not burn out because it is or can be kept saturated with water. The Stow Flexible Shaft Co. of Philadelphia has developed an all-steel flexible casing which has been tested and retested here. It is now practically successful, and is the writer's opinion that this will replace the cloth casing and be satisfactory in every way. The present shaft is a distinct advance in the art of making flexible shaft for drilling purposes. Messrs. Roebing Sons Co. and Mr. Schoff, proprietor of the Stow Flexible Shaft Co., have not hesitated to spend money and time in assisting to arrive at this satisfactory result. The credit of the present shaft is in a large measure due to their assistance.

Fur'	150		68½	212' 9"	15	1 00 15 00 1 50 22 50	5 pounds S. grease.	
Total cost.		310	180½	452' 4"	31	77.50	\$1.00	\$117.45

The next difficulty to deal with was springs. The time in changing was one great difficulty. After much testing, a larger spring was used, with fewer coils and a washer at either end with internal extension sleeves, so that the spring could not compress beyond a certain point. This reduced the spring breakage to a moderate cost.

A comparison with double hand drilling is the only thing that will give an idea as to the difficulties encountered in cutting this ground. The men average about the same number of feet per week. From Oct. 18, 1902, to Oct. 10, 1903, the double hand drillers drilled 9098 hours, drilling 4591 feet 9 inches, or an average of .51 foot per hour.

From Jan. 3, 1903, to Oct. 3, 1903, an average of 3.12 electric machines were running, giving a service as follows:

Weeks.	Shifts.	Actual Hours.	Feet Drilled.	Cost of Repairs.
41	9,932	7,902	10,535 ft. 3 in.	\$2,182.62

Drills each cut per shift hour, 1.06 foot; drills each cut per actual hour drilling, 1.33 foot; repairs cost 20.71 cents per foot of holes drilled.

A watt meter placed on one of the drills gave the following readings and results:

Date.	Hours Actually Drilled.	Feet Drilled.	Watt Hours.
Sept. 25, 1902	1½	3 ft.	1,700
Sept. 26, 1902	3	7 ft.	3,400
Sept. 30, 1902	3	6 ft.	3,800
Sept. 30, 1902	4½	10 ft.	4,600
Oct. 7, 1902	4	10 ft.	2,500
Oct. 7, 1902	1	1 ft.	1,300
Oct. 7, 1902	2½	1 ft.	1,500
Oct. 10, 1902	3½	5 ft. 6 in.	2,200
Oct. 10, 1902	6½	9 ft.	4,500
Oct. 10, 1902	5	8 ft.	3,600
Totals	33½	60 ft. 6 in.	29,400

Horse power hours, 39.4; horse power hour consumed per hour actual running, 1.17; horse power hour consumed per foot drilled, 0.65.

These results were checked with a milli-ammeter. The drill motor consumed from 2.5 to 3.5 amperes when running in a hole not over 1 foot deep. Variation .2 to .3 amperes, with holes 4 feet deep, the motor consumed from 3.5 to 4.6 amperes. Variation .3 to .5 ampere. Voltage in all the tests read between 200 and 215.

The regular 2 H. P. iron-clad motor made by the General Electric Co. is a satisfactory machine. The cost of repairs and maintenances from April 1, 1902, to Dec. 31, 1903, has been \$163.87, three motors being in service practically all the time.

After the usual number of experiments the following sizes and shapes of steel were found the most satisfactory:

	Steel Diameter.	Bit Cross.	Length Grooved.
1	1½ in.	3½ in.	1 ft. 6 in.
2	1½ in.	2¾ in.	3 ft.
3	1½ in.	2½ in.	2 ft. 6 in.
4	1½ in.	2 in.	3 ft.
5	1½ in.	1½ in.	3 ft. 6 in.
6	1½ in.	1¼ in.	4 ft.
7	1½ in.	1½ in.	4 ft. 6 in.
8	1½ in.	1½ in.	5 ft.
9	1½ in.	1½ in.	5 ft. 6 in.
10	1 in.	1½ in.	6 ft.

Perhaps the best way to give a clear insight into the detailed performance of the drills is to give a few monthly sheets chosen at random from the monthly drill reports.

These selected are not the best or poorest, but are a good high and low average.

Power cost here approximately 1.2 cent per horse power hour.

Below is given the entire record of one drill. These with the above give a very good idea of

the condition and cost of operating this type of electric drill in hard drilling ground:

	Shifts.	Hours.	Hours. Actual	Drilled. Feet	Repairs, etc.
1902.					
December.....	26	260	135	189 ft.	\$44 00
1903.					
January.....	6	48	14½	23 ft.	1 75
February.....	21	152	84	97 ft. 6 in.	17 94
March.....	10	100	70	51 ft. 6 in.	9 50
April.....	16	160	118	198 ft. 6 in.	18 85
April.....	11	110	83	119 ft. 6 in.	7 88
May.....	12	120	77	76 ft.	21 70
June.....	49	490	355½	373 ft. 6 in.	62 33
July.....	16	160	113½	96 ft. 6 in.	15 74
August.....	3	30	20½	36 ft. 6 in.	00
September.....	12	120	83	134 ft. 6 in.	11 91
October.....	23	230	150½	354 ft.	26 70
November.....	26	253	177	262 ft.	44 73
December.....	43	418	293	470 ft.	62 76
1904.					
January.....	12	114	80½	100 ft.	67 00
February.....	24	228	162	196 ft.	34 76
March.....	8	80	59½	81 ft.	58 01
	318	3,063	2,076½	2,759 ft.	\$505 53

Drill running.....67.79% of total time  
 Feet drilled per shift.....8.7  
 Feet drilled per hour actual running time.....1.33  
 Cost of repair per foot drilled.....18.3c

Drill runners will soon prefer to run an electric drill. The usual difficulties—ignorance and prejudice—were of course encountered at the commencement. These were soon changed to intelligence and preference.

F. L. SLOCUM.

Concord, N. C.

## Mining and Metallurgical Patents.

PATENTS ISSUED AUGUST 23, 1904.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

EXTRACTING ZINC OR OTHER SULPHIDES FROM THEIR ORES.—No. 768,035; G. D. Delprat, Broken Hill, New South Wales, Australia.

Method of separating ores from their gangue by forming an aqueous solution of acid capable of reacting with ore to form gas and increasing density of solution by adding thereto suitable substance, then feeding mixture of ore and gangue to solution, decreasing density of gas as it is formed on ore particles, and removing ore particles to surface.

SAFETY DEVICE FOR OIL-WELL TORPEDO SHELLS.—No. 768,564; W. H. Ernst, Marietta, Ohio, and A. Cupler, Jr., Titusville, Pa.

Torpedo comprising shell, spaced-apart flanges upon opposite ends of shell, and cushioning means expansively held between flanges and having its interior surface engaging shell throughout, flanges preventing longitudinal movement of cushioning means.

ELECTRIC FURNACE.—No. 768,054; C. G. P. deLaval, Stockholm, Sweden.

Electric-furnace chamber having horizontal feed opening, escape opening and focus of electric heat within chamber and opposite feed opening; escape opening being located above feed opening and between feed opening and focus.

opening being located above feed opening and between feed opening and focus.

MINER'S SAFETY LAMP.—No. 768,497; A. Wiedenfeld, Bochum, Germany.

In miner's safety lamp burner containing wick tube, both burner and tube being each provided with slot, two slots being adjustable to form conduit reaching to top of burner; igniter, compartment composed of cover of lamp vessel, and cap or hood covering compartment and separating it from outside, compartment containing igniter and match in compartment.

SULPHURIC ACID PLANT.—No. 768,108; A. Zanner, Brussels, Belgium.

Plant for manufacture of sulphuric acid, comprising roasting furnace, Glover tower, heating flue for passage of sulphur fumes and gases from furnace to tower, and vessels for concentration of sulphuric acid located within flue and adapted to be inserted and withdrawn therefrom, vessels being provided with inlet or supply pipe extending through wall of flue so as to receive supply from without, and discharge pipe likewise extending through wall of flue, and vapor exit openings discharging into flue; inlet or supply pipe being located at end proximate to tower and discharge pipe being located at end proximate to furnace.

EXTRACTION OF METAL FROM ORES.—No. 768,319; C. H. Webb, Dorking, Eng.

Process for treatment of solid material by liquid and final separation of solid and liquid particles consisting of mixing of liquid and solid material in closed revolving filter, assisting and maintaining continued deposit and support, by constant vacuum on delivery side of filter, of solid residue upon filtering support so as to withdraw moisture therefrom, discontinuing vacuum to allow fall by gravity of dry residue from filtering support and removing residue from vat practically dry through suitable apertures.

GRAVITY INCLINE MACHINE.—No. 768,235; H. C. O'Brien, Athens, O.

In controlling mechanism of character described, combination of post, sheave journaled thereon, brake rim in connection with sheave, arms extended from post and adapted to support brake band, brake actuator and means connecting opposite ends of brake band to brake actuator.

EXCAVATING MACHINE.—No. 768,362; J. P. Gordon, Florence, Colo.

Combination of frame, scoop or shovel carried by same, and combined hoisting and draft rope or cable connected with shovel and adapted to operate same and advance frame.

CRUSHING OR PULVERIZING MILL.—No. 768,221; E. C. Griffin, Newton, Mass.

In crushing mill, metallic bed, composite frame thereon comprising upright timber standards supported at their lower ends on bed, metallic crosshead interposed between upper ends of standards and provided with check pieces to receive latter, intermediate crosshead forming integral part of crosshead, bolts rigidly connecting standards and crosshead, and lateral tension braces diverging from opposite sides of standards and attached at lower ends to bed, upper ends of braces being attached to crosshead.

# Mining Summary.

SPECIALY COMPILED AND REPORTED FOR THE MINING AND SCIENTIFIC PRESS.

## ALASKA.

The Alaska gold output for the fiscal year ending June 30, 1904, according to the Department of Commerce and Labor, amounted to \$6,328,524, while in the fiscal year 1903 Alaska shipped to the United States gold ore and bullion to value of \$4,754,578. These figures refer only to Alaskan gold, however. The same statistics noted an even larger quantity of Canadian gold shipped to the United States, through Alaska, though less than during the preceding year. In 1903 the aggregate shipment of Canadian gold to the United States through Alaska amounted to \$10,979,285, while during the year just closed the Canadian shipment aggregated \$8,555,600.

## ARIZONA.

### Cochise County.

It is reported the Copper Queen Co. will enlarge its smelter at Douglas. Four or five more furnaces will be added. The smelter is working nearly to its full capacity of 1500 tons a day. Increased ore production in the Phelps-Dodge properties in the southwest make it necessary to enlarge. W. Douglas is manager of the company.

### Gila County.

Gibson & Gibson, near Globe, have curtailed shipments of ore to the Old Dominion until the new smelter blows in. The upper tunnel is being driven to connect with the Gibson shaft, and this work will be finished by the time the hoisting machinery is set up at the shaft. A steam hoist will be put in.

D. P. Fuller, superintendent of the Pinto Creek M. & S. Co., operating near Globe, says a compressor and three air drills will be put in to drive the lower tunnel on the Yo Tambien mine to cut the main ledge. The lower tunnel is in 400 feet. The ore is said to carry 12% copper.

### Graham County.

The Arizona M. Co. has started operations on its mines near Clifton. Additional tracks and ore cars have been put in.

J. Tanner, manager of the Santa Rosa C. Co. of Metcalf, is developing and equipping the company's mines.

### Santa Cruz County.

T. T. Harding, manager of the Gladstone M. Co., operating the Macedonia mines near Nogales, says first-class ore is being mined for shipment to El Paso, Tex. The ore is being hauled to Nogales.

### Yavapai County.

F. C. Smith, superintendent of the Socorro mine near Martinez, says arrangements are made to reopen the mine and increase developments. The mill will not be operated until sufficient development work has been done to insure a supply of ore for the mill. Fifteen men have been put on under Foreman B. Quinn.

The New Idea G. M. & M. Co. has been organized by E. Cosgrove as president, A. S. Goodell, J. Ages, W. F. Lorenz, W. R. Orr and T. N. Childers of Silver City, N. M., to develop a group of gold claims near Prescott. T. N. Childers is manager.

### Yuma County.

W. R. Russell of the Amalgamated G. M. Co., operating near Quartzsite, says the roads are in bad shape from the recent rains. A traction engine and freight wagons will be used by the company in taking out its freight. A 120-stamp mill will be built at Quartzsite. The traction outfit will consist of a 100 H. P. motor car and four 15-ton capacity freight cars. The motor car is said to generate electricity which it supplies to the other cars, and each car has its own motor.

## ARKANSAS.

### Marion County.

The Crystal M. Co. will start development of its property near the Denison mine on Crooked creek, near Dodd City. The Cincinnati Belle mine at Yellville will be reopened. The mines about Dodd City have begun shipping ore from Foster, manager of the Rising Sun mine, will resume development work.

### Searcy County.

The Excelsior mine at St. Joe is sinking a shaft on the east drill hole. Two other drill holes are being sunk.

## CALIFORNIA.

### Amador County.

W. W. Worthing, manager of the Bay State mine, north of Plymouth, says the

shaft has been sunk 200 feet to the 1000-foot level; that he is drifting north and south on two veins on the 1000 level and is keeping ten stamps dropping on rock taken out in development work. The crosscut from the shaft to the ledges on the 1000-foot level is 520 feet in length. Worthing says he will have 300 feet of backs, and that the ore being worked, though of low grade, pays for milling.

### Butte County.

The New York & California Dredging Co. has bought the Marigold dredgers and mining land 6 miles from Oroville. J. W. Goodwin of San Francisco is president of the company, and K. Krug, superintendent of the Lava Beds Dredging Co., will have charge of the New York & California's dredging operations as well. Equipment will be increased.

### Calaveras County.

(Special Correspondence).—The Melones M. Co. is dropping sixty stamps steadily on ore from the 300-foot and 400-foot levels. The open cut on the top of Carson hill is no longer being used as a source of ore. Stopping and development work are progressing underground. Preparations are being made to add forty stamps to the mill, which will make 100 stamps under one roof. When the present sixty stamps were put in foundations were provided for 120 stamps, divided into two sections, with the power plant in the center. To allow the power to be used for the additional forty stamps it is proposed to remove the two compressors from the mill. Power for the compressors will be obtained by a turbine installation, reusing the waste water from the mill turbine wheel. The cyanide plant is reported in satisfactory operation and is using the bromo-cyanide process. F. Langford is superintendent of the Melones M. Co.

Melones, Aug. 31.

Machinery for the Live Oak No. 2 M. Co. at Railroad Flat, consisting of a 10-stamp mill complete, is being put on the Swiss mine, says E. L. Holder, superintendent.

The Union C. Co. of Copperopolis is making preparations to open its mines on a larger scale and, it is reported, will build an oil tank at Milton and improve the roads between that town and the mines and put on traction engines to do its hauling. G. McM. Ross is manager. The work of removing the mill and hoist at the Marshall mine, near San Andreas, is progressing and is expected to be in running order this month. Much of the works is being rebuilt.

The Lightner M. Co. at Angels reports, including the forty-first dividend paid out last month, a total of \$212,000 paid. The directors are considering increasing the mill from forty to sixty stamps. A. Chalmers is superintendent.

### Kern County.

The closing down of oil properties at Kern river, in consequence of the Standard's cutting off the market, has begun, says the Californian. The Piedmont and the Linda Vista companies, under same management, were the first. Superintendent Saginette has received orders to shut down the wells and quit all business for an indefinite period. These companies have five wells on their properties. Orders have also been received by the Nevada County and Columbian Cos. to the effect that no oil should be shipped at the price of 11½ cents, announced by the Standard. The Columbian, it is said, has a contract with the Santa Fe for the sale of oil at a satisfactory price, so that it will not be obliged to shut down. The Potomac will shut down until the outlook improves. This company has ten wells. The Associated's offer to pay 15 cents for oil is for long-time contracts only, not for spot oil. The Standard has further announced that it will refuse to handle any Kern River oil not already contracted for, at any price, according to orders received by Superintendent Page at Bakersfield.

### Nevada County.

The hoist at the Charonnette mine, at Canada Hill, near Nevada City, has been completed and has capacity to sink to 2000 feet.

The Last Chance and Hidden Treasure mines (the Eureka drift mines) have been bonded to a Sacramento company for \$35,000. The mines will be worked by drift and a tunnel will be run. T. Carroll of Grass Valley, superintendent, will start work next week.

At the Brunswick mine at Grass Valley another ledge has been cut in the 1250-foot level. It is 8 feet wide. Work is also progressing on the 4-foot ledge on north side. The pumps are handling 60 miners' inches of water.

The tailings of the Petitjean chlorination works, below the North Star mine, near Grass Valley, are being shipped to the Selby Smelting Works.

The 4-stamp mill at the Siberian mine

at Badger hill, near North Columbia, is ready to crush ore, says Superintendent A. S. Bigelow. The Siberian has a shoot of ore tapped in a lower tunnel.

### Placer County.

Superintendent G. Foster of the Big Pine mine, near Auburn, says a mill will be built.

### Shasta County.

A Huntington mill, with a 6-foot Frue concentrator and provision made to save the tailings with a view to cyaniding them, is being put on his mine on the Shasta county side of the Deadwood divide by G. R. Simmons, of French Gulch.

The Bully Hill C. & S. Co. at De Lamar is sinking the shaft in No. 3 tunnel to 770 feet. Last year the work of sinking was stopped when the 670-foot level was reached. When the 770-foot level is reached crosscuts will be run.—H. C. McClure, owner of the McClure group of mines on Bully hill, is preparing for further work.—A few men are working on the Shasta May Blossom group of claims.

### Siskiyou County.

H. M. LeBaron of Valley Ford, Sonoma county, part owner of the Gold Dike M. & M. Co., operating in the Salmon river district, says a milling plant with a capacity for handling 30 tons of ore daily will be built at the mine. Preparations are being made for increased development.

Yreka reports say Phillips & Harrison, developing a mine on the Deadwood, uncovered a pocket last week from which they took out \$500.—The Fernandez hydraulic mine, on Cherry creek, has made its season's clean-up, from which \$5000 was realized. C. Paige of San Francisco has an option on the mine for thirty days for \$25,000.

The Mount Vernon mine on divide between Greenhorn and Cherry creeks, south of Yreka, reports taking out payable quartz. The saw mill is cutting lumber for the mine. The foundation for the 10-stamp mill is ready for erection of frame work and putting in machinery. The Cherry Hill mine is on same lode down Cherry creek.

The Morrison & Carlock mine at Quartz valley, near Fort Jones, continues to yield values. A 10-stamp mill is about completed in place of the 5-stamp mill and an air-compressing plant is being put in, all run by steam power. About fifty men are at work.—Superintendent Bryant at Deadwood has men at work putting up a quartz mill on his mine.

T. J. Nilton, superintendent of the Minetti B. hydraulic mine at Nilton, reports an \$1800 cleanup, the product of thirty days' mining and made since the other mines on the river have closed for the season. In addition to the cleanup from the sluice boxes Nilton reports \$1000 remaining in low places on bedrock, too low to be bottomed by the present line of sluice boxes, and that the gold will be taken out by shoveling into a short line of boxes.

### Trinity County.

A cyanide plant will be built at the Yellow Rose mine, on the headwaters of Coffee creek, near Dedrick, says Superintendent J. C. Boddiker. A working tunnel on a level with the Yellow Rose mill—a 4-foot Huntington—was being run when a ledge 10 feet wide on the average was cut. This ledge was not found in the upper workings of the mine, and assays \$8 free gold, with sulphurets. In the upper workings the ledge runs 1 foot in width and carries free gold. The working tunnel being run is to tap that ledge at a depth of 340 feet below the upper workings. On account of the expense of pumping and mining in the upper workings of the Yellow Rose, the work of taking out ore was discontinued and the mill closed down. There are six men on development work.

Further improvements are planned by the Dorleska M. Co., operating the Dorleska mine, on Union creek, near the head of Coffee creek, near Dedrick. The company proposes to install an electrical generating plant on Union creek to furnish power and lights for the operation of the Dorleska mine and mill. Considerable preparatory work must be done, such as building dams, ditches and flumes. The mine and 10-stamp mill are in full operation and sixteen men are on the payroll. H. Z. Osborne of Los Angeles, Cal., is president and manager.

P. Bouery, manager of the La Grange hydraulic mine near Weaverville, says the reports that the entire flume will be rebuilt are in error, for it does not need rebuilding. The company will increase its water supply.

### Tuolumne County.

At the Hy-a-poo mine on South Fork of Stanislaus river, 3 miles northeast from Columbia, a gravity tramway has been built, 1200 feet in length, on the south side to the bridge at the river. A ¾-inch steel cable operates the trolley that conveys supplies, timber, etc., to the river

where are located buildings and air compressor. A flume, 3000 feet in length, carries 600 inches of water, giving with a low head 80 H. P. for the air compressor. Eventually the quartz will be sent down to the proposed millsite at the river, says Superintendent R. Fulcher.

It is reported the Sullivan mine near Black Oak mine, near Soulsbyville, will be again started up by J. Mason, of San Francisco.

The Confidence mine and mill at Confidence are again in full operation. Over seventy-five men are employed. N. Carmichael is superintendent.

E. J. Olsen, superintendent at the Star mine, near Columbia, says he will put in a compressor and the mine will be further developed.

## COLORADO.

(Special Correspondence).—The fact that in Denver the American Mining Congress will establish permanent headquarters is learned with much satisfaction.

The report that the Guggenheims had an option and secured a lease on the Smuggler-Union mine at Telluride is denied by the management, it being impossible to sell or lease to them on account of several outstanding leases to other parties.

A serious accident was averted at the Portland mine, at Victor, the past week, when the cage was drawn into the sheave wheel, but owing to safety devices the cage did not drop back into the shaft.

Governor Peabody has issued a proclamation designating Sept. 5th as labor day for Colorado. It is understood that labor organizations from different parts of the State will participate in the parade at Denver simply to show their strength.

The several letters written by Walter Wellman, the newspaper correspondent, on the labor conditions in Colorado, have brought forth severe criticism from people who are unable to look at the situation as he did. It is understood he came here prejudiced in favor of the Federation of Miners, but before leaving had changed his mind.

The past week has seen several deportations from the Cripple Creek district by an organized mob. It was stated during the early part of this week that troops would again be sent to the district, but the sheriff of the county claims he is able to handle the situation without the troops. Several of the most prominent citizens of the district have been arrested and released on bonds for participating in the recent deportations.

Reports from different parts of the State indicate that the mining industry is improving each week.

Denver, Aug. 29.

### Chaffee County.

Buena Vista reports say near timber line on Mount Princeton, Shephard of Leadville is driving the Latchaw tunnel to cut the Dandy Butler vein. The work is under supervision of C. I. N. Sharpe. Already the tunnel has cut several small veins. New pipe and machinery have been put in at the power house and mine. As soon as the vein is cut the company will erect a mill.

The Washington mine on Yankee Blade hill, ½ mile northeast of Granite, operated under lease by Martin brothers, is working two shifts and keeping its mill running steadily. The ore is milling \$16 per ton. The miners are working in 6 feet of free milling ore.

The Saguache Hydraulic M. Co., operating the Ball placer on Lake creek, near Granite, is placing its machinery and will be ready to start operations this winter. It is prospecting its ground by drifts and has two Keystone drills running. Drift mining is under way. Two dredges are nearly completed.

### Clear Creek County.

At the Kemp-Calhoun mine in Leavenworth gulch, near Central City, machinery has been put in and they are hoisting water. The main shaft is down 430 feet. The mine is owned by J. Kemp of Boulder.

The Black Lion Con. G. M. & T. Co. has been incorporated by W. McEniry, president and treasurer, Rock Island, Ill.; J. S. Burns, A. L. Laycock, J. W. Jacques, managing director, Idaho Springs, and R. D. McCreery, C. Dye, directors. The company was organized to take over the holdings of the Black Lion M. Co. and adjoining claims in the Ute creek section, near Idaho Springs, and has a group of lodes, which will be opened at depth by driving a crosscut tunnel. In the group are the Big Flat and the Black Lion lodes.—Hickson & Co., having a lease on Block No. 10 in the sixth level, east on the Edgar mine, are shipping concentrates and smelting ore.—Another battery of ten rapid-drop stamps is being added to the Ward mill on Jackson bar which will give the capacity of the mill sixty tons daily. Grading out below the mill for the cyanide section is finished and the steel tanks are on the ground. The

shaft on the Ward mine is down 140 feet and a crosscut is being driven to reach the hanging wall and the shaft is getting water. A pump will be installed before sinking is resumed.

J. T. Johnson of Denver, manager of the Arapahoe group of claims in the Argentine district, says the Arapahoe group is being developed by a crosscut tunnel which is showing silver and lead ore. Another tunnel will be started to cut the vein lower down. Machine drills will be used.

Machinery is being put in at the mines of the East Argentine M. Co. near Georgetown, says Manager Sidney. The Sidney tunnel will be driven with power drills.

Work of driving the Empire tunnel, near Georgetown, was resumed this week. Shipments of milling and smelting ore are being continued from the Gold Dirt and Tenth Legion properties of the company.

Work will be started this week on the new tunnel of the St. Paul M. Co., near Georgetown. A power plant will be put in before stormy weather sets in and machine drills will be used, says Manager Teagarden.

#### Dolores County.

(Special Correspondence). — The Durango Leasing Co. is operating on the dump of the Enterprise Lease and also operating in the old stopes and low-grade veins in the mine. This property is on Enterprise hill and is equipped with a 100-ton mill. The mill has been overhauled and put in shape to treat the ore. In the mill they use crusher, rolls, Huntington mill and ten Wilfleys. The power consists of two 80 H. P. boilers and 100 H. P. engine. They have recently added water power which can be used for several months during the year. C. D. Hopper is manager and J. Krantz mine superintendent.

The San Juan Ore Co. is working the Pro Patria mine and mill. They have added magnetic separators to the mill which are said to be satisfactory work. S. W. Osgood and W. C. Brace are consulting engineers and R. Lyman, Jr., manager of the company.

Rico, Aug. 28.

(Special Correspondence). — R. Keller, manager of the Emma Gold M. Co., is doing considerable development work blocking out large bodies of ore preparatory to doubling the capacity of his mill. The main tunnel is 3000 feet in length on the vein. They have 5 feet of ore that averages \$15. The mill is handling about forty tons per day. They have started a second tunnel 300 feet above the other one to block out a piece of ground 300 feet by 1500 feet which will give them ample working ground. They are also shipping some high-grade ore.

Dunton, Aug. 29.

#### Fremont County.

T. G. McCarthy, part owner of the Rocky Mountain S. Co., in Florence, says the company intends to repair and again operate the smelter.

#### Gilpin County.

The Con. Investment Co. is operating the Vassar group in Graham gulch. The main tunnel has been driven 650 feet. The ore contains copper-iron sulphides carrying gold values. C. B. Rhodes of Kansas City, Mo., president and manager, says he will arrange to install an electric plant for development of the group, which will include drills, power and lighting.

Operations have been resumed at the Gauntlet mine, on Quartz hill, in Illinois-Central district, near Central City, which is owned by Iowa men and under the management of L. D. Hobson. Arrangements are made to sink the main shaft 200 feet more. Its depth is 400 feet. Stopping operations are being carried on at a depth of 375 feet.

At the Lutz mine, near Russell Gulch, operated under lease and bond by G. K. Kimball Jr. of Idaho Springs, the workings are being unwatered and retimbered. The shaft is down 530 feet. Work is being done by Superintendent J. H. Bawden.

The Cashier G. M. & R. Co. will this month put in a 60 H. P. hoisting engine and make additions to its shaft building on the Pittsburg mine. Arrangements are being made to sink the main shaft, now 600 feet deep, 200 feet more. The company has forty men working on company and leasing account, the company working the 500-foot and 600-foot levels, while all work above the fifth level is being done by leasers. B. L. Campbell is superintendent.

H. Butler and G. W. Thatcher of Denver, owning the Tigress group of claims, in Illinois-Central district, near Central City, have resumed development and will put in a steam hoisting plant. — H. Stevens and J. Jones of Russell Gulch have started work on the Perrin mine, between the Topeka and Hillhouse mines, in Russell district. They are repairing the shaft and expect to take out free milling ores.

#### Gunnison County.

The Golden Eyelet group, near Pitkin, has been sold to a Kansas City, Mo., company under management of G. Brant of Pitkin. He is increasing development, also building a concentrator to handle entire ore production.

The Farley group of mining claims in the Gold Brick district, near Pitkin, has been sold to G. Brant et al. The Farley group is near the Golden Islet mine, which is operated by Brant.

#### Hinsdale County.

At Burrows Park, near Lake City, are three groups of mines under development — in American basin the Oneida and Gnome mines, the first named owned by J. H. Sloan.

At the Contention mine near Lake City last week connections were made between the Mayflower tunnel and the old workings of the mine, says Engineer W. B. Colwell. The ore continues to hold out, says Manager Kazar, and the mill has been started.

#### Lake County.

On Sugar Loaf mountain, near Leadville, development of the Dinero vein will be resumed, says the Leadville Herald-Democrat. A. H. Boyd will resume work on the Fanchon G. M. Co. mines. The Fanchon shaft was sunk to 245 feet last year. The shaft struck the apex of the Dinero vein. A hoisting plant is on the ground, but other machinery is being added, including an air compressor and machine drills. It is intended to sink the shaft to 450 feet.

#### La Plata County.

(Special Correspondence). — The Small Hopes mine, on Small Hopes mountain, about 3 miles north of La Plata City, is being operated by the Empire Gold Mines Co. The main tunnel is in 550 feet and still driving. They are doing only development work and have opened up ore west of the tunnel which runs from \$20 to \$57 per ton, but has not been developed enough to know how much they have. The object of the tunnel is to cut the Small Hopes vein, and will cut several smaller ones as the tunnel progresses. The ore is telluride carrying gold. The property consists of twenty-nine patented claims and is equipped with air compressor, power drills and other machinery. W. R. Price is superintendent and manager.

About 1 mile above La Plata is the property of the Bonnie Girl M. & M. Co. The company is getting its mill ready to receive machinery. The mill will contain, when completed, fifty stamps and other machinery, besides cyanide process. A pipe line and flume has been built to carry water to the mill for power purposes. This property is also known as the Baker Contact and has a small testing mill on the ground containing ten stamps. The company owns 426 acres in placer and lode claims. An aerial tramway 5000 feet in length leads from the mine to the mill. A. H. Phelps is manager.

On the Comstock mine operations will begin Sept. 1st. The property has one shaft 160 feet deep and vein averages about 4 feet wide, of \$20 per ton value. The mine is owned by Calumet, Mich., parties and it is their intention to increase development work under Superintendent J. B. Truitt.

H. C. Deming, acting geologist of Pennsylvania, has charge of the Boren Gulch M. Co. property and is doing development work. They have gold, silver and copper ore in paying quantities, and have ore on the dump ready to ship.

La Plata, Aug. 28.

(Special Correspondence). — Four miles south from La Plata is the May Day Gold M. & M. Co. At the base of the hill on which the mine is located they have a power plant on La Plata river. Boiler and 4-drill compressor comprise the plant. The company has a shaft down 150 feet and a tunnel in 625 feet. The ore is packed to the bottom of the hill and then hauled by wagon to Hesperus. T. Kelly is superintendent.

Hesperus, Aug. 28.

#### Larimer County.

P. J. Moynahan and J. Hahn of Cripple Creek have leased the Empire copper mine, 10 miles northwest of Fort Collins, and will increase equipment and development.

#### Ouray County.

The Tempest-Apex M. Co.'s mine and mill, near Ouray, are running full handed. The mill is handling twenty tons of Tempest ore per day and turning out concentrates assaying \$70. Development is also in progress. Manager F. M. Jackson says the Breen crosscut, which is 2000 feet long, is being extended and within 300 to 500 feet will cut the Consort vein at a depth of 1500 feet.

#### San Juan County.

D. B. Smith is working men on his

Silver Queen mine, 3 miles from Animas Forks, near Silverton, stripping the vein and leaving the ore for future extraction. By spring sufficient ore will be in sight to warrant starting the mill.

The Ruby Basin M. & M. Co., near Silverton, is building a concentrating plant. The mill is expected to be running Nov. 10th. Underground work in the tunnel and veins intersected consists in retimbering and development.

#### San Miguel County.

At the Alta mines, in Gold King basin, near Telluride, the 20-stamp mill is turning out average of two carloads of concentrates daily. High grade ore is also being shipped to the smelters. — Development at the mines of the Ophir Con. M. Co., at Ophir, continues. Three levels are being opened on the Ida vein, and the pay streak is 6 feet wide, of free milling gold ore. In those levels the Butler vein has also been cut. Thirty stamps of the mill are crushing Ida ore. The major portion of values are recovered on plates by amalgamation. — For several months the Tomboy and Liberty Bell companies, at Telluride, have been operating with reduced number of miners. The Tomboy company's 60-stamp mill has been treating 200 tons of mineral per day (the other mill being idle). The Liberty Bell is increasing output and has eighty stamps dropping.

#### Summit County.

Breckenridge reports say in Blue River district the Quandary Mountain M. & M. Co. has its concentration mill running on ore from blanket vein of the Monte Cristo mine, one of the group owned by the company, on Mount Quandary. The ore is quarried. Additional concentrating tables are being put in. — The Hoosier Gulch M. Co. is working the Bemrose placers with satisfactory results. A double compartment shaft has been started on one of the iron veins of the lode included in the group. It will be put down 200 feet. Machinery will be put in. The property is 12 miles south of Breckenridge on Hoosier pass. W. Bemrose is manager. — The Senator G. M. and M. Co., operating a group of gold bearing lodes on Star mountain, in Blue River district, is having main lower tunnel driven by contract 600 feet more. A compressor and air drill plant have been placed near mouth of tunnel.

#### Teller County.

Manager Franklin of the Eagle sampler, at Cripple Creek, has completed installation of a plant of machinery. The crusher has a capacity of 60 tons per hour. The sampler has had 30 men at work, which number will be increased.

Several plants of machinery are being installed at Cripple Creek mines. The Granite mine on Battle mountain is putting in a fifteen-drill air compressor and a 150 H. P. boiler. The mine's tonnage will be increased to 1000 tons a month. Lessee Shreeder, operating on the Golden Cycle on Bull hill, is putting in a hoist, engine and boiler and expects to start development work next week. — Russell & Sharpe have put in two compressors, one on the Lonaconing property on Beacon hill, another with a hoist on the Colorado Boss on Raven hill. Another Beacon hill lessee who will install machinery is Manager Burke on the Henry Adney, which adjoins the Lonaconing.

The El Paso Gold King, up Poverty gulch, on Womack hill, Cripple Creek, is producing one car of ore per day running \$25 in gold per ton. The ore is being broken down on the 900-foot level and fifty men are employed.

The cyanide plant of the Brotherhood G. M. Co., north of Gillett, has been put in operation. It has capacity to treat fifty tons of ore daily. The ore is oxidized and is taken from the shaft sunk 500 feet. Assays give \$4 in gold.

Superintendent Murray of the Peggy G. M. Co., operating under lease on the Mabel M. property, on Beacon hill, Cripple Creek, reports opening up ore. The leasing company has 5 feet of ore, from which the screenings are returning \$60 per ton. — In the 325-foot level of the W. P. H. mine of the United G. M. Co., on Ironclad hill, Cripple Creek, Lessee Seaver & Harrison are breaking 18 feet of ore. One-half of the rock broken is making screenings that give returns of \$100 per ton. The coarse ore shipped bears two ounces per ton.

Cripple Creek reports say it is proposed to consolidate the Findley G. M. Co. with the Valley City G. M. Co. The Findley company owns the Findley claim, estimated value \$625,000, on Bull hill. The Valley City G. M. Co. owns the Shurtloff No. 2, the Happy Thought and a fraction of the Pauper claim, having a total estimated value of \$625,000. The property adjoins the Findley on Bull hill. The name of the new company will be the Findley Con. M. Co., and its principal office will be in Cripple Creek.

The cyanide mill of the Anaconda mine

on Gold hill, Cripple Creek, is nearing completion. The mill will start with capacity of 100 tons daily. King & Craig have a lease on certain blocks of ground and will also treat the dumps. It is expected to start the mill next week. — Lessee W. J. Merrifield, working the dumps of the Stratton's Independence, Ltd., is putting in another ore washer. Merrifield is shipping from the other dumps. He will put in additional equipment.

#### IDAHO.

##### Elmore County.

F. J. Conroy, at Atlanta, manager of the New Century E. & I. Co., says he is putting in a 50-ton mill. A road was built 16 miles. The ore values are in free gold. It is intended to have the mill in operation by October 1.

##### Idaho County.

W. B. Moore of Walla Walla, Wash., part owner of the Wisdom and Big Dipper mines, adjoining the Sunnyside mine, Thunder mountain, says he will put in a mill.

##### Lemhi County.

H. Harker of Salt Lake City, Utah, manager of the Gold Dust mines at Leesburg, reports the stamp mill completed and in operation.

At the Copper Queen mine near Salmon City, leased by T. and H. Poindexter and T. Haw, the lessees have increased development work and have completed a 5-stamp concentrating mill. The ore is said to assay 9% copper and \$6 gold.

##### Shoshone County.

The Tamarack & Chesapeake M. Co. will ship ore from its mines below the Custer mine, near Wallace, under management of D. H. Brien. The main tunnel is in 1250 feet and showing lead values in carbonates and galena.

The total production of shipping ore and concentrates of the Cœur d'Alene mines for the first six months of 1904, as estimated by the railroads operating in the district, was 114,442 tons, an increase of 15,411 tons over the corresponding period of 1903. The estimate of the mine managers showed a difference, in the estimate of the railroads, of but 247 tons. It is expected the total production for 1904 will reach 245,000 tons.

#### MONTANA.

##### Fergus County.

G. H. Stanton and H. Armstrong, of Great Falls, have a bond and will develop the Handicap mine, adjoining the Barnes-King property at Kendall. A diamond drill will be put to work. A company will be organized for development work and a 100-ton mill will be built.

A 200-ton tank has been added to the Barnes-King mill in Kendall. The Barnes-King group is being prospected with diamond drills.

##### Madison County.

The Conroy Placer M. Co. at Ruby, N. S. Shaler, president, proposes to build a third dredge, to be finished for running next season, equipped with electric motors. Electric power will be obtained from the power plant of the Bismarck-Nugget Gulch Co. near Sheridan, or generated in an engine-driven power plant to be built at Alder. It is thought the third dredge will be constructed on nearly the same plans as dredge No. 2.

#### NEVADA.

##### Elko County.

S. Newhouse of Salt Lake City, Utah, has bought the Greenback mine at Mountain City for \$40,000, and will resume working the silver-bearing lodes. M. M. Johnson for Newhouse has begun work on the Kunz group, which joins the Nelson mine. Johnson has also a bond and option on the Mountain City mine and has begun development with fifteen men.

##### Esmeralda County.

High-grade ore is reported struck in the Sandstorm mine, 1 mile north of Goldfield, owned by T. L. Oddie et al. The Sandstorm is between the Kruger and the Stimler claims and M. J. Gardner is superintendent. A stampede to the district is under way from other Nevada camps.

##### Eureka County.

The West M. Co. of Salt Lake City, Utah, operating iron properties near Palisade, is shipping 130 tons of iron ore daily to the American smelter in Salt Lake valley, where it is used for fluxing purposes. R. Watson of Salt Lake City is superintendent. Output will be increased.

##### Humboldt County.

(Special Correspondence). — The Pine Forest Gold Co., J. H. Ashdown of Denio, Or., president and manager, is developing a group in Humboldt county, about 15 miles south of the Oregon line, south of Denio, Or., and on the west slope of the

Pine Forest range of mountains. The ore is free-milling gold, soft and easily reduced. The veins are in granite and porphyry, the prevailing formation of the district. At a depth of 700 feet they have cut a body of ore which carries satisfactory values. The present plant is of twenty tons capacity, and work is being pushed on the lower crosscut, at the portal of which a 100-ton plant will be erected in the spring. This will give a depth on the dip of the vein of 1100 feet.

The Vicksburg-Denio G. Co. and Kentucky M., M. & Dev. Co. are also operating in the same camp, both of which have promising prospects and surface indications.

Denio, Or., Aug. 29.

Lincoln County.

Manager F. J. Spare, of the Pompeii M. Co., near Searchlight, says ore bodies are being opened up on the second and third levels. Hoisting is done by a whim, but when the present work on the third level is completed a gasoline hoist and a pump will be put in and sinking resumed.

The Cyrus Noble mine at Searchlight has resumed operations. Manager G. E. Otis of Redlands, Cal., says the company will make a practical test of the property before erecting a plant of its own, and with this end in view has secured a lease on the Duplex mill, which will be started this week.

C. McWerthy and J. T. Chiblers of Los Vegas report opening up free gold-bearing quartz on their Moonlight group of claims, 28 miles south of Los Vegas. They have five claims near the Colorado river, 6 miles from Salt Springs, and have water for milling ore, and as soon as the road is completed to Los Vegas will put up a hoist.

Nye County.

Oddie & Overbury, contractors building the water works system for Tonopah, have given a bond to have the water piped to Tonopah and ready for distribution by December 1st. A reservoir will be built at Mount Ararat and the water will come from Rye Patch, 15 miles from Tonopah. The engines will have pumping capacity of 1,000,000 gallons per day.

Manager O. K. Reed of Reveille says he is putting on more men in the Last Chance mine and is opening bodies of lead ore. The wagon road to Tonopah from Reveille is finished, and is 55 miles long. Eight teams are hauling ore to Tonopah at \$15 a ton, and the same rate is paid on back freight.

White Pine County.

It is reported the Eureka & Palisade Railroad, running between Palisade on the line of the Southern Pacific Co. to Eureka, is to be extended to Ely. Surveyors are at work in the field between Eureka and Ely. The work, it is understood, is being done under the direction of the White Pine Co. M. L. Regua president. He is also president of the Eureka & Palisade Co. This is said to be due to the copper company having opened up a body of ore and that the road is to be extended to afford a more economical method of handling the ore. In the event that the line is extended, it will result in opening up other mines.

The Conklin-Kunze holdings in the Dolores Turquoise & G. M. Co. at Ray have been sold to L. G. Wheeler and Chicago, Ill., and Milwaukee, Wis., men. The group comprises six claims adjoining the Ray Con. on the north and east and the Mogul on the southwest. The turquoise discovery was made on the Gold Crown claim at a depth of 10 feet. A number of the gems have been cut. The company also has a ledge 4 feet in width carrying values in gold and silver.

J. A. Black of Salt Lake City, Utah, says he has an option on the Mayflower group, between Cherry Creek and Ely, on which he will begin development this month.—At the Star and Grey Eagle mines at Cherry Creek, owned by the Glasgow & Western Exploration Co., the hoist has been put in operation. The hoist has a capacity for a depth of 1000 feet. J. Farren is superintendent. The mill will be started this month, the product to go to the company's furnaces at Golconda. At the reduction works in Golconda, Manager O. Stalman reports the electrical separators giving satisfactory results.

NEW MEXICO.

Luna County.

Site has been surveyed for the smelter of the Luna Lead Co., near Cooke, and the work of construction will be started this week. W. Clubb of Alma, Mich., will superintend the company's mines in the Cooke Peak district.

San Juan County.

Due to requirements of the low-grade mines of New Mexico and of Arizona for coal and coke at a low price, the Southern Pacific Railway Co. will build a line from

Clifton, Ariz., through the northern part of New Mexico to Durango, Colo. The branch will connect at Clifton with the Arizona & New Mexico Railway, owned by the Southern Pacific. The road will give the coal mines of the southern part of the Territory another outlet to El Paso, Galveston and New Orleans.

OREGON.

Baker County.

East of the Morning Star group in Mormon Basin, near Huntington, is the Summit M. Co., five claims and a mill site on South Dixie creek. The company is composed of Oregon City men, and P. G. Wells is superintendent. Wells says over 600 feet of tunnel work have been completed and a mill will be erected.—The Commercial M. Co., of Portland men, which owns the Commercial group, on the Mormon Basin side of the divide, 1 mile east of the Morning Star, is building a mill, says Manager W. E. King.

The Golden Gate mill, near Huntington, is crushing steadily. The plant is 3 miles down South Dixie creek from the Morning Star, and is owned by R. G. Dunn of Salt Lake City, Utah, and M. Connelly of Mormon Basin.—The Colts Co. will start its mill on the Humboldt group, which adjoins the Tabell property.—The Uncle Sam M. & M. Co., of Michigan, owns nine claims near the Morning Star, and will sink the shaft 300 feet, which is down 85 feet. It will also build a 20-stamp mill, says President J. Newbury.

Sumpter reports say McEwan, Arthur & McEwan, of Sumpter, for the Imperial M. & Dev. Co., composed of Detroit, Mich., men, has a bond and lease on the Imperial mine in Cable Cove district and expect to put in a small concentration plant, besides which ore will be shipped to the smelter. So far 4000 feet of work has been done in the development of the mine, the most important of which consists of a 1200-foot tunnel on the vein, and a new tunnel is to be driven on the vein at a point 400 feet lower. The richest of the galena will be sacked for shipment, while the second class will be piled on the dump to be treated by the new mill as soon as ready.

M. E. Bain, manager of the Overland group of claims in Cable Cove district, near Sumpter, will place 500 feet of air piping in the main tunnel. Ore is being sacked and shipped.

Grant County.

The Badger M. Co. at Susanville is putting ten stamps in its concentrating mill to work ore from the Bull of the Woods, an adjoining mine which it owns. The Bull of the Woods is opened by a shaft 250 feet deep. Ore is also sacked and shipped to the smelter. The company is installing an air compressor plant to be run by the water furnishing power for the mill. A flume and a ditch are nearly completed, which will convey the water 1/2 mile to a point where enough fall will be obtained to run compressor. The air will be piped back to the mine to run hoist and drills.

Jackson County.

Superintendent T. Kahler, at Tolo, says he will superintend prospect work for Ray & Co. on the McDonough place. An ancient channel of Willow creek runs through the land and is said to be payable placer ground. Should there be gold sufficient to justify, Ray will put in a dredger similar to that operated on Foothills creek by Champlain & Co. If there is not sufficient water caught in the basin to float the dredger and wash the gravel in the sluice boxes on the scow, water from Rogue river will be pumped to the basin.

Josephine County.

Grants Pass reports say 4 feet of ore running \$40 per ton is being opened at the Golden Wedge mine of Galice district, owned by G. W. Kirkley of Wilmington, Del., and W. J. Cleland of Philadelphia, Pa. Drifting on the vein is being done at the 300-foot level. A tunnel is being driven to cut the ledge 150 feet below the shaft. They will increase the mill battery to twenty stamps and add other equipment, including an electric lighting and power plant. Water power will generate the electricity and electric drills will be used underground. A sawmill will be built.

At Takilma the smelter is completed and will be blown in this week. The smelter has a capacity of 100 tons of ore per day. Three engines will supply power for the ore crusher, dynamo, blower, elevator, etc., and water for the boilers and for the smelter will be supplied by a 6-inch pipe under 160-foot pressure. Charcoal and coke will be used for fuel. The company is having charcoal burned on its timber land near the smelter. The coke will be hauled from Grants Pass—42 miles—by wagon. These teams will haul out copper matte. Bins at the smelter are filled with ore and 2000 tons are on the dump at the mine. The company expects

to put in a railroad to connect the mine with the smelter, and it is expected that next year a railroad will be built from Grants Pass to Takilma and on to the ocean at Crescent City, Cal. C. L. Tutt of Colorado City, Colo., is president of the United States R. & R. Co., owning the Takilma smelter.

Machinery is being put in at the Hamersley mine, in the Jump-off Joe district, near Grants Pass, including a boiler and 5-stamp mill.—The Albright mines on Rancheria creek, near Kerby, have been bonded to T. F. Hopkins et al. for \$20,000. The ore is of low grade. They intend to put in a mill of 100 stamps.

The Golden Drift M. Co., operating 5 miles from Grants Pass, on the Dry Diggings group, on Rogue river, has put in five 400 H. P. turbines. The power is to be connected with a single shaft and will be used in the operation of a centrifugal pump which has a capacity of 9000 gallons of water per minute under a 430-foot head. The dam is being built to accommodate eleven more of the turbines. There are fifty men employed at the dam. The Golden Drift Co. bought this property from H. A. Corliss three years ago for \$15,000. This year their cleanup was in the neighborhood of \$20,000, and it has never fallen below the purchase price equivalent in either year of operation since.—J. M. Layman, superintendent of the Lewis and Clarke mine on Canyon creek, reports taking out telluride ore.

Manager Kirkley of the Golden Wedge quartz mine, near Merlin, says a reduction plant will be built.

Lane County.

The Great Northern Dev. Co. has been incorporated by W. S. Standish, H. C. Mahon and A. O. Waller, principal place of business at Eugene, to develop the Great Northern mine, in Blue River district. A 2-stamp mill has been in operation on the mine for several months, turning out \$2500 in bullion per month. A Huntington mill will be added to the equipment. Two concentrators will be put in to save the sulphurets, said to assay \$100. An overhead tramway, 1000 feet long, will be built. The mine is bonded to the company for \$50,000.

Marion County.

The Ogle Creek M. Co. has struck a ledge 8 feet wide in its mine on Ogle creek, where it has been sinking shafts and driving tunnels, says J. V. Harless, of Molalla, part owner. Harless et al are also doing development work on Henline creek, a tributary of the Santiam river, 3 miles from Ogle creek. There are no wagon roads to those mining sections, and Harless states they have let contracts to pack in 7000 pounds of supplies and steel.

SOUTH DAKOTA.

Custer County.

The Custer Chronicle reports the Leroy M. Co. will resume work on its mines near Custer.

A 10-stamp mill is being built by the Ruberta M. Co., near Custer, to have cyanide tanks in connection.

Lawrence County.

C. Y. Smith of Lincoln, Neb., president of the Gold Eagle M. Co., says development work has shown ore in both the Archean and Cambrian formations. The principal showing is in the quartzite, which is 30 feet thick and heavily mineralized, carrying gold and silver values. As soon as sufficient ore is blocked out a mill will be built. The company owns eighty-five acres of mineral land adjoining the Penobscot group (Alexander Maitland M. Co.) at Maitland.

The Capital G. M. & M. Co. will develop its group at Texana station, along Deadwood gulch, 5 miles westerly from Deadwood. The openings consist of several tunnels, from which winzes have been sunk. A shaft will be started on one of the principal veins on Middle Fork of Deadwood creek. A whim will be used to depth of 75 feet, when a steam hoist will be put on. The formation is slate and schist cut by porphyry dikes. The Capital holdings are near the Golden Reward and the Horseshoe mines. R. W. McGinnis of Lincoln, Neb., is president, and A. H. Simpson of Deadwood vice-president.

G. L. Allen, of Hamburg, Iowa, president of the Big Four M. Co., is resuming work on the company's mines near Deadwood. The Big Four shaft is 175 feet deep, and it is intended to continue to 500 feet. The shaft is equipped with machinery, taking the place of the plant destroyed by fire last winter.

Crosscutting has started from bottom of shaft of the Minnesota M. Co. at Maitland. The shaft has been sunk to quartzite. The company will build a reduction plant. F. E. Little, of Minneapolis, Minn., is president.

J. G. La Sarre, of Chicago, Ill., is opening up the Lida group of Box Elder creek

near Greenwood, owned by A. W. Coe et al., of Deadwood.

The Star group of mining claims along the Spearfish canyon, near Maurice station, west of Lead, has been sold to the Victoria G. M. Co. There are in the group 100 acres. There are bodies of cyaniding ore, much of which may be mined by quarrying. Last spring the company bought the Spearfish group, consisting of sixty acres. The Victoria G. M. Co. is arranging to build a dry crushing cyanide plant in the Ragged Top country. J. Hartgering, of Deadwood, is interested.

It is reported the Golden Crest M. Co. is preparing to resume operations during September. R. L. Bailie, of Detroit, Mich., is president of the company. The Golden Crest Co. owns a group on Two Bit gulch, 4 miles from Deadwood, and has a 10-stamp wet crushing cyanide plant.

Last week forty tons of tin concentrates were shipped to Wales from the Tinton Tin Co. mine at Tinton, in the Bear Gulch district, being the second shipment from that mine to Wales. One of the largest veins in the Black Hills that carries tin minerals is found in the Tinton group. It is 50 feet in width.

W. E. Fritts of Chicago, Ill., part owner of the Bear Gulch G. M. & M. Co., operating in Bear gulch section, near Tinton, says development work is being increased and ore bodies are being opened. In addition to its gold holdings the company owns the tin properties formerly of the Niagara Tin Co.

Manager E. P. Farnham of the Queen of the Hills G. M. Co., operating 1 mile from Deadwood, says development work will be continued until sufficient ore is blocked to justify building a mill. The company owns water rights which will supply a 100-ton mill.

The Reliance G. M. Co., F. W. Medbery of Deadwood manager, has begun ore shipments and is preparing to build a mill and cyanide plant at its mine.

Pennington County.

The Canton G. M. Co., operating near Hill City, proposes building a mill at its property.

H. Von Gunter of Findlay, Ohio, of the Grand G. M. Co., operating on Burnt Fork creek, near Hill City, reports they suspended operations on the property last month owing to more water than could be bailed. A larger hoist with pumps is to be put in and work will be resumed. The main opening is a shaft 60 feet deep following a ledge of ore with a width of 4 feet.

The Dakota-Calumet C. M. Co. is sinking a shaft on its group near Hill City, for development of its copper veins. The company's 100-ton smelter is completed.

The Empire State M. Co. has unwatered the Golden Slipper mine near Hill City and operations will be resumed. It has been working the Golden Slipper several years, under lease and bond.

UTAH.

Beaver County.

Work is progressing in the Reciprocity mine near Frisco. In the development of the Reciprocity, which adjoins the holdings of the Imperial Co., a tunnel has been driven following a vein. A winze has been sunk and an ore body 8 inches wide opened showing galena with value of \$25 per ton. The Reciprocity group is near the Horn Silver mine.

Box Elder County.

H. R. Ellis of Salt Lake City reports making experimental tests on ores of the Sunrise mine of Park valley, preparatory to mill construction.

Cache County.

La Plata M. Co. reports progress in the development of its group at La Plata near Ogden. A tunnel has been driven 1200 feet and has vertical depth of 900 feet. J. Heid, treasurer of the company, says a mill will be built.

Grand County.

Near Basin, in La Sal mountains, arrangements will be made by the Welsh-Lofftus Rare Metals Co. of Niagara, N. Y., for building a plant in the Grand river, for reduction of the ores of the Welsh-Lofftus uranium-radium mines. J. H. Lofftus, who has charge of the property, has started operations. Copper values are being obtained in the ore. The plant will be located at the new townsite of Radium, where water power is afforded.

—Wolf Bros. of the Skylark Co. are preparing to start systematical operations on the Skylark property, on Mineral mountain, near Basin. With their recent acquisitions of property near the Skylark, they are able to start work whereby they can tunnel into Mineral mountain on one of its largest veins and drift toward the Skylark vein, says E. Wolf, manager.

The American Asphalt Association, near Moab, reports increasing output on its Norville mine, and thirty-four four and six-horse teams are hauling the product to Fruita, over the Utah line in Colo-

rado. The freighters receive \$14 a ton and more teams are being put on.

#### Iron County.

At the Johnny mine at Stateline, Superintendent R. Francis reports opening additional ore bodies. The 10-stamp mill will be started next week, and ten more stamps will be put into the mill. F. Wilson of Salt Lake City is manager.

#### Juab County.

The Mammoth M. Co. at Eureka expects the output for August to reach \$100,000, particularly as reports from the mine show the high-grade ore bodies are increasing, says Superintendent S. McIntyre, Jr. The total operating expenses run from \$10,000 to \$13,000 per month, as 130 men are employed. On the 1900-foot level a body of quartz running 9 ounces in gold per ton is being opened up. On the 800-foot level a donkey hoist has just been set up to facilitate sinking in the lead-silver vein.

The Grand Central M. Co. at Eureka has made preparations to go deeper. The air compressor plant has had its capacity doubled, and the hoisting machinery has been placed in first-class trim. During the period of new development the output of the mine will be decreased, as sinking the shaft will interfere in ore raising.

#### Plata County.

P. W. Madsen of Salt Lake City says at the Trapper's Pride mine on Gold Mountain, near Marysville, he will put more men to work and erect a mill.

#### Salt Lake County.

Work on the mill with which the second-class ore of the Columbus Con. of Alta are to be concentrated is progressing, says Manager C. K. McCormick. It is expected to be in operation September 15.

A second furnace will be added to the equipment of the Yampa smelter at Bingham, which will increase the capacity to 400 tons per day, says Superintendent Craig.

Manager Crowther of the Continental-Alta mines at Alta, says metallurgical experiments on their ores are progressing, and projected mill for their reduction will be completed next season. A tramway between the camp and the valley smelters will also be built.

The Bingham and New Haven Co. has bonded a group of 12 claims covering the southerly portion of the Davis-Gebhardt group near Bingham.

To prepare for transmission of its lead ores at Bingham, the United States M. Co. reports it will build a reversible aerial tramway between the Galena shaft and the receiving station at Old Jordan terminal on the main line, the equipment to span a distance of 1700 feet. At the same time bins to receive the ores will be built at the depot at Bingham, the ores of this class to be handled separately and to be forwarded to the lead-blast furnaces of the smelter that are approaching completion. In operation of the Galena tram the loaded buckets will be made to furnish the required energy, the empties going back as the former go down. The cost of transportation is expected to be reduced to 15 cents per ton. E. E. Allen of Salt Lake City is general superintendent of the United States M. Co.

The Cornish pump in Bingham canyon, near Bingham, by which the Utah C. Co. concentrator is supplied with water, is again in full operation. Of the new battery of vanners, fifteen of the thirty have been set, with the four additional tables being set up. The management is reducing 450 tons of copper, gold and silver-bearing ore daily, says President MacNeill.

The mines of the Ohio C. Co. at Bingham are exceeding the capacity of the mill and will put in additional tables, increasing the battery to eight, says Manager Catrow. The ore is maintaining average of 4% copper, with gold values.

The mill of the Butterfield M. Co. at Bingham is ready for operations, with R. B. Whitmore as superintendent. The management has bodies of milling ore exposed.

#### Summit County.

Pumping is under way at the West Quincy or J. I. C. mine, near Park City, and development work will be resumed, says Superintendent Turner.

The hoisting plant on the Ontario mine, disabled by fire two months ago, has been replaced and was put in operation last week, says Manager Rood. At the Daly mine, also under supervision of Rood, work on the ledge opened up in Mazeppa ground continues.

#### Tooele County.

The Don Pedro mine at Stockton has been sold to W. C. Alexander, J. Dederichs et al. of the Black Diamond M. Co., operating in same camp.

E. J. Kaddatz of Stockton, superintendent of the Honerine mine and mill, says progress is being made in operation at

both mine and mill. The shaft is being sunk from the 800 to the 1000-foot level. In the drain tunnel the water is 2½ feet deep at its face and the flow is 8000 gallons a minute. The mill is treating 300 tons of ore daily.

### WASHINGTON.

#### Ferry County.

The Iron Mountain G. M. Co., says President J. Stack of Republic, is preparing to reopen and develop its property at Republic.

H. B. Dennis and J. Fielding of Spokane have started work on the Meteor mine at Meteor. The hoist, pump and other machinery will be overhauled.—The main tunnel on the Washington Meteor M. Co. ground is being driven, says Superintendent C. Vader.

The Manilla mine, near Keller, will be put in operation this month by J. L. Harper et al. It is reported a consolidation is proposed which will unite two of the largest base-ore properties on the Colville reservation, which will include building a smelting plant at West Fork, where water power is already secured. The Manilla is a copper mine carrying sufficient silver and gold values.

The Syndicate M. & M. Co., D. S. Prescott of Spokane secretary, is increasing development on a group of eleven claims in Meteor camp, in Beulah mining district, west of Daisy, and equipment will be put in. The ores show silver, lead and gold values.

#### Okanogan County.

Mining work is increasing in the Palmer Mountain mining district, around Loomis, says J. Wentworth. The Palmer Mountain Tunnel Co. is excavating and grading for a power plant for the operation of air drills and reduction works. The Copper World Co., which owns the ground on Palmer mountain joining the tunnel company, is also at work, and proposes extensive developments. Work is being done on the Six Eagle mine under the management of J. Haggerty, and the workings are in an ore body. The Copper World Extension is being developed by Ohio men and arrangements made for the erection and equipment of a hoisting plant this season. High-grade ore is being extracted from the Ruby mine. A mill is nearing completion at the Prize mine, at the lower end of Palmer lake. It is a combination of rolls and pulverizer. Arrangements have been made to resume operations on the Night Hawk mine, on the lake opposite the Six Eagle mine.—J. Wentworth is developing the Lone Pine group, north of the properties of the Palmer Mountain Tunnel Co. Developments consist of open cuts and shafts ranging from 20 to 60 feet in depth. The leads carry ores running in gold, silver and copper, the values being \$27 per ton. A crosscut tunnel is being run, which at 200 feet will tap the lead 150 feet below the apex. In development they have opened concentrating ores, besides several shoots carrying sufficient values to warrant shipment.—Machinery for a 10-stamp mill for the Grand View mine is at Riverside, on the Okanogan river. The property is on Palmer lake, opposite the Palmer Mountain Tunnel Co. The ore is free milling gold. The road is being graded from Riverside to the mine, and the millsite is also being graded and the mill is expected to be dropping stamps before winter. A sawmill is being installed near Loomis, which will prove of convenience to the mines. There are prospects of a railroad being built into the district.

After remodeling the plant and changing the process of concentration from dry to wet, the concentrator of the Interstate M. Co., south of Chesaw, was put in operation last week, says Superintendent H. Thompson. The Interstate has let contracts for hauling ores from the Interstate group and the Delate mine to the mill.

Manager Harman of the Ruby mine, on Mount Chapaca, west of Republic, Ferry county, reports increased production of ore carrying silver, lead, copper and gold values. The Ruby Co. will build a mill to treat the ore by electro-chemical process, the main feature of which is said to be the decomposition of ore by electrolysis.

#### Stevens County.

H. Rohwer, of Moline, Ill., part owner of the Double Standard mine near Frontier, says he will increase development, for which equipment will be put in. A 600-foot tunnel, a 150-foot shaft and several crosscut tunnels are driven. The ledge is 22 feet wide and carries gold, copper and silver.

Chevelah reports says the Copper King mine continues shipping ore to the smelter.—D. F. Strobeck, receiver for the Jay Gould mine, is starting development.

#### Whatcom County.

Barron reports state that forest fires have destroyed the stamp mill of the Goat

mine and all of the development improvements on the Whistler mine in Slate Creek district. The property loss is estimated at \$200,000.

### WYOMING.

#### Albany County.

Laramie reports say R. N. Lefe of Pueblo, Colo., president, W. N. McNeel manager and F. A. Twitchell of Canon City, Colo., trustees of the Ideal M. Co., owning a group of claims near Laramie, are preparing to put in \$10,000 worth of mining machinery and \$80,000 worth of machinery to establish a 100-stamp mill, a 500-ton cyanide process, an electric light plant and a sawmill. The company will put men to work developing the properties of the company.

At Douglas the Golden Edge M. & M. Co. will open up its vein with a tunnel, and additional machinery will be put in.—The steam plant for the Evening Star group has been set up on the shaft of the Lucky Penny claim, where a vein carrying values in copper has been cut.

#### Carbon County.

A plant of steam-operated machinery has been put in at the What Cheer, on Dunkard's creek, near Encampment, and mining of copper ore resumed, says Superintendent O. S. Alers. Sinking will continue in the two-compartment shaft.

The discovery of a vein carrying telluride ore is reported made on Billy creek, southeast of Purgatory gulch, 12 miles from Encampment, by J. Wagoner, J. Culleton, L. D. Morrison and C. Forney. The vein is 4 feet in width and fluorite accompanies the telluride. There are no croppings of the lead on the surface, but the vein was uncovered by trenching. To develop the property, consisting of five claims—three on the lead—they have organized the Amethyst G. M. Co.—A tunnel house has been built on El Rey mine, in Purgatory gulch, where the tunnel is exploring the strike made last month. The tunnel is in 60 feet and is being driven on the vein.—The King of the Camp tunnel, in 700 feet, is thought to be near the main vein for which the tunnel was started. In driving 700 feet the King tunnel has cut six leads, showing quartz and iron, the last two leads cut being free milling gold propositions. The other leads show sulphide ore, carrying gold.

### FOREIGN.

#### BRITISH COLUMBIA.

W. F. Robertson, Provincial Mineralogist, has issued figures giving approximate mineral production for British Columbia for the first six months of 1904. An increase is shown over same period of 1903, particularly in silver-lead ores. The Dominion lead bounty is assisting that class of mines. By districts, the following figures are given:

District.	Tons.	Gold. Ozs.	Silver. Ozs.
Rossland.....	183,111	78,487	127,689
Boundary.....	399,119	27,752	182,372
Nelson.....	40,000	11,000	105,000
Slocan.....	8,000	.....	968,000
Ainsworth.....	13,000	.....	120,000
East Kootenay.....	16,000	50	150,000
Coast.....	30,000	3,600	84,000
Miscellaneous.....	8,000	2,500	300,000
Totals.....	697,230	123,339	2,037,061

Total production for 12 months of 1903.....1,286,176 232,831 2,996,204

District.	Copper. Lbs.	Lead. Lbs.
Rossland.....	4,377,900	.....
Boundary.....	10,307,966	.....
Nelson.....	120,000	700,000
Slocan.....	.....	5,000,000
Ainsworth.....	.....	5,000,000
East Kootenay.....	8,000	4,000,000
Coast.....	2,700,000	.....
Miscellaneous.....	5,000	800,000
Totals.....	17,513,886	16,500,000

Total production for 12 months of 1903.....34,359,921 18,089,283

The production from Rossland district was as follows:

Mine.	Tons.
Le Roi.....	88,250
Center Star.....	35,900
War Eagle.....	27,676
Le Roi No. 2.....	20,870
Kootenay.....	3,784
Jumbo.....	4,745
L. X. L.....	682
White Bear.....	905
Spitzee.....	720
Iron Mask.....	70
Total.....	183,111

The principal shipping mines in the Boundary were:

Granby Co.	Tons.
Mother Lode.....	87,986
Emma.....	15,054
Senator.....	1,750
Oro Denoro.....	13,313
Athelstan.....	2,955
Providence.....	436
Elkhorn.....	285
Others.....	400
Total.....	399,119

The Slocan district output reached 8000 tons for the six months, while tonnage for entire year 1903 was 12,412.

#### Boundary District.

There are 1000 men employed in the mines and smelters of the Boundary district.

H. H. Bishop of Chicago, Ill., part owner of the Hesperus G. M. Co., Ltd., owning the Betts & Hesperus group on Hardy mountain, 4 miles from the Granby smelter at Grand Forks, says development work will be started as soon as a compressor plant is installed. He will work thirty men. C. J. McGee of Chicago, Ill., is president of the company. Bishop says they will spend \$40,000 for a plant and for development.

#### Cariboo District.

At the Rambler-Cariboo mine at Kaslo President A. F. McClaine of Tacoma, Wash., says they are only working the upper 300 feet of the mine because of water. Men are driving a 4300-foot tunnel to tap the 1400-foot level and drain the upper levels. It is a silver-lead property.

#### East Kootenay District.

As a result of work on the Kootenay Central Railway, the owners of the Chickamun Stone mine will resume development. The mine is on Bull river, near Fort Steele. The Chickamun Stone M. Co. is incorporated by Spokane, Wash., men. Ore shipments will resume.

#### Rossland District.

Mining operations are under way at the Homestake and Gold King properties, near Rossland, says T. S. Gilmour, secretary of the companies. The Gold King is south of and adjoining the Jumbo mine. Both will be equipped.—It is expected the owners of the High Ore Co. will start work on their mine, which adjoins the Jumbo to the west.

#### Slocan District.

Work will be resumed on the new shaft at the Last Chance mine, near Sandon.—The Payne mine's aerial tram from the mill to the C. P. R. is being remodeled.—McLeod & Thompson have taken up the bond on the Mountain Con. and have sixteen men at work. Assays show silver and lead values. It is intended to drive a tunnel to reach the lead.

#### West Kootenay District.

A. J. G. Sweeney, manager of the Great Western mines, says by Oct. 1st the Five Mile mill at Five Mile, near Trout Lake, will be turning out 2000 ounces of silver per day.

### BRITISH GUIANA.

The Custom House at Georgetown reports exports from January 1 to July 12 were:

	Gold. Ozs.	dwt.	grs.	
1904.....	39,248	11	17	at \$690,354 83
1903.....	44,248	16	17	at 771,646 13
DIAMONDS.				
1904.....	5,011½	carats;	value \$40,951 77	
1903.....	4,306½	.....	36,458 69	

### CANADA.

#### Yukon Territory.

Material for the cyanide plant to be built at the Violet mines, near Dawson City, has arrived, says the Yukon World. The equipment includes redwood tanks and forty iron vats for zinc shavings. The air compressor and drills for the Violet are being put in at the mine. The plant is going up under the supervision of B. S. Revett.

### MEXICO.

#### Agua Calientes.

Agua Calientes reports say the two additional furnaces of the smelter of the American S. & R. Co. will be blown in this week. About 200 carloads of ore arrive at the smelter daily. Copper matte is said to have almost superseded lead smelting there. Copper ores are shipped to the plant from as far away as Sonora, the ores being freighted in bond through the United States via El Paso, Texas.

#### Chihuahua.

At Parral the Rayo mine, near the Adela, owned by Johnson, Crowell & Peterson, is said to be opening a ledge with 3 feet of three ounce gold ore. A survey is being made for the wagon road from Parral to the camp of Guadalupe-y-Calvo, the cost to be divided between the Federal government, the State of Chihuahua and the citizens of the camp. The owners of the Pinos Altos mines are preparing to increase the reduction plant from 60 to 250 tons and put in a cyanide plant.

R. S. Towne reports satisfactory results in the magnetic zinc separation at the mill of the Montezuma Lead Co., the sub-company of the Mexican Metallurgical Co., at Santa Barbara.

P. Ginther, manager of the Encinillas Mines, Ltd. of Santa Rosalia, owning mines and smelter at that place, says the company will buy ores and the 100-ton smelter will be started up as a custom plant.

G. E. Voorhees, Jr., of Santa Barbara,

Cal., has paid the balance of \$85,000 gold on the Las Vegas copper mine, near Coyame, in eastern Chihuahua. Development work continues under Superintendent C. P. Halter. Reports from the mine say bodies of high-grade copper ore are being developed.

A copper property is being taken up west of Santa Barbara by T. M. Hecker et al., who have formed a company in Butte, Mont., for development.—W. K. Ryan of Denver, Colo., has bought 160 pertenencias in Santa Eulalia, covering La Isla, La Iba and El Continente mines.

**Colima.**

(Special Correspondence).—The Cerro Grande Lumber Co. of Chicago, Ill., capital \$1,500,000 gold, will build a railroad 11 miles in length to connect the tract which the company proposes to exploit and the road from Colima to Manzanillo. A bridge will be built across the San Pedro river. The tract lies in the States of Jalisco and Colima, and the timber is estimated to include 360,000,000 feet of oak. W. T. Thornton, former Governor of New Mexico, now of Guadalajara, Jalisco, is president.

Guadalajara, Aug. 19.

**Durango.**

The Penoles Co. of Mapimi is said to have struck 45% lead ore, with gold values, on the Chona vein, which is dipping into ground owned by Monterey people, and on which the latter are preparing to sink a shaft.—The Vivasilas of San Dimas has been sold, says L. M. Raines, to Chicago, Ill., and Cleveland, O., men, for \$500,000 gold.—J. A. Coram of Boston, Mass., has bought a group of mines in Guanacavi, known as the Nueva Australia, Soto and Nuevo Porvenir, containing 150 pertenencias, for \$1,000,000 gold.

It is reported the 100-ton smelter of the Amazon G. M. Co., at Chacala, has been blown in. At the Animas mines of Laveaga Brothers & V. Gomez, the old pan amalgamation plant is being replaced by a 30-ton cyanide plant.

**Guerrero.**

(Special Correspondence).—In La Union district Carrizal parties are preparing to take over the gold property of C. Ruiz at Barranca Hondo. The ore is being worked by arrastras.—Americans have been taking out pay in the placers near Aquino.—J. Luna has been granted an exploration concession covering the Arroya de la Barranca Blanca.

At Los Posos, in the Arroya de la Barranca Blanca, and along the Rio de la Chuta, native gambucinos in the placers are taking out an adarme (1.8 grams) of gold to the man per day. At Los Posos the gold is coarse and associated with white quartz. Flour or float gold is not found.

La Union, Aug. 26.

**Jalisco.**

(Special Correspondence).—Arrangements are made to invest \$300,000 in a water power plant on the Tuxpan river, in the southern part of the State. A concession is given Odilon Villanueva of Hacienda Esperanza; Enrique Schondube and Carlos Landero y Cos, electrical engineers of the City of Mexico, are interested in the plans. The electric current generated will be transmitted to towns, sugar mills and mines in that section of Jalisco.

Guadalajara, Aug. 19.

(Special Correspondence).—The Bautista M. Co., operating three mines near Ayutla, will put in a concentrating plant. Bryant McLellan is manager, address Ameca, Jalisco.

Ayutla, Aug. 24.

Guadalajara reports say the company which holds the Perez concession, which permits of utilization of water power from the Santiago river, proposes to transmit electricity to Aguas Calientes, a distance of 110 miles. The length of river covered by the franchise is 30 miles. The available fall is 670 feet. It is estimated that 30,000 H. P. can be developed. W. A. Rogers of New York is part owner of the concession, and J. M. Garcia, L. Lepetich and L. de Vasquez of Guadalajara are interested.

**Michoacan.**

(Special Correspondence).—An electric plant will be put in at the Inguaran copper mines. Surveys are being made for a railroad to connect the mines with the Uruapan branch of the National Railroad of Mexico.

Inguaran, Aug. 19.

(Special Correspondence).—In Arrio district, owing to strikes of ore in the mines of the Carrizal G. M. Co., the number of men at work in the mines is being increased. A whim has been placed at the mouth of the Bella Vista shaft and the mill will be run on ores from that working. In the main shaft of the Fortuna No. 1, and the crosscut of the Fortuna No. 6, development work will be increased. The mill tailings are being tested as to their availability for cyaniding. The daily clean-up at the mill averages about a pound of gold.

Carrizal, Aug. 26.

At the Maria Louisa mine on the Tacambaro river, the Maria Louisa y Anexas M. Co., with offices in Mexico City, will build a reduction plant.

**Sinaloa.**

(Special Correspondence).—Several carloads of American machinery are being shipped from the Pacific port of Altata to San Fernando, for the San Fernando M. Co. C. W. Pritchett is general manager. The machinery is for the enlargement and improvement of the reduction works at the mines.

A power plant is to be installed on the Plaxtla river by the Guadalupe de los Reyes M. Co. for operating machinery at the mines of the company, and for the town of San Ignacio for lighting and power.

Altata, Aug. 20.

(Special Correspondence).—At the Dura mine, Cosala district, considerable American machinery is to be installed, including a concentrating plant. The mine is the property of Francisco Aragon of Cosala.

Cosala, Aug. 21.

(Special Correspondence).—Harold Miller, secretary of the Occidental Construction Co., is securing right of way for the railroad between Mazatlan and Culiacan, capital of the State. The government of Sinaloa will aid the enterprise.

Culiacan, Aug. 24.

(Special Correspondence).—The Mexican Government proposes to give the Pacific port of Mazatlan a system of water works and sewers. The contract will probably go to Colonel E. K. Smoot, the contractor in charge of the harbor improvements at Manzanillo. Colonel Smoot has offered to do the work for \$1,800,000, Mexican money.

Manzanillo, Aug. 25.

**Sonora.**

It is reported J. C. Bothin of Mexico City will build a salt refinery at Guaymas. He has a government concession for use of machinery for making high-grade salt. He has a lease on Carmen Island on the Pacific coast, with its salt lake, and also a concession for a salt deposit 3½ miles east of Guaymas, near the Sonora railroad. La Providencia is another deposit on the coast of the Altar district which he proposes to exploit.

R. A. Huron, superintendent of the Cochise mine, being opened up by New York men, says machinery and other equipment will be put in.

**Zacatecas.**

(Special Correspondence).—The 50-stamp mill at Mesquite del Oro has been remodeled and will treat 100 tons of ore daily. The mines are owned by an English syndicate, the Mesquite Gold Mines, Ltd. Maurice Cockerill is the general manager. It is estimated that the ore will return a net profit of \$5 per ton.

Mesquite, Aug. 20.

**PHILIPPINE ISLANDS.**

(Special Correspondence).—The Orion M. Co. has ordered a 10-stamp mill which will be erected at its mines on the Island of Masbate, Gillibatin river, 20 miles from the City of Masbate. The ore is low grade and free milling. Water power will run the mill.

The Masbate Placer Co. is preparing to put in a bucket dredger for the placer claims on the Gillibatin river near Masbate. It will have 3000 cubic yards daily capacity.

Masbate, July 20.

(Special Correspondence).—Manila men have organized a company to develop the coal mines on the Island of Mindora. The vein is 6 feet wide. There are 125 men at work developing. J. Kelly is preparing to put in two 3-stamp batteries for his cyanide plant at Antinook, Benguet Province. The ore is base, but high grade, assaying \$36, and the ledge is 3 feet to 10 feet wide. A 375-foot tunnel has been driven.

A small but high-grade body of coal has been struck on the Benguet road, under construction by the Government.

A. Clark is preparing to put in a 10-stamp mill for his mines in Benguet Province, at Antinook.

The Philippine G. M. Co. mill has been shipped from Manila to its mines in Benguet Province, being the first stamp mill in the islands since the war. There were two before the war, but were destroyed. The mining laws are unsatisfactory, but, it is hoped, will be amended soon. They allow an individual or company to own only one claim on the same ledge. Also the high duties on mining machinery are detrimental to the development and operation of mining property.

Banguio, Benguet Province, July 20.

**Personal.**

N. YOUNGBERG is now with the Butterfield M. Co. at Bingham, Utah.

M. McDONALD is manager of the Guanajuato M. Co. at Guanajuato, Mex.

ROSCOE CHANNING is manager of the Utah C. Co., operating at Bingham, Utah.

F. SUSTERSE is manager of the Amparo M. Co., at Etzatlan, Jalisco, Mexico.

J. T. BEEN is chief mining engineer for the Tamarack M. Co., at Calumet, Mich.

R. B. LAMB has returned to Rowena, Boulder county, Colo., from St. Louis, Mo.

C. A. WECK is at Yerington, Nev., on mining examinations from Jamestown, Cal.

T. BRENNAN has resigned as manager of the Della Mountain M. Co., at Hailey, Idaho.

A. L. MORRIS, formerly of Salt Lake City, Utah, is operating mines at Grants Pass, Or.

C. TIMMONS has returned to Los Angeles, Cal., from an examination of mines in Mexico.

T. MILAN of Laredo, Tex., is president of the Vera Cruz & Pacific Railway Co. of Mexico.

R. B. WHITMORE is mill superintendent of the Butterfield M. Co., at Bingham, Utah.

J. R. WILLIAMS of Guanajuato, Mexico, has returned from mining business in Chicago, Ill.

T. KAHLER is superintending dredging operations for Ray & Co., at Tolo, Jackson county, Or.

J. F. KELLEY is superintendent of the West Gold Hill M. & M. Co. mines, at Gunnison, Colo.

P. M. MCCREA is underground superintendent for the Utah-Apex mines at Bingham, Utah.

G. H. CLEVINGER has resigned as mill superintendent of the Horseshoe M. Co., near Deadwood, S. D.

F. G. FRINK is assistant professor of civil engineering in the University of Illinois, at Champaign, Ill.

T. CARROLL of Grass Valley, Cal., is superintendent of the Eureka drift mines in Nevada county, Cal.

P. L. WILLIAMS, JR., superintendent of the Highland Boy mine at Bingham, Utah, is in St. Louis, Mo.

J. M. HILLYER is investigating the iron deposits near the mouth of the Rio Balsas, State of Guerrero, Mexico.

I. E. ROCKWELL is manager of the Della Mountain M. Co., at Hailey, Idaho, vice T. Brennan, resigned.

BERNARD MACDONALD of Spokane, Wash., is at Guanajuato, Mex., where he is erecting a cyanide plant.

L. C. DOTY, formerly superintendent of the mines of the Giroux M. Co. at Ely, Nev., is in Salt Lake City, Utah.

J. W. PROUT, JR., is engineer and metallurgist for the Old Mowry mine in Harshaw district, near Nogales, Ariz.

P. O. WELES is assistant superintendent of the Lake Superior copper smelter at Dollar Bay, Houghton county, Mich.

F. W. MEDBERY of Deadwood, S. D., is secretary and manager of the Reliance G. M. Co., operating in the Black Hills.

J. B. COATS of Atlantic City, Iowa, president of the Oxbow M. Co., is at the company's mine, near Idaho City, Idaho.

W. JENKINS, superintendent of the Home C. Co., returned to Tucson, Ariz., last week from an Eastern business trip.

C. S. ROBINSON, a mine owner of Chihuahua, Mex., has returned to Chihuahua City from Denver, Colo., on mining business.

H. ROHWER of Moline, Ill., is in Rossland, B. C., in the interests of the Eureka, Good Enough and Standard mining companies.

SUPERINTENDENT TURNER, of the West Quincy (J. I. C.) mine at Park City, Utah, has returned there from a European trip.

J. S. STONE, C. E., of the American Bridge Co.'s Chicago, Ill., office, has been transferred to the Toledo, Ohio, office of the company.

G. B. MANSON has been appointed as assistant instructor in mechanical drawing at the Colorado School of Mines, Golden, Colo.

R. E. COLEMAN of Salt Lake City, Utah, part owner of the Lluvia de Oro mine in Urique district, Chihuahua, Mex., is at the mine.

P. SHEAN has resigned as superintendent of the Johnny M. Co. of Stateline, Utah, and has gone to the Groom mines, near Pioche, Nev.

W. W. VAN BAUN of Philadelphia, Pa., of the Granby M. S. & P. Co. at Phoenix, B. C., is examining mining interests in British Columbia.

W. H. BRAY, formerly superintendent and manager of the Posey mine of Nevada City, Cal., will make Reno, Nev., his headquarters hereafter.

W. F. SNYDER, president and manager of the Western Exploration Co., returned last week to Salt Lake City, Utah, from an extended Eastern visit.

P. GINTHER, manager of the Encinillas Mines, Ltd., of Santa Rosalia, Chihuahua, Mex., has returned from London, Eng., on company business.

W. CLUBB, of Alma, Mich., has gone to Cooke, Luna county, N. Mex., as superintendent of the mines of the Luna Lead Co., in Cooke Peak district.

G. E. NELSON, O. STRANDBURG AND C. FORSGREN, interested in the Empire G. M. Co., La Plata, Colo., have returned from there to Jamestown, N. Y.

J. K. TURNER, formerly of the Copper Hill M. Co., near Rinconada, N. M., is manager of the San Cristobal C. Co., near Arroyo Seco, Taos county, N. M.

S. S. RAYMOND, formerly with the Copper King S. Co., in California, is smelter superintendent of the North American C. Co., at Grand Encampment, Wyo.

C. HAMBUECHEN, recently of the University of Wisconsin, engaged in electrochemical researches, is with the Pittsburgh Reduction Co. at East St. Louis, Ill.

J. GROSS, recently with the Alexander Maitland M. Co., at Maitland, S. D., is mill superintendent of the Horseshoe M. Co., near Deadwood, vice G. H. Clevinger, resigned.

L. P. HAMMOND, late Denver manager of the Crocker-Wheeler Co., assumes charge of the sales agency department of the Denver Engineering Works Co., Denver, Colo.

R. E. WARRINER has resigned the general managership of the Bonanza, Ltd., Johannesburg, South Africa, and taken charge in a similar capacity at the French Rand G. M. Co.

H. S. EMLAW, for several years manager of the Steamboat mine, at Park City, Utah, has accepted a position with the McCune mining interests, near Cerro de Pasco, Peru.

KARL KRUG, superintendent of the Lava Beds Dredging Co., has been put in charge of dredging operations for the New York & California Dredging Co. also, 6 miles from Oroville, Cal.

ERNEST W. CLARKE, C. E., of New York City, N. Y., has been appointed by the Panama Canal Commission as engineer in charge of the sewerage and water works to be built at Colon, Panama.

H. HAWGOOD, recently chief engineer of the San Pedro, Los Angeles & Salt Lake R. R. Co., is now consulting engineer for the same company, with offices at Salt Lake City, Utah, and Los Angeles, Cal.

E. W. DUFFEE, superintendent of the Sedalia C. Co., at Salida, Colo., is in San Francisco, Cal., from an examination of Tuolumne county mines for Detroit, Mich., men, and will return to Colorado next week.

W. H. CLARK of Salt Lake City, Utah, treasurer of the Trade Dollar Extension M. Co., is at Silver City, Idaho, superintending operations at the Trade Dollar Extension mine during the absence of Superintendent F. G. Clark.

W. R. WHITNEY has resigned as professor of theoretical chemistry at the Massachusetts Institute of Technology at Boston, Mass., to take charge of the research laboratories of the General Electric Co. at Schenectady, N. Y.

B. E. JAMES has resigned as mill superintendent and metallurgist for the Athabasca-Venus group of mines, near Nelson, B. C., and has gone to Papasquairo, Durango, Mexico, to take a similar position with the Papanton G. M. Co. His former position has been assumed by J. S. Colbath.

H. M. PFLAGER has resigned from the American Steel Foundries to go with the Commonwealth Steel Co., of which company he was elected vice-president at the last meeting. He will have charge of the sales department of the Commonwealth

Steel Co.'s offices, Bank of Commerce Building, St. Louis, Mo.

JAMES ANNAND, for a number of years with the Tomboy mill near Telluride, Colo., left Denver last week on his way to Obuassi, via Sekondi Gold Coast Colony, West Africa, to have charge of the Ashanti Goldfields Corporation, Ltd., mill. Mr. Annand has been with this company the past year and has been spending his vacation in the United States the past few months.

## Obituary.

C. A. ROUSSAN, a pioneer mining man of Alleghany, Sierra county, Cal., died at Alleghany, Aug. 22d.

W. W. MORRIS, principal owner in the Montana-Tonopah mine, of Tonopah, Nev., died in a mine at Reveille, Nev., August 21st, while inspecting the property.

ROBERT PARROTT, discoverer of the Parrott mine at Butte, Mont., died at Des Moines, Ia., August 26th, at the age of 75 years. As a young man Parrott went West, and while prospecting discovered the Parrott copper mine which he later sold to Marcus Daly.

J. W. BEST of Denver, Colo., manager and treasurer of the Northern C. & C. Co., died at Denver August 20th. Deceased was born at Central City, Colo., April, 1875, and was a graduate of the Sheffield Scientific School, Yale University. From 1899 to 1901 he was assistant geologist for the Colorado F. & I. Co.

## Commercial Paragraphs.

THE Mine & Smelter Supply Co., of Denver, Salt Lake and Mexico, has an order from the Southwestern Smelting & Refining Co., for a 200-ton sampling plant at Benson, Arizona.

THE Chilean government has placed a large order for equipment with the Ingersoll-Sergeant Drill Co., including a large Corliss compound compressor and a full complement of pneumatic tools for one of its largest ship yards.

THE Homestake M. Co., Lead, S. Dakota, after having a thorough trial extending over a period of nearly a year, have placed an order with the Stromberg-Carlson Telephone Manufacturing Co., of Chicago, for a number of telephones.

## Books Received.

"The Industrial and Artistic Technology of Paint and Varnish" is the title of a handsome volume by Alvah Horton Sabin, M. S. The book gives the history of varnish and of the various paints, and enters largely into the ingredients, manner of preparing and using these decorative substances. It not only treats of house paints, for both exterior and interior, of furniture polishing, etc., but finds for it and describes many other important industrial uses for paints, etc. A chapter is devoted to painting pipes, structural iron and other objects subjected to corrosive influences. Painting ships' bottoms is another interesting subject. It is handsomely illustrated; 372+VI pages; cloth, \$3. John Wiley & Sons, New York; Chapman & Hall, London.

## Trade Treatises.

In cardinal red, comes finely illustrated description of the machines made by the Gisholt Machine Co., Madison, Wis.

The catalogue of the Lane slow speed roller quartz mill, Los Angeles, Cal., illustrates and describes that device in detail.

Bulletin L607 from the Laidlaw-Dunn-Gordon Co., Cincinnati, O., is devoted to the Meyer gear pumping engines; cross-compound, triplex-compound, fork frames and rolling mill frames.

"The Book of the Four Powers," a sumptuous treatise from the Allis-Chalmers Co., portrays in all the perfection of typography the scope of that company's manufactures, embracing motive power devices actuated by steam, gas, water or electricity. It deserves a place on the reference desk of every mining engineer.

## Latest Market Reports.

SAN FRANCISCO, September 2, 1904.

### METALS.

SILVER.—Per oz., Troy: London, 26½d (standard ounce, 925 fine); New York, bar silver, 57c, refined (1000 fine); San Francisco, 57c; Mexican dollars, 47½c San Francisco, 45½c New York.

COPPER.—New York: Standard, \$12.75; Lake, 1 to 3 casks, \$12.75; Electrolytic, 1 to 3 casks, \$12.75; Casting, 1 to 3 casks, \$12.50; San Francisco: \$15.00. Mill copper plates, \$17.00; bars, 18@24c. London: £57 6s 3d spot per ton.

Copper shows a little sign of strengthening price. As the consumption is fully up to the production, if not exceeding it, the present price is likely to be maintained, if it goes no higher.

The following United States copper exports for first six months of 1904 compared with 1903 are in long tons. Values in matte and ore exported are reduced to fine copper:

	1904.	1903.
January.....	29,085	10,478
February.....	17,073	8,985
March.....	23,852	12,941
April.....	13,983	12,670
May.....	14,772	9,207
June.....	16,279	8,606
July.....	10,688	8,405
August.....	10,688	10,688
September.....	13,000	13,000
October.....	14,597	14,597
November.....	15,887	15,887
December.....	15,887	15,887
Totals.....	114,044	138,495

LEAD.—New York, \$4.30; Salt Lake City, \$3.50; St. Louis, \$4.12½; San Francisco, \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½c; pig, \$4.85. London: £11 12s 6d per long ton.

SPELTER.—New York, \$5.12½; St. Louis, \$5.00; London, £22 16s 3d per ton; San Francisco, ton lots, 6½c; 100-lb. lots, 7c.

TIN.—New York, pig, \$27.10@27.30; San Francisco, ton lots, 28c; 500 lbs., 28½c; 200 lbs., 29c; less, 29½c; bar tin, 30c @ 32½c. London, £123 17s 6d spot.

PLATINUM.—San Francisco, crude, \$18.50 per oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75 @ 82c per gram.

QUICKSILVER.—New York, \$42.00@44.00, large lots; London, £7 15s San Francisco, local, \$41.50@42.50 per flask of 75 lbs.; Denver, \$45.00. Export, \$41.50@42.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 31½c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 17.75c; San Francisco, Plumbers', 100-lb. lots, 15.25c.

ZINC.—Metallic, chemically pure, 3½c; 50c; dust, 3½c; sulphate, 3½c, .04c.

NICKEL.—New York, 40@47c per lb.; ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 31@34c.

### STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$12.85 @13.20; gray forge, \$12.00; San Francisco, bar, 3c per lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$23.00@23.00; open hearth billets, \$23.00 @23.00; San Francisco, bar, 7c to 12c per lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6½c; less than 500 lbs., per lb., 7c; in 25-lb. tin pails, 3c per lb. above keg price; in 1 and 5-lb tin cans, 100 lbs. per case, 4c. per lb. above keg price. Dry Lead.—In bbls., 1 ton and over, 6½c; do. in kegs, 7c.

LUMBER.—(Retail): Pine, ordinary sizes, \$24.00@25.00; extra sizes higher; redwood, \$28.00@30.00; lath, 4 feet, \$4.50 @5.00; pickets, \$21.00; shingles, \$2.50 for No. 1 and \$2.25 for No. 2; shakes, \$13.50 for split and \$15.00 for sawed; rustic, \$28.00 @35.00.

WIRE.—This week the basic prices are: Wire, \$2.77; Cut, \$3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, \$3.35; Cut, \$3.55; 10d to 16d, Wire, \$3.45; Cut, \$3.35; 8d Wire, \$3.50; Cut, \$3.50; 6d and 7d, Wire, \$3.60; Cut, \$3.60; 4 and 5d, Wire, \$3.70; Cut, \$3.70; 3d, Wire, \$3.85; Cut, \$3.85; 2d, Wire, \$4.10; Cut, \$4.10. Special rates for car-load lots.

LIME.—Santa Cruz, \$1.25 country, \$1.25 city per bbl.

CEMENT.—Imported, \$2.15@2.65 per bbl.; California carload lots, \$2.10 f. o. b. at works; small lots, \$2.40 per bbl. in sacks, 4 sacks to bbl., 10c for each sack returned.

### GENERAL SUPPLIES.

ANTIMONY.—New York, Cookson's, 7½c; Hallett's, 6½c; San Francisco, 1000-lb. lots, 8c; 300@500-lb., 8½c; 100-lb. lots, 10½c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1\*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1\*\* 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton,

11½c. No. 2\*\* 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2.00 per keg. CAPS.—3x, \$5.50@6 per 1000; 4x, \$6.50 @7; 5x, \$8@8.50; Lion, \$9@9.50, in lots not less than 1000.

FUSE.—Triple tape, \$4.00 per 1000 feet; double tape, \$3.50; single tape, \$3.10; Hemp, \$2.75; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11½c per set; 14 oz., 40s., 10c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 23@24c per lb.; carloads, 23@23½c; in tins, 30c; soda ash, \$2.00 per 100 lbs.; hyposulphite of soda, 3@3½c per lb.; caustic soda, in drums, 3@3½c per lb.; Cal. s. soda, bbls., \$1.20@1.40 per 100 lbs.; sks., \$1.05; chloride of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2½c; powdered sulphur, 2@3c; flour sulphur, French, 3½@3½c; alum, \$2.00@2.25; California refined, 1½@2c; sulphide of iron, 8c per lb.; copper sulphate, 5½@5½c; chloride of lime, spot, \$2.50@2.75; sulphuric acid, in carboys, 66% B, 1¼@2c per lb.; nitric acid, carboys, 8c per lb.

COAL.—San Francisco, coast, yard prices: Wellington, \$8.00; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallend, \$7.50; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8.00; Cumberland, \$13.00; Cannel, \$8.50; Welsh Anthracite, \$13.00; Rock Springs, \$8.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13.00 in sacks; Sunnyside, \$8.50, long ton.

OILS.—Linseed, boiled, bbl., 57c; cs., 62c; raw, bbl., 55c; cs., 60c; Lucol oil boiled, bbl., 50c; cs., 55c; raw, bbl., 48c; cs., 53c. Kerosene—Pearl, per gal., 19½c; Astral, 19½c; Star, 19½c; Extra Star, 24c; Eocene, 23c; Elaine, 26c; Water White, in bulk, 13c; Mineral Seal, iron bbls., 18c; wooden bbls., 20½c; cs., 24c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22½c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 13c; do., in cs., 19½c; Lard Oil, E. W. S., bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Sperm, crude, 63@68c; Natural White, 63c; Bleached, do., 57c; Whale Oil, cs., 52@57c.

ALUMINUM.—No. 1, 99%, small lots, 37c per lb.; 100 lbs., 35c; 1000 lbs., 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

BORAX.—Concentrated, 6@7c per lb.; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

BONE ASH.—Extra No. 1, 5@6c per lb., No. 1, 4@5c.

RED LEAD.—500 lbs. and over at one purchase, 3½c; 7c; less than 500 lbs., 7½c.

LITHARGE.—Pure, in 25-lb. bags, 8@9c per lb.

MOLYBDENUM.—Best, \$2.00 per lb.

CHROMIUM.—90% and over, 80c per lb.

PHOSPHORUS.—American, 70c per lb.

SILVER.—Chloride, 3½ oz., 90c@1.00; nitrate, 55c.

MERCURY.—Bichloride, 77c per lb.

MAGNESIUM.—Pure, N. Y., 60c.

MANGANESE.—3½c per lb.

SODIUM.—Metal, 3½c per lb.

BISMUTH.—Subnitrate, 3½c per lb.

URANIUM.—Oxide, 3½c per lb.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

## New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR WEEK ENDING AUGUST 23, 1904.

- 768,267.—DISK HARROW—G. H. Adams, Phoenix, Ariz.
- 768,167.—COLLAR BUTTON—L. Blake, S. F.
- 768,420.—CARD CASE—W. S. Brackley, Oakland, Cal.
- 768,509.—COIN CONTROLLED APPARATUS—A. F. Bradshaw, Bieber, Cal.
- 768,519.—BOX LID SUPPORT—A. E. Cox, Ashland, Or.
- 768,122.—LAMP BRACKET—E. D. Hamilton, Vancouver, Wash.
- 768,393.—CLOTHES RACK—J. H. Harrell, Seattle, Wash.
- 768,280.—OIL BURNER—Hitchings & Ellsworth, Corralitos, Cal.
- 768,366.—SURFACING MACHINE—N. Hughes, Portland, Or.
- 768,367.—OIL BURNER—Hunt & Mirk, S. F.
- 768,368.—OIL BURNER—Hunt & Mirk, S. F.
- 768,369.—GAS WASHER—Hunt & Mirk, S. F.
- 768,185.—TELEPHONE—J. W. Kutz, S. F.
- 768,471.—HARVESTER—L. B. Mack, Walla Walla, Wash.
- 768,472.—THRESHER—L. B. Mack, Walla Walla, Wash.
- 768,292.—ANIMAL TRAP—G. J. Miller, Walla Walla, Wash.
- 768,473.—STOOL—P. Nash, Salem, Or.
- 768,139.—CONVERTING MOTION—E. C. Northrup, Riverside, Cal.
- 768,474.—ELECTRIC LAMP—D. O'Brien, S. F.
- 768,463.—COPY HOLDER—J. L. Rivers, Seattle, Wash.
- 768,155.—OIL BURNER—T. Simon, S. F.
- 768,156.—TIE PLATE—J. Snider, Buckley, Wash.
- 768,164.—MATCH SCRATCHER—C. R. Wilson, Bossburg, Wash.

THAT INCESSANT SPRAYING and dripping of water and oil from the exhaust pipe, which rots, rusts and does other damage to roofs and walls, CAN BE STOPPED BY THE

## BURT Exhaust Head.

It is the most perfect head made. Sent anywhere on approval.

"The Burt Exhaust Head have fully come up to our expectations; these expectations were very high."—S. E. Selma (Ala.) Water Co.

THE BURT MFG. CO., Largest Manufacturers of Oil Filters in the World, 221 Main St., Akron, Ohio, U. S. A. Supplied also by Engine Builders, Dealers and Power Contractors.

## ASSESSMENT NOTICES.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 17th day of August, 1904, an assessment (No. 39) of five (5) cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 207 Battery street, Room 15, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 31st day of September, 1904, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 31st day of October, 1904, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
CHAS. BOVONE, Secretary.  
Office—207 Battery street, Room 15, San Francisco, California.

ORLEANS CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of August, 1904, an assessment (No. 2) of seven and a half (7½) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 10, No. 324 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of September, 1904, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 31st day of October, 1904, to pay the delinquent assessment, together with the cost of advertising and expenses of sale.

By order of the Board of Directors.  
GEO. P. THURSTON, Secretary.  
Office—Room 10, No. 324 Pine street, San Francisco, California.

## AUCTION SALE

—OF THE—

200-Ton Capacity Cyaniding Mill, Machinery and Property

—OF THE—

REPUBLIC POWER & CYANIDING CO.,  
At REPUBLIC, WASH.

OCTOBER 8, 1904, AT 10 O'CLOCK A. M.

—CONSISTING OF—

1—No. 5 Style "D" Gates Crusher; Revolving Trommel; Gates High Grade Rolls size 15x36; 1—Style "H" Gates Crusher; 3—Brunton Automatic Samplers; Roll Crushers; Sample Hopper; 2—Revolving Dryers 8 ft. x 26 ft.; Hexagonal Screens 8 ft. x 48 in.; Jeffrey Columns; 2—Columbian Corliss Light Dynamometers; Elevators; 1—Columbian Corliss Engine made by Lane & Bodley Co., cylinder 18" dia. x 42" stroke, weighs about 13,800 lbs.; 1—Corliss Engine 14" cylinder, 36" stroke; 2—Small Engines; necessary shafting, pulleys and bearings for complete equipment of any plant using any or all of this machinery. Blacksmith Shop and Machine Shop Machinery and Appliances Lathes, etc. Assay Furnaces, Balances, Assay and Laboratory Supplies, Stores and Supplies including Pipe and Fittings, Belting, Tools, Electric Supplies, Packing, Oils, Chemicals, Crucibles, Hardware, Crusher and Roaster Parts, Iron, Steel, etc.

The Lands and Buildings of the Company including Five Patented Mineral Claims. The Granite Creek Water Rights, Ditches and Flumes. 28,217 shares of stock in the Tuesday Development Co.

The above named Machinery and Property will be offered for sale in parcels to suit purchasers.

For further particulars, write

W. J. C. WAKEFIELD, Master in Chancery,  
Spokane, Wash.

or, W. G. C. LANSKAIL, Trustee,  
Republic, Wash.

## Mines and Works of Cananea, Mexico.

Cananea is over the international boundary in the State of Sonora, Mexico, about 45 miles southwest-erly from Bisbee, Arizona. The mines are developed in limestone, quartzite and porphyry, and the devel-opment of the district proves these ore deposits to be very extensive and valuable. The district is con-nected by railroad with the Southern Pacific at Dem-ing and Benson. The mines are situated in the Cananea mountains, a range about 25 miles in length and 6 to 10 miles wide. The rocks of the region are limestones, both normal and altered, quartzite, quartz-porphyry, granite and a variety of lavas—rhyolites, andesites, etc.

The copper ores are confined chiefly to the porphyries and silicified limestones. They are chalcopryite and copper glance, malachite, red oxide (cuprite), etc., and metallic copper. The ore bodies occur in irregular masses, as beds following certain bedding planes, and to some extent in fissures, resem-bling somewhat those of the Bisbee district, Arizona. The outcropping ore bodies have been oxidized and weathered to great outcrops of iron gossan contain-ing little copper. Some of the porphyry has been altered to a soft, clayey rock throughout which is scattered crystals of copper glance and chalcopryite. Some of the ore bodies are of large size—over 100 feet in width and 300 feet long.

The ores of the several mines, which are scattered over a wide area, vary greatly in character. The greater bulk of the ore is quartzose, occurring in siliceous limestone, in quartzite, and in quartz-porphyry. In some of the mines the gangue is calcite and garnet, the silica being relatively low. Some ore bodies carry considerable gold and silver, others are low grade in the precious metals. The copper contents range in large amounts, from about 2% to 15% and over. In addition to the standard-gauge railroad connecting with the Southern Pacific rail-road, the company has built about 12 miles of narrow-gauge tramway connecting the various mines with the concentration works and smelter.

The mines are in the Ronquillo district, and the general offices, etc., are located there. (See accom-panying engraving.) Another engraving shows the large concentrating plants, and a third shows the smelting plant, with the brick dust chambers, steel stacks, etc. The old concentrator is built in two divisions, each having a capacity of 300 tons per twenty-four hours. It is equipped with several sets of rolls of various make, trommels, jigs, tables, van-ners, slimers, etc., with rotary mills for regrinding.

Cananea Con. Power House and Dust Chamber, Cananea, Mex.

Ronquillo (Old Cananea), Mex; Smelter and Works of the Cananea Con. Copper Co.

The concentration is effected by water in the usual manner. In the ore manipulation in this concentra-tor about 2000 gallons of water are used per ton of ore. The new concentrator is situated near the old one and has four times the capacity of the latter. The new concentrator is said to be one of the best arranged in the West for treating the miscellaneous ores of this district.

The smelter building has a steel frame, with side<sup>s</sup> and roof of corrugated iron. The furnaces are all of the water-jacketed type, the largest being 42x210 inches at the tuyeres. The former losses in flue dust were very large, but these have been greatly reduced by the large brick dust chamber shown in the engraving, and also by other devices between the smelters and this large chamber.

The Concentrators of the Cananea Con. Copper Co., Cananea, Mex.

IT may truthfully be said no mining investment is without its risk, nor is any other commercial enterprise, but with the knowledge of mining and metallurgy possessed by trained and experienced men engaged in the mining industry to-day, mining can be, and is, robbed of its risks to a very great extent. There are always those, however, who are willing to take large risks for what they believe to be large possible gains, and it is due to this class of people—the plungers, who risk desperately and frequently lose—that it is generally thought mining presents too great risks for legitimate investment. The reverse is the case, however, for no business or line of investment offers as splendid opportunities for the legitimate investment of capital as a carefully considered mining proposition possessing the elements of success when placed in the hands of a competent and honest management.

A FEW years ago the gold mill foreman made it his business, if he understood it, to make as close a saving as possible in the mortars, on the plates and on the concentrators. The cyanide man was then unheard of, though eventually he came, and at first an auxiliary to the metallurgical plant, he has, in some instances at least, come to dominate the entire proposition. He assumes charge of the mill, dictates what screens shall be employed, fixes the height of discharge and gauges the amount of water which the battery man shall feed. He objects in some cases to amalgamation inside the battery, and otherwise has caused many changes, more or less important, to be made in mill practice. As the best results, from an economic standpoint, are the real object of operating mine and mill, the manager should possess sufficient practical knowledge to determine for himself whether the cyanide operations or the amalgamating and concentration process are of the greatest importance to the largest economic success.

## Hoisting Ropes.

In shaft mining there is no factor upon which the safety of men depends to so great an extent as the hoisting rope. For this reason ropes of only the best materials should be used, allowing always a sufficient factor for safety. In all catalogues of rope manufacturers it will be noticed that there is a wide variance between the "breaking strain" of the ropes described and the "allowable working strain or load." This is known as the "factor for safety" and is placed at from one-fifth to one-sixth of the maximum breaking strain. This is essential for the reason that when the load is in motion—as a skip filled with ore, or a cage carrying loaded cars—and is suddenly stopped, or if at rest is suddenly started, the strain upon the rope often approximates its breaking limit and occasionally exceeds it. Moreover, a rope is new but once, and from the moment it is wound on the reel it begins to deteriorate. If a rope could be used for hoisting without winding over a sheave, or upon a reel or drum, it would in all probability last a long time if thoroughly lubricated so as to prevent rusting of the inner strands. In stage winding, where the hoisting plant is situated on the surface, that part of the rope reaching from the lower station to the intermediate one would not wind on either sheave or drum, if in a vertical shaft, and this portion of the rope would, no doubt, last much longer than that portion passing over the sheave and onto the hoisting reel or drum. Still, it is usually considered expedient or advisable to remove the rope from the skip or cage at intervals and to cut off 10 to 15 feet—sometimes more—from the lower end, for the reason that in wet mines the lower end of the rope is constantly saturated with water, and oxidation of the strands in that part of the rope progresses with comparative rapidity. If mine waters are acid, this cutting of the lower end of the rope is more frequently necessary. The greatest wear upon a rope is due to abrasion of the strands upon each other in winding on the reel. Another reason for deterioration is the stresses within the rope itself, due to the slightly unequal length of wires and the shifting of the strain from one part of the rope to another, when it is passing over a sheave, or winding on the drum or reel. For this reason sheaves and winding drums should be of large size. Heavy ropes—that is, those of large diameter—should have much larger sheaves than smaller ropes. For instance, it is figured theoretically that a 2-inch hoisting rope should not be wound over a sheave nor onto a drum smaller than 12 feet diameter, and a 1-inch rope should not be wound on a sheave less than 5½ feet diameter, and a larger diameter is advisable in either case. The strength of the rope depends primarily upon the material from which the rope is made. In testing sections of rope it is difficult to obtain more than 80% to 90% of the aggregate strength of all the wires of the rope, by means of the testing machine, due to the impossibility of making perfect attachments to the ends of the test piece, in order that every wire shall carry its share of the load; to the fact, also, that the inside wires of the strands are shorter than the outside wires, which induces a tendency for them to break. The frequent bending of ropes, which is unavoidable in that portion of the hoisting rope running over the sheave and winding on the drum, in time causes it to unstrand slightly and the wires to twist. An exaggerated example of this condition may be observed when a single wire is taken in the hands and repeatedly bent back and forth, or an end is held in a stationary position by one hand while the other hand, firmly holding the wire, is caused to move in a circle. The wire soon shows a disintegrated, fibrous appearance and its strength is greatly reduced. If the bending is continued the wire will break. This actually happens in hoisting ropes if used too long a time—wires at first "nick" and then break. A careful examination of an old hoisting cable, which has been used too long, will usually discover numerous broken wires. The great friction of the twisting and grouping of the strands holds the broken wires in place, but there is a limit to this, beyond which it is not safe to go. Theoretically, the strength of plow steel is from 190,000 to 350,000 pounds per square inch, but there are sometimes weak spots in the individual wires. These are few, and are really not a great menace.

## Anomaly in Ore Enrichment.

Within the past few years the subject of secondary enrichment of ore bodies has been given much attention, particularly in reference to the occurrence of copper ores. The theories advanced are, in brief, that the oxidation of large masses of low-grade sulphides of iron and copper has resulted in the leaching out of the copper contents and its redeposition at some lower level where conditions are favorable. The generally accepted idea is that the gossan, or "iron hat," represents the remains of the iron sulphide, which, originally turned to iron carbonate, subsequently became limonite, which in some cases, by dehydration, becomes hematite. The gossan may or may not contain copper. The superficial ores of copper—those at or nearest the surface—are the carbonates and oxides. These, either by gradual transition or by a sharp line of demarcation, are succeeded below by the richer copper sulphides, chalcocite, bornite, etc., and these in turn by the normal low-grade sulphide ores of copper and iron (chalcopyrite and pyrite). The copper content of these ores has made a wide range from pure chalcopyrite to those containing a greater or less amount of pyrite and gangue minerals, until the percentage runs down as low as a fraction of 1% copper. The occurrence of enriched sulphide ores of copper (chalcocite and bornite) in the Campo Seco mines, Calaveras county, Cal., at a level far below the zone of normal sulphides, is a matter inviting the attention of the students of secondary enrichment of copper ore bodies. These mines passed through the several zones of oxidation and enrichment many years ago and entered the normal zone of relatively low-grade sulphide ores. Now beneath this is found a lower and unsuspected zone of enrichment, which affords much food for study and thought as to its genesis and possible repetition. It probably represents a condition purely local, where the structure of the rocks was such that a zone or "spot" of enrichment became possible.

## Production Costs.

The most important factor in the operation of a mine is the dividends the proposition can produce. The next most important matter is the production cost, whether the proposition be profitable or not. Often the reports of mine managers show surprisingly low costs, and there are instances where these statements of costs are misleading, for the reason that one or more important items have been omitted. In some cases "general expenses" are not given. It not infrequently occurs that general expenses are a most prominent feature of the operating expense, and are as unavoidable as the cost of stoping or milling, and their omission from a report, either monthly or annual, is misleading. Every mine's manager likes to make a record for producing bullion at a low cost per ton of ore mined and treated, but if he neglects to include general expenses, deterioration, insurance, or interest on invested capital, etc., he can make a good, but false, showing. The report which fails to charge up the cost of power is as incomplete as that which neglects to state the cost of stoping ore. And the report in which dead work is not entered as a legitimate and necessary expense is equally valueless, as a means of comparison, which is the only value a report has to those not directly interested in the property. There are instances where a new manager has the benefit of thousands of dollars worth of deadwork accomplished by his predecessor, and which was absolutely necessary, but which he neglected to mention in his report, and his production costs are apparently far below those of the former manager, who acknowledged the expense and charged it to the work at the time. As a matter of course it is proper to charge this dead work but once, but the fact remains that the new manager is placed in a position to enjoy that for which he is not entitled to credit. This obtains more frequently in mining operations than in mill, concentrator or smelter. There are cases where a new manager can reduce working costs by introducing better methods and better machinery and making innovations wherever he could see they were needed. This is due to superior knowledge and experience, and not to some fortuitous circumstance which aids in making an apparently low cost possible.

## CONCENTRATES.

A FIRE, however intense, if still confined to one room or a small space, can be instantly smothered by throwing ammonia on it.

AURIFEROUS MISPICKEL (arsenical pyrites) has been treated by bromo-cyanide process at the Deloro mine, Hastings county, Ontario, Can.

COAL CLAIMS must conform to the lines of survey. A single individual can take but 160 acres of coal land, nor a corporation or association of persons more than 320 acres.

THE highest electrical voltage now transmitted is 60,000 volts, and the longest transmission is 250 miles. The limit of voltage or distance is now largely a question of expense.

AT an altitude of 15,000 feet oil ceases to possess lubricant powers, though graphite does not. Pure glycerine will furnish the desired lubricating effect above that height.

MUCH of the desert land in California and Arizona has not been surveyed and is open to location as mineral land if mineral deposits can be found thereon. The surveyed areas are also subject to location if not already occupied.

ONE PER CENT of copper carbonate tends to render the cyanide process ineffective; one-tenth of one per cent of antimony or sulphate of zinc in the ore also materially interferes with the extraction of any gold in the ore by the use of cyanide of potassium.

THE rock in which the rich ores of Goldfields, Nev., occurs is described as a brecciated and silicified rhyolite. Where the silica has solidly cemented the rock the gold values are generally low, but where it is crushed and porous the values may run up into fabulous amounts. The gold is said to be found chiefly in the filling and not to a great extent in the massive pieces of the rhyolite breccia.

THE boiling point of water—212° F.—descends about 2° for every 1000 feet of ascent above sea level. The difficulty found in boiling beans and other food at great altitudes can be obviated by the use of specially constructed apparatus. A cooking pot with an air-tight lid and furnished with a safety valve blowing off at a pressure of 15 pounds to the square inch will overcome most of the difficulty mentioned at an altitude exceeding 14,000 feet.

HIGH VOLTAGE in the transmission of electricity is not synonymous with large power. Voltage in electricity may be likened to "head" in hydraulics, and amperage to volume or quantity. An ampere is the unit of quantity, and by the universal agreement of representative bodies of scientists and electricians of the world this unit has been fixed as that current of electricity which deposits 0.0011815 gram, or 0.017253 grain of silver per second on one of the plates of a silver voltameter containing a 20% solution of silver nitrate.

FOR catching fine gold in sluice boxes, cocoa matting and burlap have given satisfaction. Where this is done it is a good idea to run the stream in a box over a grizzly, which will eliminate a large amount of the coarse material and leave only the finer sand and gravel to be handled by the lower box which catches the undersize of the grizzly. Often good results are secured by arranging the burlap or matting on a broad inclined table, the material passing through the grizzly being evenly distributed to the head of the table or "undercurrent," as it is often called.

THOFERN'S process for the treatment of slimes from a copper refinery embraces their lying exposed to the air for a considerable time and then being melted down to be freed from base metallic oxides. This latter is accomplished in a small refinery furnace, lined with magnesite brick, which does not corrode by contact with the slag. The fusion produces a copper matte, containing the silver and gold. The matte is run into plates, and then electrolyzed in special tanks. The residue is again treated for the silver contained therein by the concentrated sulphuric acid process.

WHEN one locates a mining claim he lays it out in the direction of the supposed strike. If, subsequently, it is found that owing to some flexure or other cause the vein passes out of the side line, the locator is entitled to his extralateral right for all that portion of the vein lying between the end line and the point where the vein passes out of the side line, but can take no more, presuming in this case that the end lines of the claim were parallel. If, however, the end lines of the claim are not parallel, he has no extralateral right even though the vein runs entirely through the claim.

ORTHOCLASE FELDSPAR, as an essential constituent of rocks high in silica—that is, trachyte in the strict sense—is characteristic of certain groups of rocks and particular localities. It occurs in the groups found in the great basin and along the Pacific coast, and again

appears as the belt east of the Rocky mountains is reached. The development of phenocrysts of orthoclase in the less siliceous forms of rocks is a special phase of crystallization found in regions where trachytes occur, and is particularly characteristic of the belt along the eastern flank of the Rocky mountains.

TIN SCRAP, where obtainable, is used in preference to iron scrap to precipitate copper from its solutions, for the reasons that the tin scrap consists largely of sheet iron covered with a thin film of tin, and presents a much larger surface than heavier scrap iron of an equal weight and consequently will act more rapidly. It is also usually less expensive than iron scrap of other kinds. Occasionally galvanized iron is used. The sulphuric acid present in the natural copper solution dissolves the zinc which flows away as sulphate of zinc, leaving only a trace of zinc in the cement copper formed.

BY 1 H. P. is meant the amount of energy required to lift 33,000 pounds 1 foot in 1 minute. A force which will raise 33,000 pounds 1 foot in 1 minute is equal to 2 H. P. The size of cylinders of an engine are not a true index of the power of the engine. In addition to this must be considered the pressure of steam in the cylinder, the number of revolutions per minute and the point at which the steam is cut off. The indicated horse power and the actual horse power of an engine are somewhat different. The latter depends upon the frictional and other resistance in the engine and is variable with the different types of engine.

WHEN planning a stamp mill particular care should be given the distribution of ore in the bins. The better plan is to crush the ore in breakers at a point outside the mill, and preferably at the shaft or tunnel mouth, and from bins beneath the breaker load and tram cars either singly or in trains to the mill, having the cars enter through the end of the mill, and the ore distributed uniformly. This prevents the accumulation of most of the fines beneath the grizzly and the coarse rock at the ends of the bins. The rock going to the stamps is more uniform in size and value, and the labors of the mill men are correspondingly diminished.

IN Mexico "petanque" is rock rich in gray copper, and generally carries shipping values in silver. "Orochi" is rock in which the values are all in gold and silver, with the gold predominating. Neither the words "petanque" nor "orochi" are compiled in the vocabulary of the ordinary dictionary of the Spanish language, but are a combination of the Castellana and Indian idioms. The word "petanque" is used principally in the northern States of the Republic, and particularly in the great copper zone of Sonora. The term has also been applied to other dark, semi-metallic, heavy ores, rich in silver.

TALC, for paper manufacture and other purposes, is mined at a number of localities in the United States, notably in Georgia, Vermont, New York, North Carolina, Massachusetts, Pennsylvania, Maryland, Virginia and other Eastern States. Large bodies of talc, some of them of commercial value, are known in California, in Shasta and Riverside counties. These latter deposits are not worked extensively owing to high cost of transportation. In 1903 there were mined in the United States over \$6,901 tons of talc and soapstone in their varied forms, valued at \$840,000. New York State is the largest producer, the output of 1903 being over 60,000 tons, valued at \$421,600.

METALLIC MANGANESE is very little used in either arts or manufactures, is difficult of its reduction from its ores and is only produced in very small quantity for test work in laboratories, etc. It is worth about \$20 per pound. Manganese ores of high grade bring prices depending largely upon supply and demand, there being no fixed prices. In California the crude ore as it comes from the mine is worth in San Francisco about \$10 per ton. It is ground and disposed of by dealers at about \$20 per ton. The ore sample is pyrolusite (manganese dioxide) and is apparently high grade and free from impurity to a great extent. It is useful as a flux in some smelting operations, also in the manufacture of steel.

EUCALYPTUS TIMBERS are used extensively in the mines of some portions of Australia, but, as far as known, they are used to a very limited extent, if at all, in America, although large amounts of eucalypts (mostly blue gum) are grown in California. Eucalyptus is said to make durable battery stamp guides. Redwood is employed to a limited extent as mine timbers, chiefly at New Almaden quicksilver mines in Santa Clara county, Cal. Oak is occasionally found in mines, but its greater cost and the difficulty of framing it discourage its extensive use, although undoubtedly superior to other kinds of timber of the same size. In the West one drawback to the employment of oak underground is the difficulty experienced in securing sound logs of large size.

CONCRETE is superior to brick or stone for compressor foundations, unless the stones are of very large size. A compressor is subjected to more vibration than steam engines, and must be securely anchored. A few hoisting engines have been made having the anchor-bolt holes elongated instead of round, the object being, it was stated, to relieve the jar upon the engine. In practical use it was not demonstrated that this device was desira-

ble. Engines, like compressors, should be solidly and immovably bolted to the foundations which must be massive enough to sustain any shock to which it may be subjected. If there be any lost motion this will soon be increased by the movement and vibration of the engine, and in time will result in serious damage to the engine.

THE number of feet that may be drilled in a shift of eight hours by hand must depend upon the hardness and toughness of the rock and upon the expertness, as well as the energy, of the miner. In hard granite 7 to 8 feet per shift is considered good hand work. In solid quartz rock it may be more or less, according to the character of the quartz. Some quartz cuts much easier than others; a flaky glassy quartz will cut more rapidly than a dense quartz rock like flint or quartzite. Among the hardest rocks are metamorphic rocks (originally shales), which are found silicified and impregnated with finely disseminated iron sulphide. Rocks of this character are sometimes so hard as to discourage all attempts at hand drilling. Some diorite and diabase dikes are not only very hard, but also extremely tough.

SOME constructing engineers who advise against flat ore bins, suggest a compromise between flat floors and those that are inclined by employing both in the same bin. This is accomplished by building that portion of the bin next the ore chutes flat, providing the rear portion with an incline of about 40°. This admits a larger tonnage than those bins having wholly inclined bottoms, and to a great extent overcomes the necessity for shoveling when cleaning up the bin, and, moreover, a mass of ore will rest on the flat floor and on the lower part of the inclined floor protecting it from the excessive wear incident to inclined floors, which slope up to the front of the bin. Iron plates should be secured above the chute doors, as the constant downward movement of the ore toward the door when the bin is well filled will wear away the planks of which the bin is constructed.

TINNED SCREENS are preferred by some mill men to any others, but the only actual advantage apparent in them is that the coating of tin prevents the screen becoming rusty before use, whereas, steel or iron screens not tinned, but made of equally good material, may rust if not properly cared for before being tacked on to the screen frame. Some mill men burn the screens to remove the tin, others do not. The burning, it is claimed, anneals the screen, but the metal of which tinned screens are made does not really require annealing. A test on adjoining batteries with burned and unburned screens would give reliable information as to the advisability of burning the screens before use. When tests of this kind are made it is necessary that the height of discharge during the trial be essentially the same during the test, and that the rock fed to the respective mortars be of essentially similar character and size.

WHERE the amount of water making in a mine can be handled with skips it is the best practice to equip one compartment of the shaft for this purpose, using a skip of as large dimensions as can be operated in the shaft. It is also a good idea to provide a separate engine for the bailing skip, that the handling of ore, men and materials shall not interfere with the bailing. Bailing skips have been successfully run tandem, as many as three being used at one time, each being provided with an automatic device for discharging and operating independently, but at the same moment. The largest skips hold from 1500 to 2000 gallons, or from six to eight tons of water, exclusive of the weight of skip and rope. A skip of this capacity will weigh about 2500 pounds, more or less, according to the character of the bottom (whether heavy cast iron or sheet steel), the number of bolts and stays, and whether the skip is equipped with hood for protection of men.

THE stamps in use in the mills of the Witwatersrand weigh 1000 to 1250 pounds; the stems are 16 feet long, 3½ inches diameter, with 20x9-inch bosshead and 12x9-inch shoes. The speed of drop is about 95 per minute, a height of 8 inches; screens range from 600 to 1000 holes per square inch, 700 (about 26.5 mesh) being about the average. The height of discharge is kept near 6 inches, and five tons of water are used to each ton of ore crushed. With the 700-mesh light screen and 1050-pound stamp, the average amount crushed of deep level ore is 4.8 tons, varying somewhat with the different mines. Some California mills crush upward of five tons per stamp per day through a 900-screen (30 mesh). Such ore is soft, slaty or schistose rock, with sufficient quartz to cause the soft material to pass rapidly through the screens. When the tonnage crushed exceeds five tons per stamp daily a coarser screen is generally used, though seldom coarser than 400 (20 mesh). The instance mentioned in the query to which this paragraph is a reply, where it is stated that ten tons are being crushed per stamp in a California mill, is probably exaggerated, as the rock is not actually weighed, but estimated by the number of cars sent to the mill. This rock consists of soft decomposed amphibolite schist, loam, grass roots and other debris incidental to rock mined in surface workings. It is loose and relatively light, and as a 30-screen (900 mesh) is used the tonnage may be safely discounted by a liberal percentage. In milling gold ore the idea should be to make the largest saving of values economically possible, and not to endeavor to secure large tonnage capacity at the expense of unnecessarily high tailings.

## Mining in Sierra County, Cal.

[FROM A STAFF CORRESPONDENT.]

While one of the most inaccessible of the mining counties of California, yet Sierra county is one of the oldest of the gold producing counties in the State. Mining there has been marked by a transition from the conditions of the '50s to those of to-day, yet in this length of time it is surprising how little actual change has been made.

The early workers in the region were placer miners. As the river beds were gradually worked out, more attention was given to hydraulicking the large gravel deposits of the region. This method was becoming of great economical importance when it was checked by legislation in the '80s. Since that time hydraulicking, under restriction, has been continued in a desultory way. Its place has largely been taken by drift mining, the miner following the richer recent gravel channels as well as the greater lava capped ancient gravel channels. A number of quartz ledges were discovered and have been worked off and on, some of them for nearly fifty years. In drifting in the bedrock under the lava good quartz veins are often found, their apexes being covered with lava and their discovery dependent on chance. These often prove more profitable than the gravel channels, and are now being worked through tunnels originally run to reach the channels.

In brief, the above is the evolution of mining in Sierra county. At present this county is the home of the prospector and small miner. Every canyon and gulch are staked with claims, many of which are being worked by three and four men. In the aggregate these small mines involve as much labor and capital as do the few large mines in the more southern mining counties of the State. Occasionally these claims have developed into large properties, employing many men and producing handsomely. But it may be safely stated that, as a rule, Sierra is essentially the county of the prospector.

In a trip extending through the width of the county west of the summit of the Sierras many of these mines were visited, and a description of the conditions throughout the county will undoubtedly prove of interest, not only as a mere description of the county, but also as a statement of the commercial needs of the miners, for each mine is continually installing machinery. The county will be described by towns from south to north.

At Pike City the Alaska mine has been bought for \$10,000, and on August 8 men were unwatering the shaft preparatory to further development. This mine has been worked intermittently by different companies since 1856, an 8-stamp mill having been put up in 1858. During this time over \$1,000,000 has been taken out, mostly from the surface. The present intention is to test the value with increase in depth. The present shaft has been sunk 462 feet vertical and will be continued. A 20-stamp mill is on the property, the 40-stamp mill having been burned. The company is hauling in electrical machinery and an air compressor from above Oroville. George St. Johns has charge of the property. The development of this mine will materially aid Pike City.

Thirty men are at work at the Plumbago mine, below Alleghany. This quartz property has been steadily producing for a number of years. The tunnel is in nearly 1300 feet. The mine is equipped with a 20-stamp mill, also a power plant generating electricity for the Plumbago and the Oriental.

At Alleghany the tunnel of the Oriental mine has been driven in 3650 feet, and a branch of the main quartz ledge has been struck. The vein occurs in diorite and has been partially developed by a 1000-foot shaft. H. L. Johnson is superintendent in charge. M. W. Mather is manager.

H. L. Johnson, the bonder of the Tightner mine, reports a mill return of \$3100 from a mill run on 1000 pounds of specimen ore taken from the large shoot recently opened up. The shoot has been followed 75 feet and averages 15 feet in width. The rich rock is found as a ribboned quartz within 2 feet of the serpentine hanging wall. The foot wall is schist. It is planned to start a 1000-foot drift to intersect this and other known shoots at a lower level. A 10-stamp mill will probably be put in near the mouth of the tunnel.

Drift mining in the southern part of the county has been an important industry since the early fifties. The so-called blue lead extends through the county parallel to the main range of the Sierras and at right angles to the present streams. The channel was discovered in 1852 near Minnesota. This body of gravel is capped with several hundred feet of volcanic debris. The paying portion is about 300 feet wide and from 1 to 3 feet deep, lying on or near the bedrock.

At Alleghany the Deep Blue Gravel M. Co. has drifted 1250 feet and hopes to find this second channel within 50 feet. Five men are at work at present. H. N. Dickerman has charge.

J. W. Morrell is running a 1000-foot drift to tap the channel at Balsam Flat. He also has the Steamboat claim under bond, working twenty men.

At Forest, J. M. Harper has six men at work at the American Hill. The tunnel has been driven 1300 feet through slate to intersect the Henness

pass ridge channel. At the Diadem J. M. Harper has four men at work prospecting at the 125-foot level of the 275-foot shaft. Four men are at work at the Mabel Murch gravel mine, 6 miles above Forest. The Young America mine will start up September 1st, and the tunnel will be run to tap the channel. Timber and other contracts are being let. W. W. Tiner will have charge. At the Ruby mine W. Wolf has four men at work in the gravel mine. A bedrock tunnel has been run 3000 feet and has recently tapped the main blue lead channel. As more water is available later in the season, the quartz mine on this property will also be opened up. It is the intention to install a dynamo and electric hoist to be run by a 12 H. P. gasoline engine.

Manager Pinkston has forty-five men at work at the Sierra Buttes mine, Sierra City. This old property has been revived and now gives every indication of becoming again a steady producer for years to come. A 20-stamp mill is in place near the mine and a new 40-stamp mill is to be installed near the river early in 1905. A 150-ton cyanide plant is being installed near the river to handle the tailings from both mills, the tailings being delivered from the 20-stamp mill through a flume. The plant consists of six 150-ton percolation vats, five days' treatment being contemplated. During the winter the plant will handle the tailings that have accumulated.

The new 10-stamp mill at the Keystone mine will probably be finished by the middle of October. At present the company is running a tunnel under the old workings. Stopping will be commenced when the mill is completed. R. Nye is in charge.

At the King Consolidated mine, near the Keystone, two men are driving the lower tunnel now in 425 feet and connected with the 135-foot upper tunnel by a 300-foot raise. The quartz vein in slate formation is about 5 feet in width, and a mill test returned \$8 per ton, of which \$6 is free milling. The company plans to erect a 5-stamp mill this fall.

The Mountain mine, above Sierra City, has fifteen men at work underground and is rehabilitating the 40 stamp mill. New foundations for the mortar blocks are being laid on concrete. Twenty stamps will be repaired and started immediately, the other twenty to be also promptly repaired. New amalgamating tables are being constructed. Algernon Del Mar is millman; L. H. Carver, superintendent in charge.

R. Phelan has men working at the Butte Saddle mine, a quartz proposition equipped with a 10-stamp mill and 6000 feet of aerial tramway.

In addition to these quartz claims a large number of placer and hydraulic mines are being worked in a small way. Good values are being received from the cleanups of the Klondike and Roman, owned by R. Phelan.

At the Pride mine, hydraulicking under the restrictions imposed by the United States Debris Commission has been in progress since May 2. The water being about exhausted, cleanup has been just finished. Work on the debris dam will be continued, getting ready for next spring. Arthur Pride is in charge. The same conditions obtain at the Westall mine.

In the vicinity of Downieville there is considerable prospecting and mining on a small scale being done, although somewhat curtailed at this time of the year by a scarcity of water. Of the larger properties the White Bear mine, 7 miles north of Downieville, is steadily producing. This drift mine has a narrower channel than the majority of the California drift mines, but it is of higher grade. The value lies chiefly on or near bedrock, but in mining the whole height of the channel (4 feet) is removed and washed. In starting the mine, tunnel No. 1 was driven 550 feet, but the gravel not being found a raise of 112 feet was made to No. 3, when the main channel was found. A tunnel was driven at No. 2 for ventilation and drainage. A large amount of gravel has been blocked out by the 1700 feet of drift in No. 3. The gravel is hauled from the working face to the collar of the raise by horses. Here it is dumped to No. 1, whence it is run out to the washing plant at the mouth of the tunnel. Here the gravel is hydraulicked and run through sluices. This mine is the largest producer in the vicinity of Downieville. W. J. Belcher is superintendent.

Adjoining the White Bear on the north is the Telegraph mine, under the superintendence of J. W. Finney. The tunnel on this property was originally run to tap the gravel channel, but intersected a number of quartz veins in its course. These have since proved more profitable than the gravel. The croppings of these veins are capped with lava and their discovery depends upon chance. Undoubtedly there are many quartz veins, the probable sources of gold in the gravel channels, covered by these immense lava flows and only to be discovered by chance or systematic search. A 5-stamp mill has been installed and a mortar block is in place for another five. Water power is available most of the year, but a complete auxiliary steam plant has been installed. The sulphurets are high grade and are saved on two concentrators.

There is considerable activity in both placer and quartz mining around Poker Flat—postoffice at Howland Flat. J. Freeborough has three men at work at the Alhambra quartz mine and hopes to get his Huntington mill running by fall. He intends to install concentrators. At the Strassner, J. B. Lassiat

of the Poker Flat G. M. Co. employs four men. Due to a failure in water supply the mill is not running at present. Poor & Johnson are working the Soldier Boy placer at Deadwood, and C. Keller is working the Bunker Hill drift mine. J. and A. Keefer are sinking a bedrock shaft at the Gibraltar. J. M. Pride has four men driving a tunnel to tap the channel at the Carlton Con.

Port Wine and La Porte were famous camps in the days of unrestrained hydraulic mining, but at present little is being done beyond placer and drift mining during the wet season. Running north from La Porte through Gibsonville, is a great gravel channel that promises well for the future. A tunnel is being run to tap it at the Claybank. The Bellvue and the Tabor mines at Gibsonville have already reached it. This channel was originally worked by the Thistle shaft, but work had to be discontinued because of the water. Bore holes were then made with an oil-well drill to determine the direction of the channel, and following the results obtained the Bellvue tunnel was driven 5400 feet, only to find that it struck the top instead of the bottom of the channel. The company is now engaged in changing the grade of the last 1200 feet of the tunnel so as to avoid the disadvantages of an incline. The surface works were burned out on July 17, but have now been almost completely rebuilt. Two Pelton water wheels furnish power to run the compressor, blower and machine tools. When the channel has been opened it is expected to put in an electric haulage plant. Thirty men are at work at present and a larger force will soon be put on. C. B. Wingate is superintendent.

At the Tabor mine a 4000-foot drift and 320-foot incline have been run. A 40 H. P. boiler and engine belted to a dynamo furnish power to run a 10 H. P. hoist at the top of the incline, the air fan and the two 3-inch Jackson centrifugal pumps which are set tandem, the upper pump taking the water raised by the lower machine, thus doubling the lift of the pumps. Each is operated by a separate 5 H. P. direct-connected motor. It is the intention to install a complete electric haulage plant. "T" rails are laid in the mine. When water power is abundant this is utilized by employing Pelton wheels under 140 feet head.

This district labors under many disadvantages, as to short season, isolation from outside world, high altitude and expensive freight rates—5 cents per pound during part of the year—yet the mines are enabled to endure in the face of these drawbacks. Many mines face their wooden tracks with strap iron in preference to paying the high freight rates on "T" rails.

Downieville, Aug. 25.

## How Some Mines Are Promoted.

TO THE EDITOR:—I read with much interest a recently published article in the MINING AND SCIENTIFIC PRESS, under the heading of "How Some Mines Are Promoted," and it would be gratifying to many to see this important question more fully expounded and "pressed home," not only for the benefit of the speculator, or investor, but for the standing credit of the introducer, or promoter.

I have been connected with mining and industrial promoting companies for some fourteen years, and your article (in many, if not the majority of cases) is a good and fair explanation of the cause of so many failures and downfalls, and, instead of encouragement, brings only disappointment and disgust to the shareholder.

Of course, the blame does not rest with the vendor. He will get all he can for his property. We then have to come to the promoter, or middleman, who gets hold of that property and introduces it to the purchaser. He presents it in all its colors and possibilities, and the purchaser takes for granted many of his statements, or else omits to inquire into them. He issues his prospectus to the public, as your article says, with an overcapitalization. The public sees it, and, because it has a big capitalization, thinks it's a "big thing," not realizing that that "big thing" has to make a mighty big profit to satisfy their desires. And what is the result? They ultimately find their remedy in a good round pill wrapped up in a call notice of \$1 a share; and, rather than lose their \$5, they will try and "prop up" their first investment by paying this call or supporting the reconstruction advised by the directors.

The remedy is administered, the effect doesn't take place, a coffin is built, laid down and buried, but the memorial cards are placed in an album and never forgotten, and the man who has one says, "Never again."

I would like to see your article taken up and extended, not only by yourselves, but by other contemporaries, both in the States and England, and I am sending a copy of your issue to London to a friend of mine for that purpose, and hope it will eventually meet the eyes of others, who will also take the matter up, and, moreover, keep it before the public, whose support and protection is of the first importance in the mining business.

A SUBSCRIBER.  
Ocampo, Mexico, Aug. 28.

The Desert Dry Lakes of California.

NUMBER III.

Written for the MINING AND SCIENTIFIC PRESS BY  
G. E. BAILEY, E. M.

DRY LAKES VALUABLE WHETHER SALINES ARE VISIBLE OR NOT.—Attention has been called to the fact that all of the dry lakes are recognized as saline by scientists; but some one may say, "I know of a dry lake that looks like a sheet of yellow clay, with nothing but a little alkali showing in patches here and there." It is admitted that at certain times some of the dry lakes may present this appearance, yet it remains a fact that all the dry lakes contain valuable salines, whether these salines are visible to the eye at all times or not. It should be remembered: First, that these lakes are the lowest depressions of ancient saline lakes of vast area; second, that these depressions have been filling gradually through long geological ages; third, that this process of filling is not yet ended, but is going on at the present day; fourth, that the appearance of these lakes depends much upon the local conditions of the atmosphere at the time they are visited. For a short time, or for a few days, after one of the rare rainstorms that occasionally visit the desert, they may be veritable lakes of water. After a cloudburst they may be covered with a heavy layer of clay and gravel. When the hot sun has dried up the shallow waters, they may be white and glistening with an efflorescence of saline crystals; but violent sandstorms a few days later

were not dissolved again, being protected by the clay layers and marls that absorbed the efflorescent salines when the lake was greatly concentrated by evaporation. Thus, alternating evaporation and filling have been large factors in forming the stratified layers of clays and saline matters now found in the deserts.

Naturally but few borings or shafts have been put down on these dry lakes, but the few that have been made show that the bowls of the lakes contain exactly the formations as pointed out by the scientists, and that some of these layers contain rare and valuable salines.

In the tenth annual report of the State Mineralogist of California, 1890, the following data are given of the borings made in the Searles or Borax lake, in the northern part of San Bernardino county, Cal., the borings being made in the southern, or dryest, and most sandy portion of the lake:

The borings mentioned, commenced in 1887, disclosed the following underlying formations, the successive strata passed through having been observed and noted by Superintendent Searles:

Two feet of salt and thenardite.  
Four feet of clay and volcanic sand, containing a few crystals and bunches of hanksite.

Eight feet of volcanic sand, and black, tenacious clay, with bunches of trona, of black shiny luster, from inclosed mud.

Eight-foot stratum, consisting of volcanic sand containing glauberite, thenardite, and a few varied hexagonal crystals of hanksite.

Twenty-eight feet of trona of uniform thickness, other borings showing that this valuable mineral extends over a large area.

Twenty-foot stratum of black, slushy, soft mud, smelling strongly of hydrosulphuric acid, in which there are layers of glauberite, soda, and hanksite. The water has a density of 30° B.

ardite and trona; most of these occurring, however, in small quantities only. Artesian water was obtained at a depth of 55 feet that rose 3 feet above the surface. The dry, hard playa crust, about 1 foot thick, was analyzed by C. N. Hake as follows:

	Per Cent.
Sand.....	50.0
Soda sulphate.....	16.0
Salt.....	12.0
Soda carbonate.....	10.0
Borax.....	12.0
Total.....	100.0

The method of working was simple, consisting of scraping the dust into windrows and then gathering by carts and taking it to the works 2 miles distant. It was noticed here in digging the crystals out of the mud that the crystals grew. The holes left soon filled with water containing boric acid in solution; this, coming into contact with soda, formed crystals of baborate of soda (borax), which were deposited in the mud. Large vats were dug in the mud and brush thrown in for the crystals to form on. On ground that had been worked over a new crust formed also that was thick enough to remove in three or four years. Such growths give the following analysis:

	Six Months.	Two Years.	Three Years.	Four Years.
Sand, per cent.....	58.0	55.4	52.4	53.3
Soda carbonate, per cent.....	5.2	5.0	8.1	8.0
Soda sulphate, per cent.....	11.7	16.7	16.6	16.0
Soda chloride, per cent.....	10.9	10.0	11.1	11.8
Borax, per cent.....	14.2	12.9	11.8	10.9

It will be noted that the borax is richest at first and that the sodas increase faster than the borax. The effect of the Æolian sands is especially noticeable. These analyses throw considerable light upon the genesis of the deposits.

At Lake Danby, in the southeastern portion of San Bernardino county, the following facts are noted in Bulletin No. 24:

The Surprise salt mines are located about 25 miles

Bristol City, San Bernardino County, Cal., Situated on a Dry Lake Covering Over 200 Square Miles. In This Lake are Beds of Rock Salt, Borax and Gypsum.

may cover them with a layer of fine sand, concealing the salines.

The effect of these sands moved by the winds of the desert is described in Bulletin No. 24, under the title of "Æolian Sands," as follows:

The traveler is apt to make his first acquaintance with these when they are in motion, filling the air with dust, sand, and gravel, which are blinding, choking and irritating beyond all description—on account of the alkaline material with which they are saturated. Sand sprouts or "sand augers," as the desert men call them, may often be seen as slender, writhing, twisting columns of sand, a mile high, that sag and sway and twist here and there with sinuous grace, only to disappear, ghost-like, as mysteriously as they appeared. When at a distance, he can admire the slender, hollow dust columns, that move to and fro like pillars of smoke, according to the caprice of Æolus. Dust storms that last three days are not uncommon, and in the distance look like clouds of smoke. The presence of sand in large quantities in the salt, soda, borax, and niter beds, is soon understood, if one studies the Æolian sands awhile. At the Searles borax lake it was found that, after a crust had been removed from one part of the marsh, it filled with water that soon deposited crystals of borax, and in six months the waters were blown so full of fine sand that the new crust contained 50% of sand. These sands account for the presence of sand in all of the playa lake deposits of the desert.

I. C. Russell says of this filling and refilling and covering over and concealing of the salines (page 64, Lake Lahontan):

In some instances easily soluble salts form a large percentage of the deposit, which then becomes a salt bed, a bed of gypsum, or is largely composed of other similar salts. At times these deposits become covered with mechanical sediments, and perhaps buried so deeply that they are not again dissolved when the basin is reoccupied by a lake. Examples of salt playas are numerous, especially in southern Nevada, where they are of economic importance, and (besides common salt) frequently contain large quantities of sodium sulphate and carbonate, borax, etc. In some instances the lower portions of earthy playas are saturated with brine, which, when raised to the surface and evaporated, is capable of supplying an almost unlimited quantity of salt.

In speaking of the geological history of Lakes Aubury and Le Conte, Bulletin No. 24 says:

At the times when the two great lakes approached complete desiccation, their pools formed independent areas or lakes, which completely evaporated. The saline matter precipitated at such times was so completely buried beneath playa deposits that when the lakes were filled with water again, during another oscillation, the salts

This dry lake then conceals beneath its surface of sand: First, 2 feet of salt, and thenardite—that is, 2 feet of common salt mixed with sulphate of soda (Glauber salts); second, 12 feet of clay and sand, containing more or less salines; third, an 8-foot laver of sand containing glauberite (sulphate of soda and lime) and thenardite (sulphate of soda)—while below this comes a remarkable stratum of 28 feet of trona, of uniform thickness, as shown by other borings. The value of this deposit will be appreciated when it is explained that the trona of the mineralogist is the sesquicarbonate of soda of the chemist, or the baking soda of our kitchens. This remarkable dry lake then contains layers of table salt, 2 feet thick, and a 28-foot layer of baking soda, besides plenty of Glauber salts that can be reached by a shaft 22 feet deep, and developed by a shaft 50 feet deep. Besides these there are 16 feet of clays and sand impregnated with sodas that would yield a soda brine if the boring were filled with water. At the borax works farther north on Searles lake, artesian waters were found that did give borax brines. The following account, showing the value of these borings, is taken from the description of Searles lake and the operations there, Bulletin No. 24:

The beds are of special interest, as the operations there in 1874 and for several years later were the training school at which many leaders in later years studied the borates. The beds were discovered Feb. 14, 1863, by Dennis Searles and E. M. Skillings, but work did not begin until 1874. The San Bernardino Borax Mining Co. was incorporated in 1878 to work these beds. The borax beds are near the center of a playa lake that is 10 miles long by 5 miles wide, situated 1700 feet above sea level. The portion productive of borax is an oblong area of about 1700 acres, slightly depressed below the general level of the playa. Water stands in this area to the depth of a foot in wet seasons. The old shore lines of this arm of Lake Aubury are distinctly to be seen on the slopes of the Slate and Argus ranges, some 600 feet above the playa lake, showing the different levels of the ancient lake. The water on the beds is of a dark-brown color of 28° density, Baume. The mud below the water was full of large crystals, occurring in nests as in Lake county, at irregular intervals to a depth of 3 or 4 feet. The natural crystals were of a green color, transparent, and often contained fluids in their large cavities. Curiously enough no ulexite or colemanite was ever found in this playa. Thirteen tons of the crude material produced one ton of borax, equal to 7.69%. The beds were not regular, but quite spotted in borax. The associated minerals were anhydrite, calcite, celestite, cerargyrite, documonte, embolite, gay-lussite, glauberite, gold, gypsum, halite, hanksite, natron, soda, niter, sulphur, then-

southeast of Danby, a station on the Santa Fe Railroad. They are located in the bottom of a dry valley, about 6 miles from the south end of Old Woman's mountains. The rock salt lies in two strata, each from 2 inches to 8 feet in thickness, separated from each other by a thick seam of clay and covered by a layer of sand and dust that is from a few inches to 2 feet in thickness. The salt bed has been developed over a tract of some forty acres and the claims of the locators cover over 800 acres. For some time this deposit was worked by the Crystal Salt Co., who hauled the salt to Danby in traction wagons. The larger portion of the product was sold to the silver mills for use in chloridizing. Some of this salt has been shipped to San Francisco and proved to be of superior quality. In 1882, J. B. Cook is said to have dug a shaft 35 feet in solid rock salt before water was reached. A 65-foot shaft, now caved in, is said to have shown 22 feet of solid crystal salt. An analysis of the clear rock salt gave: Sodium chloride, 98%; water, 1.3%, and traces of silica, iron, aluminum, potassium and calcium.

The New Liverpool Salt Co. attempted to find the bottom of the great Salton basin with the following results:

Borings made at Salton give the following strata:  
(1) Below the salt crust was 6 inches of mud resting on (2) 7 inches of a crust composed of chlorides of sodium and magnesium; (3) 22 feet of black ooze containing 50% of water and carrying both the chlorides and carbonates of sodium and magnesium.

This boring shows the existence of 22 feet of ooze saturated with a brine rich in salt, carbonate of soda and magnesia. The day will come when such brines will be used by the chemical factories. It has been the usual experience of prospectors and others that it was useless to dig down in the bed of a dry lake for water that could be used for drinking or cooking, as the usual result would be a strong brine of salt, soda or borax. The presumption is, therefore, that wherever a dry lake occurs in the great basin valuable layers of borax, sodas, niter or salt or brines saturated with these salines will be found below the surface.

(TO BE CONTINUED.)

WHEN locating a mining claim secure a suitable mill site, if the claim does not afford such. The question of water is also important. A mine without water is in an undesirable position for operations in the future. Where no water is obtainable, as in the desert, the mine owner must await developments, but mines in the desert are generally very good or no good at all.

## The Ore Deposits of Bisbee, Arizona.\*

NUMBER VIII.—CONCLUDED.

Written by F. L. RANSOME.

In the presence of solutions containing carbon dioxide or bicarbonates of the alkaline earths, or by direct reaction with the calcium carbonate of the gangue, the sulphates of iron and copper may be converted into carbonates, those of copper being fairly stable, while the ferrous carbonate readily undergoes a further oxidation and hydration into limonite. In this way the close association of limonite with the carbonates of copper in certain portions of the oxidized zone is in part explained. The ferric sulphate may also pass into basic sulphate and then into limonite, while the cupric sulphate may be transformed to the basic sulphate brochantite. Becquerel succeeded in producing small crystals of this mineral by keeping a fragment of porous limestone for several months in contact with a saturated solution of cupric sulphate. By the addition of sodium bicarbonate to the solution the brochantite was transformed to malachite. Brochantite is probably of common occurrence as a transitional step in the formation of malachite from the sulphate, although it does not occur in great quantity in the Bisbee mines.

The sulphuric acid which forms under certain conditions of oxidation may play a varied part in the further alteration of the ores. It may in zones of such deep and irregular oxidation as those at Bisbee come in contact with cuprite and form cupric sulphate and native copper. Or it may form various metallic sulphates, or gypsum.

With reference to the abundance of kaolin or clay in connection with the oxidized limonite ores Mr. Douglas concludes that the alumina, sometimes forming as much as 17% of the ledge matter, has been derived from the neighboring porphyry. While kaolin has undoubtedly been produced in the porphyry through the action of sulphuric acid formed from the oxidation of pyrite, upon feldspar and sericite, yet it does not appear that all, or even most of the kaolin in the oxidized ores and ledge matter, can be traced to this source. Like limonite, it is one of the common products of the oxidation of the mineralized limestones, and it is clearly a local concentration of material, which, before the oxidation of the pyrite, was more widely distributed through the rocks. If the limestones in connection with which the ores occur were noticeably shaly and argillaceous the abundance of kaolin might easily be accounted for by the action of sulphuric acid upon such beds, the acid coming, of course, from the oxidizing pyrite. The alumina would go into solution as a sulphate, and might then be transported and redeposited as kaolinite in the presence of solutions containing silica. The occurrence of the clays is such as to strongly suggest that the alumina contained in the limestones was originally a constituent of the limestones. Its concentration in the porous limonitic ledge matter has probably been effected by mechanical as well as by chemical agencies.

The conclusion that large quantities of gypsum must have been produced by the reaction of the metallic sulphate solutions with the partly calcareous gangue of the original pyritic ore seems inevitable. But no gypsum has been seen in any of the Bisbee mines. Owing to its solubility and to its chemical stability which prevents it from entering into less soluble combinations, it has probably been removed by percolating waters as fast as formed. A large amount of sulphur has been eliminated from the ore bodies by their partial oxidation, and this removal seems to be most reasonably accounted for by the supposition that it has been carried away in the form of gypsum. Mr. Douglas calls attention to the fact that in regions yet more arid than Bisbee gypsum accompanies the oxidized ores in limestone and cites the Boleo mines in Lower California. Under certain conditions, however, gypsum, resulting from the attack of sulphate solutions from oxidizing pyrite upon limestone, may not be entirely removed even in comparatively humid climates. This is shown by the occurrence of gypsum having this origin in the Logan mine at Rico, Colo.

The most marked physical effect of the oxidation of the ore bodies has been a great increase in the porosity of the masses acted upon. This, by enabling solutions to percolate easily through the partly oxidized zone, has greatly facilitated the migration and concentration of the desulphurized ores and their segregation in workable masses from the bulk of the limonitic and clayey ledge matter.

The oxidized material is not only more porous, but much softer and more plastic than the original mineralized limestone, and hence greatly weakens by its presence the rocky structure in which it occurs. The overlying limestones, no longer adequately supported, fissure and settle down upon the soft plastic ore and gangue. The access of solutions is thus still more facilitated, and the processes of oxidation and solution proceed so much the faster. That part of the surface which is underlain by oxidizing ore bodies is thus rendered less resistant to erosion, other

things being equal, than the surrounding country. This accounts for the frequent concurrence, pointed out by Mr. Douglas, of ore bodies with relatively low ground. It by no means follows, however, that because most of the known large ore bodies near Bisbee have occurred beneath topographic depressions, all low ground in the vicinity is underlain by ore, or that no ore occurs except under such hollows.

**VALUE OF THE ORES.**—The percentage of copper in the ore as mined is to a very large extent subject to direct control by those who direct mining operations. With ample facilities for extensive and economical operation, the grade of ore that can not be handled sinks lower and lower. Thus while a large mine may contain ore as rich as it did when first opened, the average tenor of the ore now worked is usually very much lower.

This almost self-evident fact is well illustrated by the Copper Queen mine. The ore first worked, early in the eighties, averaged 23% of copper. As the mine developed, as methods of treatment improved, and as transportation became less costly, the tenor of the ore was greatly reduced until the average at present is about 7%, with a range of from 4% to 20%. The minimum grade, however, is only mined when occurring with better ore, or when particularly desirable for fluxing purposes.

The average tenor of the ore from the Calumet & Arizona mine in 1902 was about 10% of copper, according to I. L. Merrill. But the stopes were then recently opened and contained some remarkably good, oxidized ore. As development progresses it will probably be found economical to reduce the average grade of the ore.

The gold ore of the Easter Sunday mine is reported to run about \$30 per ton when sorted. But as the small quantity of ore thus far produced has been accepted by the Copper Queen smelter upon the condition that the silica shall not fall below 84%, the actual tenor that the ore would show if mined and treated directly as a gold ore is unknown.

**FUTURE OF THE DISTRICT.**—Although more or less mineralization occurs at many points in the Mule mountains, there is little to indicate that any deposits of copper ore will ever be found in the Bisbee quadrangle approaching in importance those already known and those probably awaiting discovery in the faulted limestone syncline about Sacramento hill. For over twenty years the Copper Queen mine has produced an average of more than 16,000,000 pounds of copper annually. Recently the Calumet & Arizona Co. has begun energetic operations in ground almost surrounded by the property of the Copper Queen. Not only is there sufficient ore known in these mines to keep them in operation for many years to come, but there is no clear evidence that the bottom of the ore-bearing ground has been reached in any of these extensive workings. Moreover, the statement may be ventured that the specter of the lower lime has hitherto had an undue influence in restricting prospecting to nearly horizontal planes. There is certainly a reasonable hope of finding ore bodies in the Martin and Abrigo limestones beneath the masses that have been so profitably worked in the overlying Carboniferous beds. The occurrence of small bunches of ore in the Abrigo limestone at the Whitetail and Wade Hampton claims shows that ore deposition may take place in these lower beds. It may be that, owing to their greater depth, such ore bodies, if discovered, will be found to consist of low-grade cupriferous pyrite, unenriched by the generally descending solutions that have contributed so largely to the value of the known masses. This, however, is a point that prospecting alone can determine. It would seem that near the Dividend fault the conditions are favorable for the continuance of enriching processes to depths greater than those now reached in this part of the underground workings.

But more than this, it may be pointed out that less than half of the semi-circular mineralized zone about the porphyry mass of Sacramento hill has been explored at all. Ore was first discovered at the surface on Queen hill at the northwest end of the zone. From this discovery developments have been pushed by underground exploration to the south, often with little or no surface indication of ore. There still remains, however, an extensive area of unknown but promising ground, lying just south of Sacramento hill and extending eastward toward the southeastern continuation of the Dividend fault—an area which is here concealed by the Glance conglomerate. This is the eastern half of the semi-circular mineralized girdle about the intrusive mass of porphyry. While structurally the beds south of Sacramento hill form a less favorable nook for the deposition and concentration of ores than that inclosed between the Czar and Dividend faults and the northern contact of the porphyry, yet their attitude with reference to the intrusive stock, and to the continuation of the Dividend fault down Mule gulch, is distinctly favorable to mineralization. The developments in the Spray and Calumet & Arizona mines have shown that profitable ore bodies are by no means confined to the structural pocket in the vicinity of the Czar and Holbrook shafts. There is no known reason why they should not yet be found skirting the southern and southwestern contact of the porphyry, which, as recent explorations with diamond drills show, extends from the ice factory in a southeast direction for a distance

of at least 2000 feet under the Glance conglomerate.

It is true that the easterly dip of the beds southwest of the porphyry stock carries the Escabrosa limestone to a much greater depth near Mule gulch than it reaches in any of the present workings. It is probable that this depth, a short distance east of the Gardner shaft, may be so great as to preclude the occurrence within the Escabrosa limestone of any but original, unenriched pyritic ore, which may or may not be workable. But judging from surface indications there has been considerable mineralization of the Naco limestone south of Sacramento hill, and there is nothing improbable in the occurrence of high-grade ores in this limestone at stratigraphically higher horizons than those in which ore bodies have hitherto been found. The exploration of this ground calls for no greater outlay or boldness than is already displayed in other parts of the district with less reasonable hope of reward.

The outlook for finding profitable ore bodies within the main porphyry stock of Sacramento hill is not regarded as particularly promising. As the dump of the Copper King shaft shows, this rock may be very heavily impregnated with pyrite. But the mineralization seems to tend more to abundant dissemination than to the formation of solid sulphide masses. Even if the latter occur, it is doubtful whether they would be found sufficiently cupriferous to constitute ore. Moreover, the chemical and physical character of the porphyry renders it very much less favorable than the limestones to the deep oxidation and secondary concentration that has played so important a part in the genesis of the known ore bodies. Very little exploration of the porphyry has been made, however, and work in this direction cannot be condemned as altogether vain.

In conclusion, it may be said that Bisbee is less likely to suffer from a lack of ore than from too rapid exhaustion of those high-grade oxidized ores which are necessary for the economical smelting, by present processes, of the low-grade sulphides.

## An Injector Condenser.

One of the simplest forms of a condensing engine is

that fitted with the injector condenser. The accompanying cut shows a condenser of this type. A is the steam pipe; B, the stop valve; C, the exhaust pipe; E, the annular head into which the condensing water is thrown through the pipe, G, and by the arrangement of which the water is formed into a sheet; F F shows the two inverted nozzles through which the condensing water escapes into the hot well H. The method of operation of the injector condenser when the engine starts is as follows: The exhaust steam expels the air from the exhaust pipe and condenser; then a jet of cold water from a pump or tank creates a vacuum, which may be maintained by a head of water of 10 feet fall.

## Jumping Up Iron for Welding.

The illustration shows an anvil tool which will be found useful in upsetting iron for welding. Slightly

point the end which is to be jumped up and drive it into the tool. In this way the iron is jumped up a little way back from the point, where it is actually wanted, and saves time and labor hammering down the burr which forms when it is done in the usual way on the face of the anvil; besides, it is much easier to scarf. Another idea sometimes adopted when welding axles or similar work is to get a strong ring which will just fit over the end to be jumped up. Place the ring, cold, on the anvil, and drive the heated end into it and jump up with the ring on. The ring will prevent the iron spreading at the bottom.

TOWERS for aerial tramways may be built as high as the economics of construction will admit. The expense is always to be considered.

\*Abstract Professional Paper No. 21, U. S. G. S.

## Cyaniding in the Black Hills.

Written by J. T. MILLIKEN.

The cyanide process has done much toward the development of the gold mining industry in the Black Hills of South Dakota. Fifteen years ago the ores now successfully treated by the cyanide and chlorination processes had resisted every attempt, up to that time, made to recover a payable percentage of their values, by every method tried except smelting, which was generally too expensive for the low-grade ores, though thousands of tons of rich ore had been shipped to Denver, Colo., Omaha, Neb., and elsewhere for treatment. Following is an abstract from the Black Hills Mining Review of a paper recently read before the Black Hills Mining Men's Association, showing how the cyanide process has made a simple matter out of a most perplexing problem of the metallurgy in the Black Hills. Both wet and dry crushing are employed in the operation of the cyanide process in the Hills. The two large concerns which employ the dry method are the Golden Reward and the Imperial companies. The description of process following is that practiced at the Imperial, of which J. T. Milliken is superintendent:

The ore being treated at the Imperial is from the potsgam, is extremely hard, close grained and highly siliceous, and the gold is minutely disseminated. Eighty-five per cent as it comes from the mine is fairly oxidized, the remainder being a blue unoxidized ore. The latter is very refractory, close grained, and contains from 4% to 5% iron pyrites, traces of arsenic as arsenopyrite and antimony. The blue ore makes it difficult to recover 75% from the low-grade ores of the Black Hills, but as the two ores are mixed together it is impossible to effectually separate them.

The Imperial mill occupies a flat site, each department having its own building independent of the mill proper, which form of construction affords perfect control of the dust and confines it to the building wherein it is produced. The engine room and the leaching and precipitating department are separate from the crushing department, which is the only department where dust is produced.

Ore is received from the mines over the Burlington and Northwestern railroads and dumped into railroad bins, from which it is drawn into a large crusher, the discharge of which feeds into a bucket elevator, by which the ore is conveyed to a rotary screen for sizing. The oversize returns to rolls, and the undersize is carried by a belt conveyor to storage bins whose capacity aggregates 1000 tons. The discharge from the rolls joins the feed from the crusher and is again elevated to the sizing screens, so that only the carefully sized material goes to the storage bins. Here the sampling is accomplished. The samples are cut from the sized ore as it leaves the screen by a fine automatic sampler. The cut is one-twenty-fifth of the whole, which is spouted to a steel-covered floor and is again reduced by a sampler, run through a pair of sampling rolls, undergoes further reduction, is thoroughly dried, finally ground in a sample grinder to about 80 mesh, is thoroughly mixed, cut with a riffle to about 10 ounces, bucked through a 120-mesh screen, and two samples are taken. The superintendent explains that the thoroughness with which sampling is practiced at this mill is of great value for giving reliable figures.

The ore is then fed by an automatic fine-ore feeder onto a belt conveyor, thence discharged into a bucket elevator and deposited into a dryer. The temperature maintained in this dryer is close to 300° F., the object being to dehydrate the ore, by which the percolation of solution in the cyanide vats is assisted.

From the dryer the ore is discharged into a roller-chain continuous bucket elevator, by which it is conveyed to a cylindrical screen. The over size passes to rolls and joins the feed from the dryer, and is again elevated and sized. The under size passes to the finishing rolls.

The finished pulp is fed onto a screw conveyor, and at this point is sprayed with a cyanide solution to minimize the dust in the leaching room. The screw conveyor discharges onto a belt conveyor, and the ore is thence elevated to another belt conveyor, passing over the leaching vats, by which means all the vats are filled.

There are four leaching vats, each 6 feet deep, 35 feet in diameter, and built of  $\frac{3}{8}$ -inch steel, and when filled hold about 275 tons of ore. In filling the vats the ore is charged in a standardized solution, five pounds of cyanide to a ton of water (0.25%), and when the vat is filled the mass is saturated. After the filling the surface is covered with standard solution and the charge allowed to stand until perfectly quiet and thoroughly saturated. Leaching then begins and continuous percolation continues until the charge is washed. The time required to fill a vat is fifty hours, and treatment averages eight days.

Practically six-tenths of a ton of solution is used to each ton of ore treated. Larger amounts of the solution have been used, as much as 2000 pounds, and weak and strong solutions have been returned to the vat without any apparent increase in extraction, and amounts as little as 600 pounds of solution to the

ton of ore have given the same tailings as when the normal 1200 pounds per ton of ore has been passed through the charge.

The vats are provided with the usual filter grating, covered with cocoa matting and eight-ounce duck, and 8-inch diameter sluicing gates, one in the center and one in each quadrant. Sluicing is accomplished with hydraulic pressure.

In the precipitation department there are two gold-storage tanks, 4 feet deep and 20 feet in diameter, built of  $\frac{3}{4}$ -inch steel. These are for the effluent and weak solutions. There are two sumps under the zinc boxes the same size as the gold storage, and two double-compartment zinc boxes with fourteen chambers, 2 feet square and 2 feet deep in each compartment, making twenty-eight in all. These hold when closely packed fifty-five pounds each of lathe-turned zinc.

The zinc area required for precipitating the values from 130 tons of ore per day is 104 cubic feet, containing from 700 to 1000 pounds of zinc shavings. Solutions are standardized by pumping from sumps into two tanks, each 16 feet deep and 14 feet in diameter.

In the Imperial mill the sands and slimes are treated without separation. The amount of gold solution passing through the zinc boxes is readily measured, constantly sampled and checked with the total solution returned from sumps, and with the drip samples taken on each tank continuously during leaching, including washing. This extraction, compared with the extraction figured on the difference between the control and tailings samples, is about 1.4% higher. The total bullion return checks with the solution extraction within 1.5%, the total bullion return being 1.5% higher. The total bullion returns since the mill was started was 78.76%.

The operating cost per ton of ore for the last running twelve months, based on a daily tonnage of 100 tons, is as follows: Labor, \$.58; fuel for power, \$.225; fuel for drying, \$.110; lubricants, \$.051; roll steel, \$.057; equipment supplies, \$.045; cyanide, \$.120; zinc, \$.050; melting supplies, \$.014; assaying supplies, \$.015; miscellaneous supplies, \$.040; insurance, \$.030; this means a total cost per ton of \$1.367 for milling. A daily tonnage of 130 tons for twenty-four hours is maintained. Certain improvements are contemplated at the plant which, when completed, will still further reduce the cost of operating.

The usual sulphuric acid method of cleaning up is used. Owing to the small amount of solution and its freedom from slimes, the precipitates are high grade and in excellent state for dissolution with the acid. The bullion for the last six months has averaged 935.7 fine. The average time of clean-up is eighteen hours. The slimes are dried during the night, melting starts in the morning, and two men carry out the work. The average cost per ounce of bullion recovered is 8.3 cents. During the month of July 2554.4 ounces of bullion were recovered, at an average cost of 7.1 cents per ounce. The bullion for the last four months has averaged 504.5 silver and 431.2 gold.

Mr. Milliken makes some interesting comparisons between the fine wet-crushing plants and the dry-crushing plants. The principal drawback to the dry-crushing plant is the dust; but this, the author thinks, has been greatly magnified by popular talk. With the present improvements for handling dust and a mill designed for confining it to the department where it is produced, a dry-crushing mill is not a bad place to work, and there will be no difficulty in keeping men.

Another point that has been argued against fine dry crushing is the loss of values in the escaping dust. Mr. Milliken says there is a loss in values by escaping dust, but there is also a loss in dissolving gold in the wet-crushing process which exceeds anything he has ever seen in dry-crushing plants.

In making his comparisons between the loss of gold in slimes and the loss of gold in dust, Mr. Milliken bases his returns upon results and information derived from Mr. Gross, the superintendent of the Penobscot mill, as that mill is one of the most modern wet-crushing plants in the Black Hills, and great care is being taken to reach accurate results.

Mr. Milliken also compares the various items of cost at the Penobscot mill with similar or corresponding items at the Imperial, and presents some interesting figures.

In conclusion, he says a wet-crushing mill is much simpler in construction, having fewer pulleys and belts, and generally only one elevator, and no screens except the battery screens. The cost of construction will be practically the same in mills designed to treat similar ores. The wet-crushing plants are more cleanly and more easily kept so.

On the other hand, in the scope or elasticity of the processes the wet crushing is limited in many ways. It is not an unusual difficulty for an ore running high in values to produce a large percentage in slimes, which carry values exceeding the original, or heads, by 150% to 200%. A very unusual characteristic of gold ores, and one that makes the low-grade ores of the Black Hills particularly applicable to wet crushing, is the fact that the slimes carry less values than the sands or the ore from which they are separated.

On 95% of the low-grade mines the blue or unoxidized ore is developing very rapidly, and at no distant time the mills will have to resort to roasting and cyaniding, and all the ores that have been exper-

imented upon will have to be crushed to at least twelve mesh, though sixteen or twenty mesh have given the better results.

## Permanent Irrigation Structures.

In the course of a report as consulting hydraulic engineer of the Turlock, Cal., Irrigation District, Prof. S. Fortier makes a contrast between the cost and desirability of pipe lines and of flumes and trestles which will be interesting to all who are carrying water over low places:

**FLUMES ON HIGH TRESTLES.**—There are two flumes on high trestles on the upper portion of the main canal. The upper one is 300 feet between approaches, and the bottom of the flume is 60 feet above the surface of the water in the creek. The second is 514 feet long and 61 feet high.

Both of these flumes are in a dangerous condition and liable to collapse at any time under a full head. If it is intended to increase the capacity of the canal to 600 cubic feet per second, next year, both crossings should be renewed this fall. In reaching conclusions as to the best means of providing a suitable crossing in each case, several types of structure have been considered.

**INVERTED PIPE SIPHONS.**—The idea of siphoning the flow of the canal under these deep ravines has not received the consideration which its merits deserve, and the attention of the members of the board is called to the following facts: In the use of pipes for the crossings, three sizes have been considered—6 feet, 7 feet and 8 feet internal diameter, respectively. The largest size would be the cheapest, but the 6-foot pipe would prove the most satisfactory. I have accordingly adopted the smaller size throughout. The surveys show that there is ample fall in both cases to provide a mean velocity of over 10 feet per second. That is probably as high as it is safe to go. In the estimates submitted it will be observed that in the case of both wooden and steel pipes figures are given for three lines of 6-foot pipe and also for five lines. The capacity of the former in round numbers would be 900 cubic feet per second and of the latter 1500 cubic feet per second.

**REDWOOD STAVE PIPE.**—The estimates are based on the use of dark, heavy redwood, bound by steel bands and well protected from corrosion. Both approaches are to consist of cement concrete flumes, and the ends of the pipes are to be embedded in asphalt concrete. The necessary blow-offs and angles are included.

**STEEL PIPES.**—The shell of these 6-foot pipes is to be  $\frac{5}{16}$  of an inch in thickness and made from a fine quality of open-hearth steel. The approaches are of concrete and each pipe is to be thoroughly coated before being laid and afterwards embedded in a 3-inch layer of asphalt concrete. By keeping the insides painted from time to time, corrosion will be impossible.

**WOODEN FLUMES ON WOODEN TRESTLES.**—The trestles rest on concrete piers, and the approaches, which are usually the first to decay, are to consist of concrete flumes.

**WOODEN FLUMES ON STEEL TRESTLES.**—This type comprises steel trestles on concrete foundations, a wooden box of good redwood and concrete approaches.

**ALL-STEEL FLUMES.**—In this both trestles and flumes are of steel and rest on concrete masonry foundations.

It may be well to add, in connection with flumes, that in all the various types mentioned the width is designed to be 20 feet and the depth of water 8 feet. On the given grade this size of flume would carry about 1500 cubic feet per second.

**MORGAN RAVINE CROSSING.**—Estimated cost of each of five different types of structures to replace the present Morgan flume:

Redwood pipes, 6 ft. diameter, three lines.....	\$11,000
Redwood pipes, 6 ft. diameter, five lines.....	17,500
Steel pipes, 6 ft. diameter, three lines.....	21,000
Steel pipes, 6 ft. diameter, five lines.....	31,750
Wooden flume and trestles.....	18,500
Wooden flume and steel trestles.....	31,500
All-steel flume and trestles.....	40,500

**PEASLEE RIVER CROSSING.**—Estimated cost of each of five different kinds of structures to replace the present Peaslee flume:

Redwood pipes, 6 ft. diameter, three lines.....	\$14,000
Redwood pipes, 6 ft. diameter, five lines.....	21,250
Steel pipes, 6 ft. diameter, three lines.....	24,400
Steel pipes, 6 ft. diameter, five lines.....	39,000
Wooden flume and trestles.....	22,500
Wooden flume and steel trestles.....	40,000
All-steel flumes and trestles.....	47,250

**COMPARISON OF COSTS.**—In reviewing the foregoing figures on the cost of the different structures, I would recommend the use of steel pipes laid in the manner indicated. In my judgment, these steel pipes would outlast an all-steel flume and trestle structure and cost less for maintenance and repairs. It will also be observed that, on the basis of a full head for both kinds of structures, there is a saving of \$17,000 in first cost in favor of steel pipes. This maximum capacity, however, will not be required for many years to come—possibly not until 1920—and in the meantime fewer lines of 6-foot piping would suffice. A new line might

be added at any time when the demand for water required an additional supply. Comparing the cost of three lines of pipe, which would give a discharge sufficient for several years to come, with an all-steel flume, there is a saving of \$41,850.

For similar reasons I would prefer the use of redwood stave pipes to wooden flumes on high pine trestles. From an eighteen years' experience in the construction and use of redwood stave pipes, I have no hesitancy in stating that the wooden pipes would last much longer than the wooden flumes on pine trestles.

Of the various types of structures named, there remains but the redwood flume on steel trestles. Since the cost of this combination is about equal to steam pipes, I would again express a preference for the latter. There is no question, I think, but that the redwood box would require to be renewed several times during the life of the steel pipes, providing, of course, that the exterior and interior surfaces of the latter are thoroughly protected from corrosion. By embedding the exterior surface in asphalt concrete and applying frequent coatings of paint to the interior, it is believed that the metal can be kept entirely free from rust.

### Combined Water and Fire Tube Boilers.

The Simmons boiler illustrated herewith consists of an upper fire tube section similar in construction to the ordinary horizontal fire tube boiler and a lower inclined water tube section, the front header of which is directly attached to the fire tube section, while the rear header is connected to it by a suitable elbow. This construction permits of a continuous waterway or circulation from the fire tube section through the elbow to the rear header of the water tube section, thence through the inclined water tubes to the front header and through this to the fire tube section.

The furnace is located at the front, under the water tube section, and the flames and heated gases, traveling in an opposite direction to the flow of the water, pass to the rear over and around the water tubes and thence through the fire tubes to the front, where they discharge into the stack or smoke flue. Owing to the distance through which they pass in their course through the boiler and the large area of heat-absorbing surface to which they are exposed, the gases are discharged into the stack at a low temperature and resulting fuel economy follows. No tiling over the tubes or cross-deflecting tiles are used

Front End of Boiler Showing Hand Hole Plates and Crow Feet Covering Water Tubes.

Side View of Boiler Showing Water Section Partly Tubed

Complete Boiler With Water and Fire Tube Sections.

for the purpose of deflecting the flames, collection of soot and unequal action of the heat on the tubes common to boilers in which these tiles are used being avoided. The makers say:

"A peculiar feature of this invention is its adaptability to plants of fire tube boilers already installed which lack the required steaming capacity, for the water tube sections can be attached to these fire tube sections and the heating surface, and consequently the capacity increased to meet the requirements without increasing the floor space occupied by the boiler plant.

"Such an installation was made early in 1903 at the Buffalo Brewing Co.'s plant at Sacramento, Cal., where three 66-inch by 16-foot horizontal fire tube boilers, which had been in operation for about ten years, were found to be inadequate to the requirements and it was determined to attach the water tube sections to them and thereby practically double their capacity.

"Owing to the fact that it was necessary to keep the plant in operation, but one unit could be changed at a time. The first was, therefore, disconnected from the steam header and moved forward a slight distance to enable the workmen to attach the Simmons water tube section containing 1000 square feet of heating surface, after which change it was moved back to place, bricked in, connected and put in service. The other two boilers were changed in the same manner and when the work was completed the capacity of the plant had been increased from 300 to 600 H. P.

"The original plant occupied a floor space 22 feet

Front With Breaching and Fire Doors Open.

long, 27 feet wide and 11 feet high, while the remodeled plant of double the capacity occupied exactly the same floor space, but was 1 foot higher. The

illustrations show this interesting work in progress.

"In March, 1903, a series of tests was conducted at this plant, which showed an evaporation per square foot of heating surface from and at 212° F. per hour of 3.63 pounds, an evaporation per pound of oil per hour from and at 212° F. of 14.3 pounds, and an efficiency of 72.72%.

"The efficiency was based on the heat absorbed by the boiler as represented by the water evaporated into dry steam from and at 212° F. per pound of oil compared with the heat value of the oil per pound, proper correction for the moisture in the oil being made.

"When it is considered that the boilers tested had been in service for a number of years, and that there was no special preparation for the test, the results obtained were very satisfactory and the tests demonstrated that these results would have been materially improved if the length of the furnace and the distance between the lower row of tubes of the water tube section and the top of the grates were increased, as this would have resulted in a better combustion and consequent increased evaporation.

From observations made during the test, the water level was shown to be maintained very uniform, the range being from 4½ inches maximum to 2 inches minimum, while the drop in the water level when the fires were put out was found not to exceed 1½ inch. The quality of the steam showed a very small percentage of moisture, the maximum being 1.5% and the minimum .44%.

"In a modified form the Simmons combined fire and water tube boiler is well adapted to marine ser-

vice, combining, as it does, the good features of the water tube type of boiler with the large steam separating space of the Scotch marine type. It has the additional advantage of being light and compact, having from 2 to 2½ feet of heating surface for each cubic foot of space which it occupies, while its weight is about one-half of that of the Scotch boiler of equal capacity."

The sale of this boiler is controlled by Harron, Rickard & McCone, 21-23 Fremont street, San Francisco, Cal., from whom further information in reference to it can be obtained by any one interested.

Simple Drawing Board Attachment.

A simple attachment for a drawing board may not be an original idea, but is very serviceable. The attachment, herewith illustrated, is easily constructed.

Attach a spring A to the top of the drawing board, then attach a piece of strong twine to the opposite end of spring; next pass it around both corners of the board having it perfectly tight, and fasten at the lower edge by means of a screw eye. Put a round-head screw B in the under side of the T-square head and insert twine in rear of the screw; the tension of the spring will then hold the head of the square against the edge of the board C, and many mistakes will be prevented, as the T-square is always true.

Dangers of Shaft Sinking.

TO THE EDITOR:—It is possible that your readers may be misled by your editorial of September 3rd, on the Argonaut accident. From reports and actual tests, the management knew the fuse to be of the first quality before sending it into the mine. It is not thought, by those familiar with the conditions surrounding the accident, that the quality of the fuse caused in any way the premature explosion. The fuse is of foreign manufacture and is being rapidly introduced here for reasons which concern all local users of explosives.

Generally speaking, the California mines have been using California fuse. A few months ago the California fuse manufacturers combined, with the result that the price of fuse went up, and the quality went down. Since that time four or five mines in this vicinity have begun using imported fuse, and no doubt many others will follow. The "trust" did not notify us when they increased the burning speed of their fuse, and had it not been that we made a practice of testing new lots, there might have resulted a serious accident. This is the point on which your editorial touches, and we heartily agree with you that it is the proper thing to do under existing conditions; but these conditions should be changed so as to have all fuse tested in the factory.

ARTHUR GOODALL,  
Manager Fremont Con. M. Co.

Drytown, Cal., Sept. 4.

The above comment on the recent accident in a California mine is timely, and seems an occasion for the reiteration of what was previously said herein in relation to the above-mentioned distressing accident. There is probably no branch of practical mining in which lurks so many dangers as shaft sinking. There are dangers from above, owing to the possibility of a skip bucket or cage getting beyond control of the engineer and suddenly dashing down the shaft upon the men working in the bottom. There is danger of falling pieces of rock and ore, and the tools and other objects carelessly dropped into the shaft from above; there is danger after spitting the fuse of a premature explosion, as exemplified in the Argonaut case, and danger still lingers, after the shots are "gone," of drilling or picking the next shift, into a cut-off hole. If the accident at the Argonaut mine was not really due to a length of defective fuse, the cause of the disaster will never be learned. The suggestion of the correspondent above, that the fuse be tested in the factory, is eminently correct, but it does not relieve

the mine superintendent of the necessity of testing fuse for his own knowledge and satisfaction. It should be the inflexible rule of every mine that any irregularity in the burning time of fuse be promptly reported to the superintendent. It is unsafe to relax vigilance in this direction.

Electrical Precipitation in Montana.

NUMBER III—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by  
MATT. W. ALDERSON.

Each plate is painted on the positive side with graphite in linseed oil. The oil would interfere with the passage of the current, so plates are baked to temperature of 260° C to drive off the oil. Before the graphite was used iron plates without coating were employed, but they were attacked by the solution to such an extent that in a few months they looked like a lace curtain. With the coating of graphite on the positive side there is no appreciable corrosion or breaking up, and the plates after months of service are practically the same as new.

As a general rule in electrical precipitation, the lower the current the more metallic the precipitation, and the higher the current the more mossy or granular. With the solutions at the Butters plant the metals fall to the bottom of the precipitation boxes as a fine powder, but with the solutions at Empire, using as high as two amperes to the square foot, one cannot throw down the bullion as a precipitate; it forms as an adhesive coating on the plates. The amount of this coating depends, of course, on the amount of solution that has been handled. Generally about 4000 tons are treated in each box before a clean-up. Then the coating will come off in flakes, many of which will be as much as a foot across. The plates each strip off from seven to seven and a half pounds of bullion at a clean-up, the bullion averaging about \$1.50 a pound before melting. This bullion has been shipped by express to refineries East, but plans have been made for a furnace in which the bullion will be melted, thus reducing the quantity one-half, and,

The Malm Electrolytic Cyanide Plant, Marysville, Mont.

as the product will be in bars of about 500 pounds each, they may be shipped by freight, thus reducing transportation charges to one-sixth present cost.

The excellence of the work done is best shown by an analysis of the product. This, made as a smelter would make it—for base metals only—shows the following average of several clean-ups:

Copper.....	51.2
Lime.....	13.4
Iron and aluminum oxides.....	7.3
Arsenic and antimony.....	6.7
Lead.....	3.3
Gold and silver.....	3.2
Total.....	85.1

This, it is to be understood, is not a complete analysis, but one for the straight metals only. No other common base metals are found, so it is taken for granted the remaining 15% are various oxides. In the light of the above one may form something of an idea of what an enormous load of base products the solutions would soon carry if they were not removed. The recovery of copper is about 800 pounds a day, or 1.6 pounds to each ton of tailings. A surprising feature is that the bullion sometimes shows as high as 6% lead, a substance very sparingly soluble in cyanide solutions. This lead is in the ore as carbonate, and a small quantity of it is taken into solution and saved in the precipitate.

The cost sheet for the present year shows cost of loading: Labor and supplies \$.021, power \$.025 = \$.046. Previous cost for this was: Labor and supplies \$.072, power \$.045 = \$.117. Other costs are as follows: Cyanide \$.104, lime \$.016, precipitation and clean-up \$.03, pumping \$.03, sluicing out \$.006, re-

pairs \$.011, miscellaneous \$.036; total, \$.029 per ton of tailings treated. These figures do not include interest on investment or anything for redemption fund, but are working costs only. As such they give a clear idea of the economy of the operations.

Weighing Without Weights.

A device for weighing without weights on button balances has been invented and patented by F. W. Thompson, 1717 Arapahoe St., Denver, Colo., to be accomplished by the use of riders, as shown in the engraving herewith.

Weighing Without Weights.

"These riders, when not in use, are suspended from a multiple rider carrier, mounted to move parallel with the horizontal part of the hanger, and to rotate in either direction so as to bring any desired rider in position to be placed on the hanger (not on the beam) as occasion may require, the same as weights are placed in the pan by hand. All the riders may be placed on the hanger for a single weighing, if necessary. Each rider has a peculiar bend for the purpose of designating its weight, and each arm of the carrier is numbered to correspond to the weight of the rider it is to carry. The object of this invention is to do away with the handling of small weights by hand or with the tweezers."

The manufacturer claims that by using these riders

it saves the assayer time over the old method of using weights. The riders are all in plain sight along the wire and the result is obtained at a glance. There is no opening and closing of the balance door for the purpose of changing weights, which sets up air currents and requires a few seconds' wait for it to subside.

THE PROSPECTOR.

The rock specimen from Temescaltepec, Mexico, is diorite, with infiltrated veinlets of quartz.

The rock from Amalie, Kern county, Cal., is metamorphic, probably altered, diorite, and is now practically a granular quartz rock with disseminated iron sulphide.

The rock samples from San Jose, Cal., are: No. 1, a metamorphic sandstone, showing a few small grains of cinnabar; No. 2 is serpentine; No. 3 is the metamorphic slate-like rock called alta by the miners. It probably forms the wall of a vein or fissure.

The several mineral specimens from Trinity county, Cal., have been identified as follows: No. 1, pyroxene, with quartz veinlets; No. 2, diorite porphyrite (not typical). No. 3, an intrusive rock, altered and containing much calcium carbonate and finely disseminated pyrite; No. 4 is diabase; No. 5, diorite; No. 6, diabase, and No. 7, diorite.

# Mining and Metallurgical Patents.

PATENTS ISSUED AUGUST 30, 1904.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

ROCK DRILL.—No. 768,894; Henry Deitz, Denver, Colo.

In drill, combination of casing having central guide-way and longitudinal guideway located laterally of central guideway, drill holder mounted to reciprocate in central guideway, tool-actuating part located laterally with relation to drill holder and bifurcated to straddle latter, projection extending from tool-actuating yoke and fitting in lateral longitudinal guideway to be limited thereby to movement in path parallel to that of drill holder, suitable bearings mounted on drill holder on opposite sides of bifurcated yoke portion, and suitable means for reciprocating yoke.

TOOL FOR MAKING DEEP WELLS.—No. 769,080; C. M. Heeter, Butler, Pa.

Drilling tool for deep wells having sides recessed to afford shoulders for engagement with fishing tool; recess having converging guiding sides, and longitudinal groove for reception of hook of fishing tool.

EXCAVATING MACHINE.—No. 769,105; A. McCarthy, New Orleans, La.

In excavating machine, combination with suitable movable support, of endless flexible means rotatably carried by movable support, transverse plates carried by flexible means, plurality of picks affixed to transverse plates, plurality of movable scoops located in rear of picks and carried by movable support.

port, and means for conjointly operating flexible means and scoops and feeding movable support forward during operation.

SKIP CAR OR HOIST FOR BLAST FURNACES.—No. 768,208; S. W. Vaughn and J. B. McClure, Lorain, and A. J. Boynton, Elyria, O.

In skip car, combination with bucket having centrally opening valve consisting of pivoted sections, and circularly movable annulus to which sections are connected, of sliding bar on furnace top arranged to engage annulus, and means for operating bar.

APPARATUS FOR RECOVERING VALUES FROM SAND OR DIRT.—No. 768,624; C. M. Poppenberg, Brainerd, Minn.

In apparatus for recovering values from sand and dirt, combination of casing, plurality of quicksilver holders arranged one above the other, and having depressions provided with sharp edges, and spaces between the depressions for downward passage of sand or dirt, means for supporting the holders in casing in such manner that spaces are formed between the sides of the holders and casing for downward passage of sand or dirt, and deflectors arranged below upper holders so as to receive sand or dirt from spaces and conduct same to next lower holder.

STAMP MILL. No. 768,844; J. Cable, Chicago, Ill.

Stamp mill comprising mortar bed, gravity-acting stamp, means for lifting stamp from one side of bed only and releasing stamp, whereby it drops by gravity upon material on mortar bed, and means for

shifting stamp while bearing on such material from side of bed at which it drops to opposite side of bed and for returning it, whereby stamp is shifted in complete to-and-fro traverse in contact with such material between each drop and lift thereof.

MINE GATE.—No. 768,653; J. P. Cowing, Cleveland, Ohio.

Combination with trolley wire and car rails, of depressible rails carried by car rails, gate frame mounted adjacent rails and supporting trolley wire, rotatably mounted curtain carried in frame, contact member mounted near base of frame, means actuated by depressible rails being electrically connected with car rails adapted to contact with member upon depressing depressible rails, and electrically operated means in circuit with trolley wire adapted to raise curtain upon depression of last named rails.

ROASTING FURNACE.—No. 768,748; O. Hofmann, Argentine, Kans.

In roasting furnace combination of hollow shaft provided with openings at roasting shelves, sleeves fitting openings and provided with flanges, and bolts for connecting flanges to shaft, bolts being provided with nuts at one end and with wings at opposite end adapted to interlock with shaft.

CONSTRUCTION OF FROZEN WALLS FOR SHAFTS IN MINES.—No. 768,774; K. Schmidt, Erkelenz, Germany.

Improved means for forming frozen walls for shafts embracing plurality of overlapping groups, each composed of connected freezing-tubes, and freezing medium conveyed through groups.

ASSAY BALANCE.—No. 768,829; F. W. Thompson, Denver, Colo.

In balance of class described, combination with balance beam, of hanger connected therewith and provided with horizontal part adapted to hold riders used as weights, and rider carrier mounted in suitable proximity to horizontal part, carrier being provided with rider-holding pins and being revoluble and longitudinally movable.

# Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE MINING AND SCIENTIFIC PRESS.

## ALASKA.

Manager R. W. Simmons of the Alaska C. Co., operating near Coppermount, on Prince of Wales Island, reports work progressing on the smelter. A 200-ton furnace is being built.

Two more ditch systems are being constructed at Nome this summer. The larger is that of the Champion M. & T. Co., of which T. A. Champion is manager. It will comprise nearly 40 miles of ditches, being designed to bring water to every foot of gold-bearing ground on Nome and Snake rivers and their tributaries.

## ARIZONA.

### Gila County.

The Old Dominion C. M. & S. Co. at Globe reports tearing down the old smelter under way. The new smelter is nearing completion, although there is still considerable work to be done before the furnaces can be blown in. It is expected to start by September 20th. The washouts on the G. V., G. & N. railroad caused a delay in getting machinery and material needed to finish the work. There is considerable track to be laid about the smelter. Grading is under way south of the smelter building for the main track running parallel with the present track, which is to be used as a switch to the old coke and ore bins. The new ore bins are finished and also the trestle connecting them with the feed floor of the smelter building. The recent heavy rains interfered only slightly with surface work, the most serious result being the caving from the surface of the mine workings near the open cut east of the old shaft. The bottom of the gulch fell out and considerable water from the surface found its way into the mine. To prevent flooding in the future the break in the gulch has been flumed. Work has been progressing on the steel ore bins at the new shaft. Up to July 1 the Old Dominion company had spent \$708,305 on its plant at Globe, and expects to complete its new work within a total of \$900,000. The management is charging all new underground work, including the sinking of the new shaft, against the cost of its copper—a matter of between \$6000 and \$10,000 per month. The converter plant will not be completed until late in the fall.

H. Terrill, in charge of the Cowboy, Gladys and other gold claims at Dripping Springs, near Troy, for Oklahoma men, says development has reached depth where he will equip the mine with machinery, including a hoist.

### Graham County.

The Home C. Co. has sold to J. Molder ten of its gold claims, being the Buzzard's Shadow group in the Copper mountain district, 3 miles from Morenci. Molder intends to drive the Lillian tunnel through the mountain. The tunnel is in 300 feet and in a body of low-grade free milling ore which runs \$4 per ton. He also will continue sinking the shaft on the Buzzard Roost claim. The Home C. Co. is sinking its shaft on the Hobson claim with W. Jenkins as superintendent. The wagon road has been finished to the mine.

Manager Potter of the Sierra de Oro mine, near Clifton, reports a strike made in running a crosscut tunnel. The tunnel is in 800 feet, and has cut the fourth lead, which is 4 feet wide and carries values of \$70 in gold and 6% lead. This lead was cut at a depth of 462 feet from the surface. The tunnel is being driven to cut two large veins which outcrop on the surface, and which will be reached in 300 and 600 feet from present face of tunnel. In addition to finding ore the tunnel is also making enough water to run a plant, which will be placed at the mouth of the tunnel, and cost of transportation of ore reduced, says the Clifton-Morenci Mining Bureau.

### Maricopa County.

F. Webb, at Bismuthville, 16 miles from Phoenix, on the McDowell road, says the reduction works of his bismuth mine is turning out two tons per week, and the ore carries 10% bismuth. The reduction plant uses a leaching process. The ores are first ground fine, then run through a series of tanks holding 500 pounds each, in which is placed the leaching solution. Webb estimates it costs 10 cents a pound to reduce the ores to a sub-chloride powder, ready for shipment to the refinery. He expects to enlarge the plant. The mine is 10 miles from the plant, which, to get water, is near Evergreen, on the canal.

### Mohave County.

(Special Correspondence).—The development of the 500 level in the Gold Roads property shows the vein to be larger and

as good a grade as that developed above. The metallurgical operations have not been wholly satisfactory and the company is considering the making of radical changes in treatment, among which is the substitution of wet for dry crushing. It is thought the result will be a higher saving of values at decreased expense.

Acme, Sept. 5.

W. J. Cleeland of Kingman, part owner of the mines of the Philadelphia & Arizona M. Co., at Chloride, reports development being increased, and more men will be put to work. Equipment will also be increased.

Men are at work on the Enterprise mine at Stockton Hill, and it is reported a steam hoisting plant will be put up on the main shaft. W. A. Mensch is manager.

E. Hilty, part owner of the Hilty-Anderson mines, in the Gold Roads section, near Acme, says development will be resumed.

### Pinal County.

The Troy-Manhattan C. M. Co., at Troy, reports work proceeding at the Davis shaft, where the discovery of wolfeite is being opened up. The concentrating machinery to treat the product is being set up. Work is going on in the Queen tunnel on a raise to meet the Alice shaft.

### Santa Cruz County.

In Mansfield gulch, Tyndall district, Santa Rita mountains, near Nogales, E. W. Rolfe and M. Stetson report finding ore values 2½ miles northeast from Joplin group of mines, and 1½ miles east from Presidential group. The discovery shaft is sinking on the Ruby. There is a 9-foot ledge showing sulphide of copper ores assaying 12% copper, 18 ounces silver and \$4 per ton gold. It will be developed.

Work is progressing in the Joplin mines, in the Tyndall mining district, Santa Rita mountains, near Nogales. The ore body is being opened up. The Joplin is bonded to E. C. Mallette, of the Springfield-Arizona Co., for \$20,000.

### Yavapai County.

E. F. Cullerton of Chicago, Ill., part owner of the Kinney group of mines near Prescott, says hoisting machinery will be put in.

The New Idea G. M. & M. Co. has been incorporated to work Childers' mines at Turkey, 38 miles southeast of Prescott, on the Prescott & Eastern Railroad. The incorporators are E. Cosgrove, A. S. Goodell, J. Agee, W. F. Lorenz, W. R. Orr and T. M. Childers of Silver City, N. M. The last named is manager.

The United Verde mine, at Jerome, is increasing its output. The company has re-equipped the main shaft, affording added hoisting facilities. The smelter is also being improved. Two of the 250-ton furnaces have been replaced by furnaces of 500 tons capacity each. A third furnace of the same size will also be built. A dust chamber is in course of construction. The ore taken from the United Verde mine is largely sulphides, requiring no concentration, and is heap-roasted before smelting. C. W. Clark is general manager.

### Yuma County.

C. H. Gray, of Prescott, owner of the Arica mines, 45 miles northwest of Ehrenberg, reports he will reopen the group. There is one shaft 130 feet deep and another 150 feet. Gray proposes to continue sinking the deeper shaft.

## CALIFORNIA.

### Calaveras County.

The Parnell mine at Smith's Flat, near Angels, has been bonded to M. Voinich et al. for \$10,000. Work will be started this month and the mine opened up.

G. C. Turner of Stockton, president of the Voinich M. Co., reports work progressing on the company's mines on Bear mountain, west of Angels. The outside work consists in the main of surveying and building a ditch course from Greenhorn gulch to convey the water to the Voinich mine. The company will get pressure of 260 feet head, which will run machinery at the mine. The company has a 10-stamp milling plant which will be set up. Sinking the shaft continues, the depth being 600 feet. They will cut a station and prepare for opening of stopes.

### El Dorado County.

The Franklin gravel mine, near Placerville, has been sold to D. H. Jackson and Eastern men. H. C. Plummer will have charge. A barrel-mill to work the cemented gravel will be completed in October.

D. H. Jackson of Placerville, with Eastern men, has bought the Landecker gravel mine for \$250,000 cash. Contracts will be let for building a mill and its equipment with machinery.

### Kern County.

C. A. Canfield of Bakersfield, manager, says the Chanslor-Midway pipe line will

not go through Sunset, but to the ocean at Port Harford direct. It would not handle Sunset oil, but will take Midway and some McKittrick product. Construction will start this month.

### Madera County.

(Special Correspondence).—The Yosemite C. M. & R. Co. is arranging to put in a steam hoisting plant. The property of the company consists of forty-eight acres, through which run four parallel veins about 300 feet apart, containing copper ore. On the outcrop of the veins shafts or other excavations have been made to 110 feet in depth. The property is in northern Madera county, contiguous to the branch of the Southern Pacific railroad from Berenda to Raymond, the right of way of the railroad forming its southern boundary. It is on the copper belt. Two and a half miles north is the Buchanan mine and still farther north, in Mariposa county, are the Green and Green Mountain copper mines. Three miles south of the Yosemite company's ground is the Ne Plus Ultra copper mine. The principal working shaft is within 200 feet of the railroad. At that point also is a stream of water fed by springs. The veins carry carbonate ores, with black and red oxides above the water level, where they change to sulphide—water being found at depth of 50 to 60 feet. The width at water level is 4 to 10 feet. The sulphide ore so far as tested is of shipping grade. On two of the veins shafts have been sunk, one to 60 feet and the other to 110 feet. At depth of 92 feet the deeper shafts opened up native copper, and the quartz at that depth carries also the red and black oxides. The office of the company is at Fresno.

Fresno, Sept. 6.

### Nevada County.

Manager J. Underwood, of the Omega mine, near Washington, has men retimbering the tunnel. Next week he expects to begin construction of a dam. When the Omega mine is again in full operation it will employ seventy-five men.

The Mohegan-Gold Flat M. Co. of Grass Valley, J. T. Morgan, president, will resume development of its property on Gold Flat, with J. Skewes as superintendent.

The Nevada County mine has been connected with the Siberian mine's water main, near North Columbia, for power, giving it a 600-foot head.—The Badger Hill mine is being opened up by W. H. Hicks, C. Hopkins and M. MacConnell of San Francisco. They will pump out the 120-foot shaft and sink it deeper. Then they will drift both ways.—Another mine at Badger Hill is being developed by O. Griffiths. He has put in an arrastra and is working the ore, which has free gold.

At Rough and Ready the steam pumps are unwatering the Ironclad mine. Cross-cutting will be resumed, as will also the driving of the drift in the 330-foot level. Foreman E. Russell has charge temporarily for Superintendent S. J. McConnell.—Sinking the new shaft on the New Constitution ground on Randolph Flat is well under way, under G. C. Hay. The shaft is a double compartment and is going down on the vein, 200 yards from the old one. Machinery is being placed for a steam hoist.

### Orange County.

The Santa Ana Tin Co., operating in the Santa Ana mountains, near the head of Trabuco canyon, are treating their ores by a wet process which is reported to operate satisfactorily. It is claimed these mines produce a number of rare metals, as well as tin.

### Placer County.

The Star Town mine at Last Chance, near Michigan Bluff, is running a bedrock tunnel to tap the main channel. W. Davis is superintendent.—The Evening Star mine has been bonded by an Eastern company, which is working two shifts. They are running a bedrock tunnel to tap the main channel.—At the Deep Canyon G. M. Co.'s mine stoping is under way. The men are following a lead across the canyon.—The company owning the Channel Bend river claim, E. C. Kavanaugh manager, has started work on the dam which will be used to work the mine. The dam is being built 1 mile below the mine on the American river.

The Placer M. Co., of which D. Ray is superintendent, at Last Chance, near Michigan Bluff, has struck the channel and gravel is being taken out. When the raise which they are driving is completed thirty men will be added to the payroll.

### Shasta County.

(Special Correspondence).—In Old Diggins mining district, near Redding, D. E. Hunt and J. Sallee have obtained a bond on the Reid mines, consisting of six claims. To west of this group they have also a bond on the Hendy group, owned by Joshua Hendy Estate of San Francisco, for

driving a tunnel a distance of 1200 feet to strike the ledge of the Sampson mine of the Reid group at a depth of 320 feet and 220 feet below the level of the old workings. The entrance to this tunnel is 4000 feet from railroad spur on opposite side of Sacramento river, where will be built bunkers for ore to be shipped across by aerial tramway moved by electrical power. At a point 900 feet in, a crosscut is being run to open the ledge of the Spanish mine. The old workings on the Sampson consist of a 150-foot crosscut cutting the 14-foot ledge at 150 feet below the surface, and drifts run each way. The quartz was shipped to Keswick and averaged \$6 a ton in gold. No stoping was done. Electricity will be used in working aerial tramway and also the drills in development operations.

The property of the Broda M. & S. Co. is located in Old Diggins mining district, and consists of eight full claims, patented ground. There are five distinct gold-bearing quartz veins, with values ranging from \$3 to \$20 gold per ton. There is also a copper vein, the values from shipments being 4% to 12% copper, and from \$1.50 to \$7 in gold. Development is progressing with the tunnel in 120 feet and at 400 feet farther in it is expected the copper ore body will be cut at a depth of 400 feet below surface. An 80-foot shaft cut through 50 feet of gossan and the ore found assayed 7% copper and \$2 gold. Several gold-bearing quartz ledges will be cut by the tunnel before the copper ledge is reached. The company is of Redding, with F. F. Dustin, secretary; W. W. Old, manager.

The Shasta National Con. M. Co. has been organized in New York City and bonded the eight mining claims in Old Diggins mining district, owned by the National Con. M. Co. of San Francisco. The main crosscut tunnel is in 900 feet cutting the ledge and from that point drifts were run 500 feet, a winze was sunk 100 feet and drifts run 400 feet. At 200 feet farther on in the main drift another winze was sunk 300 feet and drifts run several hundred feet from two levels. All ore above these drifts was stoped and milled. The mine has been idle for several years. J. Dailey is in charge, and he has run a crosscut from a point 500 feet in, in the old tunnel, 150 feet, cutting a second ledge 6 feet in width. On each wall is a 6-inch pay streak of white quartz, base in character, with values of \$20 per ton in gold. Work will continue for 50 feet farther when a drift will be sunk and crosscuts made. On the property is a 20-stamp mill with four Frue vanners and a cyanide plant of 25 tons per day capacity, an assay laboratory, office and other buildings. H. P. Walker is president; C. V. N. Radcliff, treasurer; P. M. Maher, secretary. The main office is in San Francisco.

Redding, Sept. 6.

(Special Correspondence).—Near Shasta, Berg and Dobrousky Bros. of Redding are developing the Early Discovery, a gold group. The area consists of 160 acres of patented ground with several contact veins. A crosscut tunnel at 190 feet in cut a 3-foot ledge of ore 100 feet below the surface. Drifts were run both ways. The ore is a soft, granulated quartz, and averages \$10 per ton in gold. A three-compartment raise is being driven to reach the surface to aid in getting air. Afterward a shaft will be sunk to open the ledges at greater depth.

South of Shasta, the Middle Creek G. M. Co. is preparing to work the porphyry dykes cutting through its claims. The ground is near the Bunker Hill mine. H. O. Cummins is in charge for the Gold Creek M. Co., it being composed of North Dakota men. A sinking pump has been put in, in addition to the hoisting plant already in operation.

G. A. Schroeter has men mining ore from his group, 4 miles south of Shasta. The ore is shipped to Selby's.

The Sunlight mine, owned by W. A. Pryor et al., is being negotiated for by Eastern men. The advent of electrical power around Shasta will enable this property to be unwatered, and the ore, known to exist in drifts already made, to be mined and shipped. The intention is to sink the main shaft to 200 feet, establish levels and run drifts.

Midway between the Mt. Shasta mine and Whiskeytown is the Kankapee group of six claims, owned by Pryor, Henry et al. Development will begin under bond September 15.

Seven miles from Oro, L. F. Barlow, as manager, has men working the property of the Marina Mariscano G. M. & M. Co. of San Francisco. The group comprises eight claims, and is on the divide between Jerusalem creek and North Fork of the Cottonwood. There are two parallel ledges, the ore is oxidized and also carries sulphides. The 1200-foot tunnel tapped the ledge at 350 feet below the surface, and drifting from that point was extended each way 500 feet. The ledges

are irregular in width, and are in a general formation of lime and porphyry. The value of 1000 tons of the ore shipped to the smelter showed \$223 per ton.

Shasta, Sept. 6.

(Special Correspondence).—Near Whitehouse Camp, in Old Diggings district, considerable activity in mining is under way. Low-grade ore is being shipped across the river by an elevated wire tramway and loaded onto cars at Central station at \$2 per ton. The tramway works by gravity, the boxes of ore requiring derrick power to load onto the cars. The work is under supervision of A. A. Anthony.

The Original Quartz Hill G. M. Co. is developing three patented claims in Old Diggings mining district. The formation is a diorite and the ore white and rose-tinted quartz, carrying tellurides of gold, with a small percentage of sulphurets, and classed into "low grade" with values of \$5 per ton and "select" with \$40 per ton. There are three well-defined ledges extending through the claims, with a northwest-southeast course. The main or west ledge is 40 feet wide, the middle ledge 37 feet, and the east ledge 12 feet in width. Development is by open cuts. The tunnel on the middle ledge, 330 feet in, with a crosscut 100 feet, is at the breast 140 feet below the surface. Connections are made to the surface by raises. In the lower tunnel the ore body between walls is 49 feet. Superintendent W. J. O'Donnell estimates 200,000 tons of ore ready for stoping above this tunnel to the surface. The Keswick smelter, 3 miles away, pays \$2 per ton for quartz flux. The company is composed of Chicago, Ill., men. It is proposed to build a reduction plant. M. Maryganski is manager.

The Central mine, near Whitehouse, is owned by Whitehouse & Bliss of New York. It was first worked in 1879. The ledges are from 1 to 14 feet in width and principally between walls of slate. The ore is quartz and is being used as flux at the Keswick smelter. The upper tunnel at 235 feet cut the ledge and 400 feet of drifting has followed. Another tunnel cut the ledge at 900 feet in, and drifts have been run 600 feet. Men are doing development under the management of A. A. Anthony.

The Evening Star group of three claims, owned by F. Panter and F. Litsch of San Francisco, has been developed. The ledge matter is quartz between walls of porphyry and slate. The ore carries sulphurets, with tellurides, the average value being \$10 per ton in gold. The 1500-foot tunnel struck the ledge at 1200 feet in. At one point in the drift from the tunnel the ore shoot is 120 feet in length. C. Lanyon is superintendent.

Walker Bros. of Salt Lake City, Utah, compose the Utah & California G. M. Co., owning a group of claims near Whitehouse, and have G. Seamans in charge. Recently a leasing contract was made with Lawyer & Thompson, and they are making regular shipments to the Keswick smelter.—V. Veuquod and A. Duval are developing a promising claim on the banks of the Sacramento river, opposite Central station, near Keswick. The ledge is 2 feet wide of low-grade ore, which is sold to the Keswick smelter.—R. C. Wilson of De Lamar and C. O'B. Redding of San Francisco are developing a copper proposition on Little Bully hill, near Winthrop. The double-compartment shaft is down 90 feet and at 100 feet farther depth they expect to strike the vein of the Bully Hill.

Redding, Sept. 7.

(Special Correspondence).—The Redding G. & C. Co. is operating on Clear creek, 12 miles from Redding. The holdings are 128 acres of patented placer ground, extending 1½ mile above the Igo bridge and ½ mile below. Lumber has been delivered for building a flume to divert the water from the river bed during building of the dam. At same time the gravel of the river bottom will be washed for gold it may contain. About 1000 feet below the dam an electric power plant will be erected for transmitting power to mines, mills and commercial interests. A smelter may be built, as over 200 tons of ore have been guaranteed to be delivered daily from the gold properties in that section. L. F. Mitchell is manager.

Redding, Sept. 7.

#### Siskiyou County.

(Special Correspondence).—The King Solomon mines, near Cecilville, are owned by the Canyon Mountain Co. of New York. The former owners placed on the property an 8-stamp and a 5-foot Huntington mill, with which they treated the ore taken out to a depth of 250 feet on a 60-foot ledge. The shoot has been proven 600 feet in length. The company, under the management of W. H. Young, has run a crosscut tunnel 600 feet and tapped the ledge 200 feet below the old workings. The ledge was 60 feet wide at that point. The strike of the ledge is 40° east of

north, next to a schist formation on one side. A mill run of 600 tons taken from the ore shoot gave a return of \$6 per ton in gold. A winze has been sunk 50 feet and in the same character of ore. Manager Young says the old milling plant has been abandoned and the company will increase developments during the coming winter, and in the spring build a 20-stamp mill and a cyaniding plant. Electricity will be the motive power in use.

Cecilville, Sept. 6.

(Special Correspondence).—On Nigger creek, 12 miles from Gazelle, the Shook M. Co. owns 320 acres of patented railroad land. The mineral ledges are in a slate formation and some are 30 feet in width. Development is by a 75-foot shaft on the ledge and three tunnels in 150 feet each. The ore is a sulphide. Concentrators are not yet used in the stamp mill. A portion of the 320 acres is gold-bearing gravel, there being a channel 70 feet wide, 1500 feet long, and the banks 15 feet in depth. Several nuggets have been found. J. W. Shook, at the mine, J. L. Berry and H. A. Behnke of Gazelle are owners.

Gazelle, Sept. 6.

(Special Correspondence).—The Siskiyou Electric Power Co., with headquarters at Yreka, E. H. Steele manager, has its plant installed on Fall creek, 22 miles northeast of Yreka, where from a spring and two creeks at least 2000 inches of water are at all seasons available. The plant starts with 500 K.W. output, but has a capacity for 4000 K.W., and the pipe is laid for that power. The lines extend to Yreka, a branch going to Montague, and the main line from Yreka to Fort Jones, Etna, Callahans and the principal mines of the various gulches and throughout Scott valley. Light is furnished to the towns and light and power to the mines, mills and sawmills.

The Crater Creek M. & D. Co. of Santa Rosa has bought and is developing nine claims adjoining and across the ridge from the Dewey mine. The foot wall is slate and the hanging wall granite, with the ore quartz, with values of \$15 per ton in gold. Development work is being increased to admit of placing hoisting and other machinery next spring. W. T. Barnes, H. Butts and P. F. Green of Santa Rosa are president, secretary and treasurer, respectively.

On Salmon mountain, between Friend and Six Mile creeks, M. J. Ward of San Francisco and J. B. Foot as manager are developing a group with a 6-foot ledge outcropping between slate and porphyry. The main tunnel—a crosscut—is in 1000 feet. It has maintained that width in 400 feet of drifting to the east and west. The ore as put through a 2-stamp mill yields \$20 per ton in gold. As it carries sulphurets, a cyanide plant will be added next spring.

Yreka, Sept. 7.

(Special Correspondence).—On Scott mountain, 7 miles from Callahans, the Forest King M. Co. of Portland, Or., is developing a group of claims. The ledges are on a contact between porphyry and serpentine, with bunches of siliceous ores, high grade, with sulphides and free gold. Development is by sinking on the side of the ledge matter in the serpentine wall, because it is soft. Manager J. Empey will develop the ground from the 100-foot level, using a horse whim for hoisting purposes. He estimates 500 tons of high-grade ore on the dump.

Callahans, Sept. 6.

#### Trinity County.

(Special Correspondence).—Mining operations in Hayfork section are not active at present. The Tom Layman group of four claims, within 5 miles of Hayfork, shows a quartz ledge 20 feet in width with gold values. The property is partially developed by three tunnels—40 feet, 110 feet and 200 feet. There is another crosscut tunnel of 240 feet. In a 4-foot ledge assays show values of \$50 in gold. Across the gulch is the extension, owned by L. Layman. Three tunnels—50 feet, 100 feet and 170 feet—show a ledge of quartz 4 feet in width carrying much gold. The best values in all these claims are found in small stringers of sugary quartz. The owners are developing. The ore, a sugary quartz, with sulphurets, assays \$60.

The Golden Summit Hydraulic Co. owns on Weaverville road, 10 miles from Hayfork, 500 acres of gravel ground which it is estimated will yield 15 cents in gold per cubic yard. Work is under way on ditch to bring water from Summit creek and will be finished by October and mining operations begun. Forty acres are blocked out, one open cut being 700 feet in length showing good gravel below. The banks are 25 to 35 feet in thickness and the bedrock is slate. R. Mack and B. F. Myers are principal owners of the company. Platinum values are also found in the gravels.

Van Gordon, Coler, Smith & Hammond have formed the Drinkwater M. Co. and bought the Drinkwater gravel mine of

160 acres, and 120 acres additional for dumping ground. Water is brought from Kingsbury creek. A No. 2 hydraulic giant is in use.

J. B. Dobbins of Hayfork owns a group of four claims which are an extension of those of the Layman group. The 200-foot tunnel opens up a well-defined ledge in slate walls. Several open cuts on the surface show stringers of quartz with gold values. The lower tunnel is in 180 feet and by farther driving it is expected the 4-foot ledge will be cut at 400 feet below surface outcrop. They will work the property during coming fall and winter.

M. G. Wormack and F. Bowerman have found, about 14 miles east of Weaverville in a serpentine formation, a ledge of asbestos, the fibers being from 4 to 10 inches in length.—C. D. Morton et al. own at Hynopm, 25 miles south of Hayfork, 1200 acres of lignite coal holdings.—J. W. Diller owns on Salt creek three claims which he is developing by sinking a shaft on a 3-foot ledge of quartz. It is a low-grade proposition. Near his property is a natural bridge, the arch of which is 40 feet high and 100 feet across.

On Kingsbury creek A. L. Kellogg owns a group of five claims, the ledges being in blanket form and between porphyry and slate. The ore is free milling and values from pockets worked by arrastra yielded \$60 to the ton. Development is by three tunnels 40 to 200 feet in length.—Fifteen miles west of Hayfork W. H. Friend is developing a group of seven claims in a slate and granite formation. The ledge, 16 feet in width, is quartz with iron sulphurets, carrying silver and gold values. A tunnel 150 feet in cut ledge at 75 feet below the surface and values were \$12 per ton.—Berry & Keller of Selma have bonded the McCampbell group of claims up Hayfork canyon and are increasing developments. On the surface a 6-inch stringer has been exposed for 1000 feet.

On Barker creek, 6 miles northeast of Hayfork, C. H. Farmer et al. are developing a group of three claims. The workings are on a 3-foot ledge in granite, slate and quartzite. One tunnel is in 800 feet, another 180 feet. Ore is a white quartz with \$25 assays.

Hayfork, Sept. 6.

#### Taolunne County.

It is reported machine drills will be placed in the Mohican mine, near Groveland. The incline shaft is down 300 feet from the tunnel level, and the ore is reported yielding satisfactory results in the 10-stamp mill.—A gasoline engine and hoist are being put in at the Hall Ranch mine, near Groveland, where operations will begin next week, says A. Trittenbach of the Dutch mine, at Quartz, who is manager.

El Rico M. Co., operating the Belle mine, near Tuttletown, has been granted extension of one year on its bond. Among the improvements proposed by the company is enlargement of the shaft from one to three compartments. After that is done the shaft will be sunk 200 feet deeper, making it 800 feet total. The hoisting machinery will be replaced by a double reel hoist. W. J. Rule is superintendent.

#### Yuba County.

Men have been put to work in the Boa mine, at Timbuctoo, near Marysville. M. C. Meeker is superintendent.

### COLORADO.

(Special Correspondence).—Arrangements have been completed for blowing in of the smelter at Golden this month. The plant will be run as an "independent" operator and is expected to be a stimulus to mining in the section tributary to Golden. The plant was erected some years ago and operated as a pyritic smelter, but for various reasons it was closed down. The new management claims to have a market for its matte and will be in a position to handle all classes of ores excepting those in excess of 5% lead. They claim to have made a low treatment charge and with the low freight rates now existing, the output in Clear Creek, Gilpin, Boulder and other counties should be materially increased. The plant will have an ore capacity of 300 tons per day.

The new United States mint at Denver was opened the past week. It is said that before the end of another year the coinage of gold will begin, and a local market will be established for all the gold produced in the Rocky mountains. Coinage machinery will be installed as rapidly as possible. For the present the new mint will be used for the purchase of bullion and as an assay office. Director Roberts was present at the opening.

Large amounts of printed matter and advertising literature are being distributed by the State at the World's Fair, that Colorado may be well advertised.

Denver, Sept. 4.

(Special Correspondence).—The political situation in Colorado at present is not

political. Are we going to have a Governor that has backbone, or are we going to have a man who will sit by and let the Western Federation of Miners run the business? It seems we are more interested in the Governor than in the President, although he has taken a pretty good stand himself on unionism. I find this said everywhere in my travels, in talking with business men and mine managers: "Are we going to be allowed to run our business, or will Mr. Moyer and Mr. Haywood be in a position to dictate to us? If they are, we might as well close up shop and get out." Few people in Colorado outside of the Federation of Miners object to the deportations of the Governor, or, in fact, the white cappers, who are now taking charge of things in the Cripple Creek district.

In San Juan county (Silverton district) they have no strike. When the miners and operators made an agreement a couple of years ago, the operators made the statement: "We have property. If we break this agreement or contract, you can come on to us for damages. What have you, as collateral or security, that you will put up, that you, as a body, or as a union, will not violate your agreement?" They put up their Union hall at Silverton as security. When the strike came on, Mr. Moyer called them out. They told him: "We have a contract, and our building is up as security." His reply was: "To hell with the contract! I want you to strike." Had they gone on strike they would have lost their building. San Juan county is prosperous to-day, because they have no strike.

Denver, Sept. 5.

#### Chaffee County.

The Salida Copper-Gold Co.'s leaching plant, 4 miles west of Salida, is in operation. The plant has a capacity of 300 tons per day.

#### Clear Creek County.

The Queen City G. M. & M. Co., operating on Democrat mountain, near Georgetown, is increasing development. Work on the main tunnel is in 450 feet. The tunnel will cut under apex of mountain at depth of 1000 feet, and will open the Astor vein. It will be necessary to drive a total of 1500 feet. A. B. Montgomery, of Denver, is manager. The group consists of twenty-five claims.

The output from the Sunburst mine, near Georgetown, operated by the Red Oak M. Co., will be largely increased. Concentration tests are being made. Jones & Co., operating a lease in the lower level, have awaiting shipment 100 tons of ore, which gives returns of \$80 per ton. The block has been opened for 300 feet. A. Roberts is developing the upper Sunburst level and has exposed 12 inches of smelting ore. He is sending regular shipments. Other lessees are working.

#### Dolores County.

The concentrating mill at the mouth of the Group tunnel, near Rico, is being operated under lease by the Durango L. Co. The mill equipment consists of a crusher, two trommel screens, two Hartz jigs, two Huntington mills and ten Wilfley tables. Manager Hooper says he has increased the capacity of the mill one-third by installation of the jigs, and has prevented the pulp from sliming by extracting the lead, carrying glance and brittle silver, before the ore enters the Huntingtons.

The Intrinsic G. M. & M. Co. at Rico has put on more men and will increase development of the ore bodies of Sambo hill.—The three-compartment raise on the Enterprise vein of the Pro Patria workings is being placed in condition. Three eight-hour shifts are on the work. The Argentine mine is sending average of thirty-five tons of ore per day to the mill. But one shift is in the mine. The mill is working twelve hours per day and turning out lead concentrates.

#### Fremont County.

Florence reports say at the Dorcas mill the leaching is finished, and the company will be enabled to gain a greater percentage of values. Fifty-dollar ore and upward is said to be handled successfully.

#### Gunnison County.

G. Williams, manager of the Congress M. Co. at White Pine, says he is putting in machinery at the mine for development work.

The Pitkin Reduction Co.'s plant, formerly the Quartz Creek M. & S. Works, has reopened under the management of A. B. Clark, who intends to treat custom ores of the mines near Pitkin. The mill is being overhauled. In connection with the plant is a laboratory and assay office for sampling and testing of ores for cyanide process.

The Gothic M., M. & C. Co. of Canton, Ill., men, is operating its 100-ton mill on ores of Gothic section. Its smelting plant of fifty tons capacity will not be operated this season. The company is operating

the Hard Cash mine on Galena mountain at Elko. It has a jack train of forty animals packing ore to the mill. High grade ore has been opened in the 300-foot tunnel on the Hard Cash. The vein shows a foot of solid galena, with gold and silver values. The output will be increased. The tunnel will be driven 500 feet farther to cut the New York vein. A jack train of seventy-five animals and two four-horse teams are hauling ore to the mill from the Sylvanite mine, operated by the Gothic M., M. & C. Co. The ore is a high-grade silver material.

#### Hinsdale County.

The Handie's Peak G. M. & M. Co., M. Corwin, superintendent, has started operation of the Leonard group, between Boulder and American basins, near Lake City. From Boulder basin a crosscut tunnel of 400 feet will be driven to develop the mineral bodies of the group and in the Basin mine buildings will be erected.

G. W. Dryden, manager of the Pelican M. & M. Co., says he will start development of the Pelican group of mines, up Henson creek, near Lake City. A tunnel will be driven, also continue the drift on the Pelican vein for 100 feet from the present breast. The new tunnel will start on the Atlanta lode of the Pelican group and will be 600 feet long, giving 240 feet additional depth on the Pelican vein.

#### Lake County.

L. F. Jones, of Chicago, Ill., superintending installation of the electrical plant at the Yak tunnel at Leadville, says a direct connected dynamo and engine is being placed in position and the wiring of the tunnel is being completed. The trolley wires and feeders have been put in the tunnel to the Cord winze and the tracks to that point have been connected for electrical trains. By next week he expects to have 3 miles of the tunnel and its connections ready for the electric trains. Electrical pumps and electrical hoists are to be put in the Yak and some of the properties tapped by the tunnel. The Cord winze is a double compartment shaft. An electrical hoist with two drums will be set up in the Cord to take the place of the steam plant in use. The pumps which have been operated with compressed air will be furnished with power from the dynamos.

Five shafts are being worked by the Small Hopes M. Co. and its lessees on Yankee hill, Leadville. The ore being taken out is mostly low grade. The Emmet shaft is center of operations and is being developed both by company and by a set of lessees. The second level of the mine, 600 feet from the surface, is being worked by the company. The bottom, or 800-foot level, is being operated by lessees who are taking out ore and also doing exploratory work. On the Cary and Result shafts lessees are working. From those shafts a total of thirty tons a day is being shipped, chiefly iron ore. The Small Hopes Co. is shipping 1000 tons a month from the R. A. M. dump. The dump was made a storage for ore taken out of the R. A. M. several years ago.

#### Ouray County.

The report of Manager Cox of the Camp Bird, Ltd., operating at Camp Bird, for the fiscal year ended April 30, 1904, shows 73,718 tons of ore mined and treated, producing:

Gold.....	\$1,857,271
Silver.....	50,151
Lead.....	14,370
Copper.....	469
Total.....	\$1,922,261

Amalgamation recovered, 78.3% of the values; concentration, 14.6%; cyaniding, 7.1%. The sixty stamps were dropped 355 days and the cyaniding plant ran 352½ days, treating 65,736 tons, dry weight, of mill tailings. The maintenance and operating costs for the stamp mill were \$77,629, and for the cyaniding plant \$50,958.—In regard to the electric installation, the superintendent's report says: "The advantages derived through the electric storage battery pertain to both safety and economy, since it will be possible to operate hoists for a time after the potential current is interrupted, avoid overloads to the potential lines and charge the storage when loads are light in other directions. The distance from portal of mine to collar of main shaft on third level is nearly 1 mile. It is decided to operate all pumping plants with induction motors of 400 volts." The 10,000-volt system will be extended underground to a point near the shaft collar and the current there stepped down. At the mills electric power was substituted for steam in December last. During the summer the mill is operated by water power. On the third level in the mine 5000 feet of track were realigned, the number of ties doubled and other replacements made to make the track safe and firm for electric haulage. The heating plant in the mill was

changed from water to steam system.—The summary of development work during the year shows: Drifts, 3184 feet; crosscuts, 221 feet; raises, 1178 feet; shaft, 234 feet; diamond drilling, 4620 feet. On construction work \$153,584 was expended. Ten stamps will be added to the mill.

#### Pueblo County.

Pueblo reports say repairs on the three blast furnaces at the Minnequa works of the Colorado F. & I. Co. are progressing. It is expected the three furnaces will be blown in next week. The wire mill will be running at full capacity, as the securing of rates by the company to Eastern and Southern points will provide a market for its full output.

#### San Juan County.

Shipments of concentrates and ore from the Highland Mary mine, near Howardsville, have resumed. Additional canvas tables are working. About one car of ore a week is being shipped to the smelter, says Manager Graham.

#### San Miguel County.

The Telluride Power Co. maintains an electric generating plant at Ames, 14 miles from Telluride, capable of generating 14,000 H. P. At Vance Junction, 7 miles below Ames station, it owns another electric plant with capacity of 2000 H. P. The latter place is 7 miles below Telluride. Coal in Telluride costs \$7.50 per ton; in addition to this, is the cost of packing the same to the mining and milling plants. Electric power is furnished at a nominal figure, and among the mines using it are the Smuggler-Union, Tomboy, Camp Bird, Liberty Bell, Japan, Nellie and Ella, Gold King, Ophir Con., Alta, Butterfly and the Mayflower. By the route over which the power is transmitted to the Camp Bird mills of Ouray Co., the distance is 20 miles, says L. L. Nunn, manager.—On the Nellie and Ella mine, 2 miles up Bear Creek basin from Telluride, forty men are employed. The products of the mines, consisting of fifty tons daily, is transported over a wire-rope tramway between the Ella and the Bear creek mill, 1½ mile in length. The output keeps twenty of the stamps constantly dropping.

In Mt. Wilson district M. A. Wood of Telluride and P. P. Steinwandle of Canyon City, owners of the G. A. R. group, in Navajo basin, are increasing development work. They are driving a crosscut tunnel to open the principal lead at a depth of 1000 feet below the surface.—Near the G. A. R. group J. A. Ross and J. G. Eversman of Denver own the Wheel of Fortune group. A tunnel 2000 feet in length has been driven in from the Navajo basin side. Three cross lodes have been cut and one of them is 10 feet in width. The ore is of lead and silver, carrying values in gold.

#### Summit County.

The Reliance Gold Dredging Co., near Breckenridge, E. L. Smith superintendent, has started work of building a dredger on the company's French gulch placer holdings. A series of drill holes are being sunk to determine location of the dredger.—The compressor and air drills put in at the Jessie mine are in operation. The mill started up this week.

#### Teller County.

For a year experiments have been in progress on the dumps of the Stratton's Independence, Ltd., at Victor, to determine method of treatment. It is estimated there are 750,000 tons of ore in the dumps, which will yield a profit of about \$3.50 per ton. It is stated that the metallurgist proposes to submit his plans to the directors in London, Eng., to build a mill with capacity for treating 1000 tons per day. There are now eighteen sets of lessees, employing 200 men, in the Stratton's Independence, Ltd. It is stated that half of those leasing have ore which pays to ship.

The Rocky Mountain M. Co. has leased its Beacon hill property, at Cripple Creek, to L. H. Shepherd. The mine adjoins the El Paso company's ground. Shepherd will start a new working shaft with expectation of cutting extension of the main El Paso ore shoot.—Lessee Morton & Co., on lower portion of the Coriolanus mine, on Battle mountain, is putting in machinery.

V. C. Chellow & Co., who have a lease on the Gold Sovereign, Bull hill, at Victor, are unwatering the Jackson shaft. It is intended to start lateral work. At the Rawson shaft on the same group, Bradley & Dugan have come into ore and are putting in an 8-drill compressor. It is intended to crosscut east and west from the shaft, at a depth of 550 feet.

The Dexter G. M. & M. Co., owning the Dexter property on Bull hill, at Victor, began work on company account this week. The lease held by the Colorado L. & M. Co. has been cancelled. The shaft on the Dexter has been sunk to 650 feet. In the bottom of the shaft an 8-inch vein

has been opened, which is giving values of \$80 in gold to the ton. There is ore to be mined in both the 200 and 300-foot levels. The vein is there 3 feet wide, assaying \$30 in gold, says Manager W. E. C. Little. He will put in a 5-drill compressor, a 125 H. P. boiler and a 10x12 hoist.

#### IDAHO.

##### Boise County.

At the Thorne camp, in Gambrinus district, near Idaho City, work is progressing in the shaft, which is down about 145 feet. Machine drills have been put in. The shaft is of two compartments. A cage has been put in, replacing the bucket. The nearest ledge to the shaft is the John Henry, which will be tapped at a depth of 300 feet. V. Thorne is manager.

The South Africa M. Co., near Idaho City, will put in a Chili mill with capacity of 100 tons daily.

##### Idaho County.

The Dewey mine of the Buffalo Hump district has been sold to the Central Hump Buffalo Co. G. Bremer of Seattle, Wash., is interested, and says they brought it mainly for the water power on it that is necessary to development of other mines held by the company. The company is planning to build a smelter.

The Ranier G. M. Co. owns a group of five claims, 3½ miles south of Warren. Work consists of sinking a shaft and running a crosscut. A hoist will be put in at the shaft, also other equipment. The company is arranging to have its ores milled at the Keystone mill, which property joins that of the Ranier on the west, says J. B. Brown, manager of the Ranier.—Three miles east of the Ranier company's mines is the Mayflower group owned by the Thunder Mountain Gold Reef M. Co., of which J. E. Jewell is superintendent and manager. The company is completing a concentrating and cyanide plant.—The Silver King Co. is increasing operations with twenty men. Work is confined to the lower or crosscut tunnel which is in 1150 feet. The Keystone mine is also operated by the Silver King Co. The mill will be ready for operations next week.—H. Shieler & Co. will work the Little Giant mine and are preparing for operations at the mill.

##### Kootenai County.

Manager F. W. Haverland, of the Tyson M. & M. Co., at Tyson, near Saint Maries, has started building an 18-mile ditch, which is estimated will cost \$50,000.

##### Latah County.

The mining department at the University of Idaho, at Moscow, is increasing its geological and mineralogical equipment. The mining department has about \$6000 worth of apparatus, and occupies nine rooms in the new school of mines building. It is proposed to add a metallurgical laboratory equipped with machinery, to work ore by all known processes. There will also be diagrams of all known processes that are considered worthy of attention. Sectional views of the leading processes will give a fair idea of their workings at a glance. A. S. Miller is in charge of the mining department.

##### Shoshone County.

J. A. Morrow says in the Pierce City mining district, near Greer, he has development work under way on the Wild Rose group. He has drifted on the main lead. The ore has been tapped at depth of 100 feet. The mill will be started next month and will be operated all winter. J. Gaffney is working the Ozark mine. T. Wilkinson is operating a cyanide plant on the Wild Rose tailings. The tailings assayed \$8 and Wilkinson reports saving \$8 per ton. The plant has a capacity of sixty tons per month, and during the summer 300 tons have been handled.

The Bunker Hill & Sullivan M. & C. Co. at Wardner has put in a 50,000-pound weighing railroad track scale. An addition 40x60 feet has been built on the mill for placing eight Wilfley slime tables. An addition of 75 H. P. to the compressor plant has also been made. J. L. Safford, R. L. Brainard and J. Brantly are working their Big creek mines.—Work has started in the Silver King mine. The mill is being operated. The work is under J. Kendall.

##### Washington County.

Landore reports say work on the smelter is progressing, and Manager Adams expects to start operations next month.—Ford's Black Lake property is working sixty men. The ore bins are finished and the mill is nearly completed. The tram is being overhauled and Manager Ford states the plant will be started before October 1st. The mine is at Black Lake, near Council.

#### KENTUCKY.

##### Livingston County.

Near Salem a concentrating plant is being built on the Cullen mine. Equipment

includes two 200 H. P. boilers, a 150 H. P. engine, a revolving mechanical dryer, two crushers, four sets of rolls and nine jigs. An air compressor is also being set up. The shaft is down 160 feet, and the vein is 23 feet wide.

#### MONTANA.

##### Broadwater County.

Operations have been resumed in the East Pacific mine, near Winston, by R. A. Bell of Helena.

##### Deer Lodge County.

Superintendent C. Coughlin of Camp Caroline, near Anaconda, says it is the intention of the company to sink a 500-foot shaft on the Sunset claim. There has been considerable surface prospecting and ore taken out. The Blackwell mill has been remodeled and Coughlin is testing ore taken from the Sunset. They have a streak of pay rock at 85 feet and will determine if the concentrating process will be profitable. The ore is run over the plates and then goes to tables. They have 3 miles to haul the concentrates.

##### Flathead County.

The Cherry Creek Placer Co. has been organized and Manager P. D. Pratt has men surveying a ditch line near Libby. It is expected this will give them 200 feet fall at the point where the first piping will be done. The ditch will be dug, the pipe line put in, sluice boxes built and sluicing of gravel started this winter. The company will put in a sawmill to cut timber for buildings, etc. The company owns eight placer claims on Cherry creek. There are 1120 acres in the group. The ditch will be 1½ mile long and will be built to carry 5000 inches of water.

Superintendent T. Fleetwood of the Illinois & Montana M. Co. has started development work on the company's placer claims to get the necessary work done for a patent. The company will increase development of its quartz claims, also in West Fisher district, near Libby. Machinery will be put in and buildings put up. The ores will be milled. J. H. Geiger is manager.

##### Lewis and Clarke County.

The Red Bird M. Co. is operating a copper group west of Helena and in the Reliance mine is taking out ore from a 5-foot vein running \$80 a ton in gold, silver and copper.

##### Missoula County.

The mines and equipment of the Duquesne M. Co., near St. Regis, have been sold to A. Lutz of Alleghany, Pa., who will operate the group.

#### NEVADA.

##### Esmeralda County.

Bell, Sharpe and Stewart expect to have their mill in operation next week. The mill is 3 miles from their mine, the Golden Fleece, at Aurora, near Hawthorne.

##### Humboldt County.

The American Nickel Co., owning mines at Nickel, in Cottonwood canyon, near Lovelocks, reports it will sink a shaft 1000 feet to open up its nickel and cobalt ores. C. Bell is superintendent.

At the Sheba mine, south of Mill City, the shaft has been unwatered and they are again developing the lower workings. A raise is started by which ore from the old workings will be taken out by way of the new tunnel and conveyed by tramway to the mill in the canyon below. J. Kessel is in charge.

##### Nye County.

At the Tonopah-Extension mine, at Tonopah, the 125 H. P. boiler has been set up and steam connections made with the twelve drill compressor plant. Sinking is to be resumed. The drifts on the 400 and 500-foot levels continue to show ore.—The shaft on the Free Gold M. Co. mine at Gold Reef, near Tonopah, is down 90 feet, and assays give values of \$25 in gold. Superintendent C. Madison is building the galloways frame for the hoisting plant, which is set up.

##### White Pine County.

The Giroux Con. M. Co., which has holdings at Pilot Knob, near Ely, is credited with intention to build a smelter at its Dewey and Taylor shafts. J. L. Giroux of Los Angeles, Cal., is manager.

#### NEW MEXICO.

##### Dona Ana County.

The concentrator of the Stephen Bennett mine at Organ is resuming.—A concentrator will be built at Gold Camp in the Organ mountains, near Organ. F. H. Bascom Co. of Las Cruces is interested.

##### Grant County.

Silver City reports say work on the smelter of the Commanche M. & M. Co. is going on steadily. The capacity will be 200 tons daily and it will contain three furnaces. The foundations are completed

and the frame work is going up. The stacks have men at work upon them.

#### Lincoln County.

Vice-President Franklin of Chicago, Ill., and Director Falkenstein of the Jicarilla M. & M. Co., operating at Jicarilla, report they will put up a mill to treat the ores of the camp and surrounding country. Construction will begin November 1.

#### Rio Arriba County.

The Keystone-Bromide M. Co. at Bromide is increasing work in its Dillon Development tunnel. Work will be resumed on the Strawberry mine at Bromide.—J. D. Maupin has cut a body of copper ore on the Sunny Side mine at Bromide.

The Tusas Peaks M. Co., at Tusas, is opening up ore leading to the main vein in sinking the shaft on the Tampa mine.—The Jaw Bone Dev. Co., at Bromide, has put in a diamond drill, and reports progress in development work.—Satisfactory results are reported from the new concentrator at Buck Horn mine, at Hopewell.

#### Sierra County.

On the Treasure mine, near Hillsboro, ore carrying \$80 per ton in gold has been struck.—Work is temporarily suspended on construction of the Good Hope-Bonanza mill, near Hillsboro, due to inability to get timber from the sawmill, the road to which has been washed out by the rains.—At the Monument mine, near Fairview, air drills are being put in.

The shaft on the Snake mine at Hillsboro has been repaired to the 180-foot level. A hoisting engine is being put in.—M. Hennessey has increased his holdings of placer ground at Shandon to 600 acres, on which he will do extensive development work.

#### Socorro County.

The mining camps of Magdalena and Kelly report damage done to mining property by recent floods, the Graphic and Kelly mines being the principal losers. From the Graphic dump 200 tons of zinc ore were washed away. About two-thirds of the mines in the district were flooded.

### OREGON.

#### Baker County.

At the Blue Bird mine, near Sumpter, the milling plant is being finished. The 100-ton concentrating plant for the bodies of low-grade ores is being supplemented with a stamp mill for the free-milling ores. Drifting continues on the new ore body in vein No. 2, and it holds an average width of \$5 feet, with \$10 values, says Manager Wright.

J. Thomsen, manager of the May Queen mine, near Sumpter, says he has started ten stamps dropping. They are stopping ore from the ore shoot, which has proven 250 feet in length, and the raises are 100 feet high. Sinking will be resumed.

J. T. Mahoney of Sumpter is resuming development on the Porto Rico mine, in the McCully Fork section. The group comprises three claims, principal work being a shaft sunk on the vein, showing a width of 8 feet, with assays from \$2.60 to \$40 per ton.

Operation of the sinking plant put in at the I. X. L. mine, near Sumpter, has begun and the shaft of 200 feet will be extended 100 feet, and drifts run. The incline shaft will be discontinued. At the mill two 5-stamp batteries are crushing ore, and the cyanide plant is also in operation. The drifts on the main I. X. L. vein are 500 feet in length and 200 feet of drifting has been done on the Hidden Treasure, or cross vein. The sinking plant has a capacity for 800 feet, says Manager Kelly.

The Vault group of three claims in the Cracker Creek district, near Sumpter, have been bonded to J. W. Kontz and development has been started, the principal work being a drift. The vein is 8 feet in width, assaying \$5.

At the Viola mine, near Sumpter, owned by J. Hughes, a hoisting plant will be put in. The vein is 14 feet wide of milling ore.

#### Grant County.

At the Badger mine, near Susanville, the management is putting in an additional ten stamps, giving a combined capacity with the rolls of eighty-five tons daily. Ore is being stoped on the 600-foot level and on the 700-foot level. The ore body is 6 feet wide with 3 feet of high-grade shipping rock. Near junction of Elk creek and Middle Fork of John Day river an air compressor is being set up which will operate hoist and drills. The mill is being operated by direct water power. At the Bull of the Woods mine, across the creek, which is also owned by the Badger Co., the shaft is down 250 feet and an aerial tramway is being built to carry its ores to the Badger mill. High-grade ore is also being sacked from the mine, which, with the Badger's ore and concentrates, keeps eight six-horse teams

hauling from the mine to Tipton for shipment to the smelter.

#### Josephine County.

The Platts quartz group on Boland creek is reported developing a ledge 12 feet in width, carrying free gold values of \$10 to the ton. Platts & Sons, owners, expect to put on machinery. The Platts mine is near the mouth of Boland creek, near Althouse.

At California Bar on Sucker creek, near Althouse, the Sucker Creek M. Co., under Superintendent H. Warner, has put on a pumping and hoisting plant. Two drifts are being run to show the extent of the gravel deposit. Two pumps are used, one to keep out the water from the excavation and the other to pump water from the creek to operate the sluices. A 7-mile ditch has been surveyed.

S. Bowden is arranging for development and equipment of the Sunset mine, of which he is owner, near Kerby.—R. G. Virtue of Leland says he will start development of the Ajax mine, in which he is part owner, in Mount Reuben district.

### SOUTH DAKOTA.

#### Custer County.

The Extreme M. & M. Co., near Custer, will complete the tramway from the mine to the mill and will continue the main shaft to 300 feet. The 10-stamp mill will be operated.

#### Pennington County.

J. E. Young, treasurer of the Grand G. M. Co., says he is superintending erection of buildings and machinery at the company's mines near Hill City.—Work on the Sunbeam M. Co. group on Friday gulch, near Hill City, is being resumed. N. Hart of Lead is manager.

### UTAH.

#### Beaver County.

The Lulu M. Co. has been organized under the laws of Wyoming, with P. Ryan of Millford president and manager, M. Cullen of Salt Lake City, J. B. McCormick, and P. Conley of St. Paul, Minn., et al. The property adjoins the Horn Silver mine at Frisco, on the east. The Lulu has one shaft down 400 feet.

#### Grand County.

Moab reports say the Inter-State M. Co., G. H. Clark, manager, is building its 100-ton cyanide mill in Gold basin, 35 miles from Moab, and expects to have it completed before winter begins. The Ren Hatch gold-copper-cobalt property at Sinbad has been sold to Eastern parties.

The Grouse Mountain M. & S. Co., near Basin, has cut a vein which assays \$83, and will build a cyanide mill. The property consists of nine claims, 180 acres in all, and one water right on Placer creek, in the Miner's basin, La Sal district. It has been developed by two tunnels.

#### Juab County.

The Wasa M. Co. has been incorporated by J. and A. Soderlund, F. Sundell and A. Strom, the last named being manager. The company owns a group of nine claims in north Tintic, near Eureka, on which there is a vein of iron-bearing quartz carrying values in silver and gold.

#### Salt Lake County.

Manager W. Hatfield, of the Albion M. Co. at Alta, says the shaft has been unwatered, and the tunnel is in 2000 feet. With 700 feet more driving the main shaft will be tapped.

C. Wagener et al. report striking payable ore in Emigration canyon, 9 miles east of Salt Lake City. A fissure in sandstone was found 8 inches wide, assaying 100 ounces silver and 10% copper.

#### Summit County.

In the California mine, at Park City, ore is reported struck, showing 20 feet between walls, and is of milling grade. The ore bodies will be further developed before putting the mill in operation.

#### Tooele County.

(Special Correspondence).—The annual report of the Con. Mercur G. M. Co., operating at Mercur, has been issued, showing the following tonnage, by months, mined and milled during the fiscal year ended July 1, 1904:

	Tons.
July.....	24,478
August.....	23,786
September.....	21,992
October.....	22,821
November.....	24,306
December.....	21,787
1904—	
January.....	14,068
February.....	13,825
March.....	14,648
April.....	14,084
May.....	13,598
June.....	17,308
Total.....	226,701

The output for 1902-1903 was 346,359 tons. Just before beginning the fiscal year 1903-1904 reduction was made in the daily ton-

nage because eight of the mill's twenty-six leaching vats were taken for the slimes plant equipment. On January 1, 1904, owing to unsatisfactory grade of the base ore being produced, four of the nine roasters were shut down. By June conditions had improved, and so the tonnage was increased.—The financial statement shows \$648,516.48 in gold bullion produced, an extraction average of \$2.86 per ton. The tailings ran from \$0.80 to \$1.43, an average for the year of \$1.03. The tailings values are being lowered. The ore treated was the lowest average grade the company has yet treated. The ore as mined and milled did not come up to the values and tonnage as estimated for the ore reserves at the beginning of the fiscal year. In addition, there were premature cave-ins in certain of the stopes, making it impossible to get at much of the better grade ore.

The mining costs for the year were \$317,650.97, or \$1.40 per ton, and the milling costs \$362,069.42, or \$1.60 per ton. The slimes plant was closed down on May 26. The Manning mill, which is being maintained for working over tailings from the old Mercur mill, was not operated last year. It has been leased on a royalty basis, and is being again put in operation.—In the mine development work has been extended and systematic resampling done to show conclusively what blocks of ground could be counted on for ore. The known boundaries of existing ore bodies have been extended. G. H. Dern of Salt Lake City is manager. Mercur, Sept. 5.

### WASHINGTON.

#### Snohomish County.

Manager U. K. Loose of Snohomish says the mines of the Index M. Co. at Index will be equipped and operations resumed.

The Copper Independent Con. M. Co. of Boston, Mass., owning mines at Silverton, will reopen its property and remodel the mill.

### WYOMING.

#### Fremont County.

B. N. Tibbals of Chicago, Ill., manager of the Federal G. M. Co., operating at South Pass, reports he is increasing output of ore and development work.—It is reported the Carissa gold mine will be reopened.

#### Laramie County.

The shaft of the Fairview mine, near Hecla, in Silver Crown district, will be sunk to 1000 feet.—The mill of the Hecla C. & G. M. & M. Co. is running on ores from the Louise mine and concentrates are being shipped.

### FOREIGN.

#### AFRICA.

##### Algeria.

Official statistics state that the quick-silver mines at Taghit exported in 1903 twenty metric tons of mercury. Exports in 1904 will be much greater, says Manager Lagache.

##### Rhodesia.

The Rhodesian Chamber of mines, at Bulawayo, reports the gold output for month of July was 17,213 ounces from Matabeleland and 7126 ounces from Mashonaland, a total of 24,339 ounces—an increase of 3937 ounces compared with June.

##### Transvaal.

The Knights Deep mine, of the Consolidated G. F., Ltd., group, at Johannesburg, will put in a pumping plant to deliver 2,000,000 gallons of water per day against a static head of 1200 feet. The pump is to be coupled direct to a three-phase induction motor.

### AUSTRALIA.

#### New South Wales.

The Broken Hill Proprietary Co., operating at Broken Hill, reports half-yearly statements have been issued showing a profit for the six months ending May 31 of £107,698. Smelting operations at Port Pirie are satisfactory; bullion output for half-year shows 35,000 tons produced, an increase of 3742 tons pig lead, also 62,800 ounces fine silver over previous half-year. In view of the satisfactory results of experiments in sulphuric acid plant at Broken Hill, it has been decided to duplicate same, and then will be able to supply outside companies' requirements. The board will erect the plant at Port Pirie for manufacture of sulphuric acid. When arrangements are completed the probable output will be 12,000 tons chamber acid per annum. It is estimated the cost of putting in the machinery will be £15,000. In addition it has been decided to utilize the acid produced in manufacture of superphosphates. Exploratory work in the lower levels has proven satisfactory; quality of the ore equals the average.

The tonnage of ore raised shows increase over previous half-year. Salt Cake plant has been practically completed, and has a capacity for treating 2000 tons weekly. The company has taken a lease of limestone property to supply requirements of flux—1500 tons weekly. Average prices obtained during the half-year: Lead, 6s 3d per ton; silver, one-sixteenth of a penny per ounce fine, better than during previous half-year.

#### Victoria.

(Special Correspondence).—Bewick, Moreing & Co. of London, Eng., have secured control of about 30 miles of deep alluvial, or ancient river channel, in Victoria, and numerous bore holes have defined their limits with fair accuracy. The serious drawback to the operation of these channels, and the reason they were not long since worked out is the large amount of water on bedrock. It is believed, after investigation, however, that the channels can be drained by pumping, and it is thought that when the water has been once removed, as the climate is extremely dry, and the rainfall light, that no further trouble need be anticipated on that score. The bedrock of these channels is several hundred feet below the surface, and like many of the ancient rivers of California, they are covered with a heavy cap of lava, but unlike most of the California channels, the Australian channels cannot be drained by tunnels owing to the low topographical relief of the country. Some of the largest placer nuggets in the world have been found in the beds of these ancient streams where they were not flooded with water.

Ballarat, Aus., July 28.

#### Western Australia.

(Special Correspondence).—The Sons of Gwalia, Ltd., mine is at Leonora, 150 miles north from Kalgoorlie by rail. Water is pumped from the mine, and carries a high percentage of salt. Recently the company secured a well 2 miles from the mine, which furnishes a good supply of boiler water. Formerly the boiler water had to be condensed. Condensers are in operation at the mine to supply water for domestic use. A family is allowed 10 gallons daily, free, and a single man 5 gallons. A scrub tree called mulga grows in patches and furnishes the wood for the mines of this section. It is a very hard wood and excellent for firing purposes. The cost is equivalent to about \$6 per cord, but all firewood is sold by the ton and is weighed in.

The mill on the Sons of Gwalia is of 50 stamps, with Wilfley concentrating tables. The tailings are elevated by a sand wheel and then led to the cyanide vats. A double leaching treatment is used. At present the concentrates are being reground in pans, treated by cyanide agitation, and the whole filter-pressed, recovery being 90% of the assay values. An Edwards' roasting furnace is being built, to first roast the concentrates, after which they will be reground and cyanided by agitation. This is the process practiced at the Oroya-Brown Hill mine at Kalgoorlie (also controlled by Bewick, Moreing & Co.), where a recovery of 95% is obtained. The ore of the Sons of Gwalia mine averages 1 ounce gold per ton and the concentrates \$80 per ton.

All work is none in 8-hour shifts, and no work is done on Sundays or holidays. Leonora, Aug. 1.

Perth reports say the total amount of gold exported or received at the mint during July amounted to 192,306 ounces, valued, after refinement, at £682,688, as against 212,501 ounces, valued at £765,005, in July, 1903.

The Lake View Consols mine at Kalgoorlie reports for month of July 8900 tons (of 2000 pounds) of ore treated, yielding 4131 ounces fine gold. Costs—Ore extraction, 11s 8d per ton; ore reduction, 13s 8d per ton; refining of bullion, 3d per ton; total working expenses, £1 5s 7d per ton; expenditure on machinery and plant, £19; expenditure on mine development, £1873.

### BRITISH COLUMBIA.

#### Cassiar District.

W. J. Robinson, manager of the British America Dredging Co., operating on Pine creek, near Atlin, says work will be increased on Dixie creek. His company will build a dredger on Dixie creek. Water will be used for power development. The company also proposes operating two additional dredgers on the Atlin leases. The British Columbia Dredging Co. is building a dredger on Spruce creek.

#### East Kootenay District.

C. Fernau says he will build zinc enrichment works at Rosebery and a zinc smelter at Fernie. Site at Rosebery has been bought. The enrichment works are intended to further concentrate zinc concentrates. The higher percentage of zinc thus obtained is said to render the product more desirable from the smelter's

standpoint and reduces the bulk on which railroad tolls must be paid. The process of enrichment is based on standard concentrating practice, varied to meet the special ore in treatment. In construction of a zinc smelter the outlay on machinery is not large, less mechanical plant being required than in an ordinary lead smelter, owing to elimination of blowing apparatus. Exceptionally large and heavy furnaces of firebrick, however, are required. Firebricks are \$70 to \$80 per thousand at Fernie. At Fernie the fuel used in the furnaces will be gas. The latter fact is the reason for the erection of the works at Fernie near the coke ovens. The Fernie smelter will be built to finally handle 30,000 tons of zinc ores per annum. This tonnage is not available at present, hence the plant when ready for operation will be prepared to buy but 10,000 tons of zinc ores per year. The plant will produce spelter.

Roseland District.

At the White Bear mine, near Roseland, milling operations have started. Wilfley tables are being used and water has been brought to the mill through a 5-inch pipe from the Black Bear pond. The electrical power company put in two 75 H. P. motors in the mill. Some of the tanks to be employed in the Elmore process are in place, but the bulk of the oil machinery remains to be set up, completion of the water end of the works being first arranged.

Slocan District.

The Mayetta group, near Slocan City, has been sold, says the Slocan Drill, to R. J. McPhee et al. There are nine claims in the group, adjoining the Ottawa on the north. A tunnel has been driven on the Aricle to cut a surface cropping of quartz.

Vancouver Island.

The Marble Bay M. Co. reports developing and shipping bodies of ore carrying copper, gold and silver values in its mines at Marble Bay on Van Anda island. A depth of 500 feet has been reached. L. A. Grant is manager. The Copper Queen, near Marble Bay, is also producing ore. Equipment is being increased.

West Kootenay District.

A strike is reported made on the Hecklar mine, owned by C. Brace and J. Ellersick of Spokane, Wash. It is in the Rapid Creek district, 1½ mile from Poplar. They have opened 3 feet of ore carrying free gold. They will have twenty men at work and will put up buildings.

A strike has been made on the Morning mine, owned by McIntosh, Nesbitt & Co. This property has been taking out gold ore, but they have opened another ledge with 3 feet of galena, carrying silver and gold.

Cambourne reports say forest fires have destroyed the tramway of the Goldfinch mine near there, and also a portion of the Eva mine's aerial tramway. The Eva group is owned by the Calumet & British Columbia M. Co. of Nelson, J. F. Musselman manager. The Goldfinch mine is owned by the Goldfinch M. Co.

Yale District.

The Mount Baker & Yale M. Co.'s 10-stamp mill at Siwash creek is set up, says the Inland Sentinel, and is expected to be operating next week. The company's sawmill has been running two months cutting lumber for camp buildings and the mill. Men are stripping the vein which has been crosscut in four places. The Mount Baker & Yale M. Co. has built a road from the Fraser river to the mine and stretched a cable across the river.

Milling is under way at the concentrating works of the Iron Mask mine at Kamloops. There are 100 men working underground, with G. W. Fisher as foreman. The workings include development down to the 600-foot level and the equipment includes a compressor plant, mill and boarding house. The concentrator has a capacity of 300 tons of ore per twenty-four hours.

CANADA.

Alberta.

R. W. Hinton of Roseland, B. C., mechanical engineer for the Pacific Coal Co. at Banff, says he will put in an air compressor plant at the Bankhead collieries.

Nova Scotia.

Guilford & Kelley, who have bought the Colonial M. Co. property at Moose river in Caribou district, say they have completed their 40-stamp mill on the Archibald mine. The Touguoy G. M. Co. at Moose river is sinking a vertical shaft and will drift in under the old workings.

The Mic-Mac gold mine at Bridgewater reports for nine months ended March 1, 1904, producing a total of \$31,392 in gold. Water power has been brought from the Port Medway river and will be converted

into electricity. The equipment has been improved.

Ontario.

It is said the International Nickel Co., operating nickel and copper deposits at Sudbury, Copper Cliff and Constable Head, will build a copper refining plant to handle output of its mines and smelters instead of shipping to the United States as at present. The refinery will be built at Copper Cliff, to be run by water power from the Spanish river and transmitted 50 miles to Copper Cliff. At Copper Cliff, 3 miles from Sudbury, an additional smelting plant consisting of two 500-ton copper furnaces is about completed. The matte is treated in Bessemer converters.

INDIA.

Outputs for month of July are reported for principal mines at Kolar: Balaghat Gold—3010 tons of quartz produced 2351 ounces of gold; 2380 tons of tailings (cyanide process) produced 227 ounces of gold; total 2578 ounces. Champion Reef—15,510 tons of ore produced 15,379 ounces of gold; 20,176 tons of tailings (cyanide process) produced 2603 ounces of gold; total 17,982 ounces. Coromandel—1370 tons yielded 404 ounces of gold; 1020 tons of tailings yielded 47 ounces of gold; total 451 ounces. Mysore—16,000 tons ore produced 15,503 ounces; 11,882 tons of tailings (cyanide process) produced 1250 ounces; total 16,753 ounces. Nundydroog—6400 tons produced 5088 ounces; 5018 tons of tailings (cyanided) produced 497 ounces; total 5585 ounces. Ooregum—10,818 tons ore produced 5100 ounces; 10,228 tons of tailings (cyanided) produced 1011 ounces; total 6111 ounces.

MEXICO.

Chihuahua.

The Hidalgo M. Co. of Parral has put up a gas plant at its Moreno mine, and will add a similar plant of 150 H. P. at its Alferena mine.

L. A. Beachel et al. of El Paso, Tex., have organized a company to operate the Victoria group of mines, 25 miles from Minaca, on the Chihuahua & Pacific railway. A smelter will be built. A silver-lead ore is produced, carrying copper values.

A strike is reported at the Cocheno mines at Cocheno, in Jesus Maria district. The vein is 35 feet wide and carries gold and silver. The mine is owned by the Standard Oil Co. There is a 60-stamp mill at the mine and a cyanide plant of 300 tons capacity per day. The bullion is carried on muleback 70 miles to Minaca.

The Calera mine, 12 miles from Minaca, owned by the Calera M. Co., is being worked for zinc. G. W. Phillips is manager. A spur will be built from the Chihuahua & Pacific Railroad extension and the Calera Co. will build reduction works. The ore also carries silver values.

Durango.

It is reported the Catorce Marcos, San Cayetano and La Cumbre mines, in Parilla, near Vacas, have been sold for \$75,000 gold, and machinery is being put in. A. E. McCaughan is interested. At Topia the Madrugada mine of the Miller & Sibley Co. of Bradford, Pa., has shown up a body of silver-lead ore. The increase of new work in Guanacevi district has induced the Mexican International Railroad to build its road into that district.

The Santo Domingo and Hay tunnel, adjoining the Velardena mine, at Velardena, has been bought by O. Koehler, O. Wahrmond and S. D. Bridge of the Jimulco M. Co., and will be worked under D. C. Irish. The American-Mexican M. & Dev. Co., which has option on ground for a smelter in Torreon, is planning a pyritic smelter for Velardena. The Avino mines are temporarily closed while a gas plant and engines are being installed. W. B. Jeffries is manager, and F. Fletcher, consulting engineer.

Guerrero.

Superintendent J. Brennon is building a 50-ton mill at the Ajuchitlan M. Co. mines at Ajuchitlan.

Jalisco.

At Ahualco the Fortuna M. Co. and the Pozas M. Co. report their mills nearing completion. They expect to start running before Oct 1.

C. Carroll of Guadalajara will open up a grindstone quarry 70 kilometers northwest of Guadalajara. Owing to lack of transportation facilities, the construction of an electric railroad from Guadalajara to the quarry is proposed.

J. J. Mann of Philadelphia, Pa., has bought a half interest in the San Pablo group of mines near Etzatlan and will increase equipment for development work.

Lower California.

The water jacket smelter, machinery and other equipment of the San Diego S. & R. Co., at San Diego, Cal., have been taken apart and shipped to Santo Domingo, to be used in connection with mines owned by G. P. Brown and the Es-

peranza M. Co., on the main land. The Esperanza company has been mining on Cedros island, but has also bought copper mines on the main land. At the smelter site the company has ample supply of water.

Nuevo Leon.

The Garza group of mines on Las Miras mountain, near Monterey, has been sold to the Minas Nuevas de Nuevo Leon, of which E. Doerr is president.

Puebla.

An electric line has been built from Tezuitlan to the works of the Tezuitlan C. Co. at La Aurora. The power is taken from the Atexaco river. E. R. Dalbey is manager and A. F. Schneider will superintend. The company has 800 men at work. The ore carries copper, silver and gold values and is developed principally by tunnels. The smelter has capacity of 250 tons daily.

Sonora.

The Santa Margarita M. Co. of Cananea, H. C. Rolfe manager, operating at Santa Margarita, near La Colorada, has four ledges from 8 to 12 feet wide. The tops of the ledges show extensive antigua workings. The ores assay in copper, silver and gold. A tunnel has been run 300 feet to cut the ledge below bottom of shaft. When connection is made the shaft will be continued, hoisting to the tunnel level and discharging through that. From the smelter site in the canyon a tunnel 1000 feet long will be driven to cut all the ledges at 1000 feet below croppings. A reduction plant will be built and the ore will go down by tramway. La Barranca, with its beds of anthracite, suitable for smelting, is 18 miles from Santa Margarita.

The Lucky Tiger G. M. Co., near Moctezuma, will build a combination quartz mill—stamps and rolls—with a daily capacity of 100 tons. B. F. Graham of Naco, Ariz., is manager.

At the Greene placers on the San Domingo river, owned by W. C. Greene of Cananea, the pay streak is reported from 2 to 8 inches thick. The waste covering the pay dirt will be removed and the gold collected by hydraulicicking. Installation of machinery has ceased temporarily, owing to high water. As soon as the rainy season ends work will be resumed.

NEW ZEALAND.

The New Zealand Mines Record reports the export of gold from New Zealand for the first six months of 1904 amounted to 267,305 ounces, as against 257,198 ounces for same period of 1903. In Otago and Southland districts there was an average of fifty-five gold dredgers in operation, producing about 1650 ounces gold weekly, or a total for the first six months of 1904 of 43,567 ounces. In West Coast district during same period an average of twenty-two dredgers produced about 580 ounces weekly, or a total of 15,142 ounces gold.

The Talisman Con. reports for month of July: Tons of ore treated, 3975; value of bullion, \$6886; cost of mining, milling, cyaniding and general expenses, \$4689. Other expenditure: Normal mine development, \$808; special development work, \$467.

PERU.

A. W. McCune, manager of the Cerro de Pasco M. Co. at Cerro de Pasco, says the railroad from Lima was completed in July and opened for through traffic about Aug. 1. Work on the smelter is progressing, but it is not expected to be ready for operation before next spring. The mines are 200 miles northeast of Lima. To reach the mines from Lima, the Andes range of mountains has to be crossed at an altitude of 15,665 feet. There are about 4000 men working in and about the mine, the erection of the smelter and the construction and operation of the railroad. About 1000 of them are working about the mines and smelter. The nearest coal mine is 8 miles, the main coal properties, however, being 22 miles away, due north from the smelter and mine. The coal is bituminous. There is no timber in that section and all the mining timber used by the company comes from Washington, says McCune. The latest developments show average of 20% in copper and sixteen ounces in silver. There are 400 or 500 claims in the group, which covers an area of about 1½ mile square, the extent of a single claim being 30x80 meters (32½x86½ yards). Many of the mines in the group have been worked for 274 years. The titles in nearly all instances are possessory in their nature, having been originally handed down from the old Spanish Government. The chain of title to 12 miles square of ground can be traced back for 300 years. Cerro de Pasco, where the mines are, is in the center of the tract. To save litigation which might arise out of questions of boundaries the company has bought up the entire tract. J. B. Haggin of New York is president.

Commercial Paragraphs.

THE Friedrichstadt shipyard (of J. & A. Jensen ag Dahl, Kristiania), one of the largest in Norway, has placed a two-year contract with the Ingersoll-Sergeant Drill Co. for the Haessler pneumatic hammers and drills.

THE Kimpen Crusher & Pulverizer Co., 100 Washington street, Chicago, have sold to the Esmeralda Copper Precipitating Co. one of their 74 "K" mills (pulverizer), which they intend to put in at their mill now building at Sodaville, Nev.

"PITFALLS OF MINING FINANCE," by H. J. Newton, Denver, Colo., in 156 pages discusses the devious ways of deception sometimes adopted by men who work the street, and not the mine, and who impose on the credulous and ignorant. It is sold by its publisher for 50 cents per copy.

THE Denver Engineering Works Co. announce that, in order to expedite the handling of its constantly increasing business, it has appointed Lyman P. Hammond as sales manager. Mr. Hammond has resigned his position as manager of the Denver branch of the Crocker-Wheeler Co., and will take charge of all work relating to the sale of the Denver Engineering Works Co.'s products after September 15. He will be located at the city office of the company, 604-605 McPhee Building, Denver. Mr. Hammond has had a broad experience in the manufacturing industry, and has made a good record in the sale of Crocker-Wheeler apparatus. He will be congratulated by all who are acquainted with the members of the Denver Engineering Works Co. and its products.

THE Ingersoll-Sergeant Drill Co. offers five prizes for advertisements best suited to their requirements. Any stockholder or employee of a company, firm or individual using Ingersoll-Sergeant machinery, or any one in the employ of the Ingersoll-Sergeant Co., will be at liberty to submit suggestions. Each advertisement should be prepared for a particular trade paper, designed to fill the same space as the company's regular advertisement in that paper. Any of the following papers may be selected: MINING AND SCIENTIFIC PRESS, American Machinist, Compressed Air, Engineering Magazine, Engineering News, Engineering and Mining Journal, Granite, Mines and Minerals, Railroad Gazette, Railway Age and Rock Products. The excellence of the advertisement will be determined by the subject matter, its arrangement and its appropriateness for the publication for which it is designed. The prizes will be as follows: First prize, \$25; second prize, \$10; third, fourth and fifth prizes, \$5 each. In addition, a prize of \$10 will be awarded for the best and most original suggestion for keeping the name of the Ingersoll-Sergeant Drill Co. before the public. Selections will be made from the advertisements received, and they will be published. The final choice will be made from among the advertisements which have appeared in print. The competition will close November 1, and the awards will be made as soon after that time as possible. They reserve the right to copyright and use any of the advertisements submitted. Send to the publication department of the Ingersoll-Sergeant Drill Co., 26 Cortlandt street, New York.

Trade Treatises.

Jeffrey grab buckets are finely illustrated in a brochure from the Jeffrey Manufacturing Co., Columbus, O.

"As the Photographer Saw Us," with price list, forms a good exposition of the work in the establishment of the Guarantee Electric Co., Adams and Clinton streets, Chicago.

A. S. Cooper, 219 Crocker Building, San Francisco, Cal., has issued an illustrated description of his patent gas lift to increase the flow of wells which yield artesian water and natural gas.

The different styles of mine cars and mining car fittings made by the Watt Mining Car Wheel Co., Barnesville, O., are fittingly portrayed in a finely engraved booklet from that company.

The September number of Graphite contains some interesting talks on the preservation of metal surfaces with Dixon's silica-graphite paint. There are several excellent illustrations in halftone of fine steel structures, and use thereon of silica-graphite paint is well exemplified. This publication will be sent free of charge upon request by the Joseph Dixon Crucible Co., Jersey City, N. J.

## Personal.

H. M. DAVEY is building the furnaces for the Marysville, B. C., smelter.

C. DURELL is manager of the Gold Reef M. Co., at Lewistown, Mont.

W. R. GLEASON is metallurgist at the Blue Bird mine, near Sumpter, Or.

W. JENKINS is superintendent of the Home C. Co., operating near Morenci, Ariz.

A. H. JONES is chemist at the Dorcas mill at Florence, Colo., vice D. Walser, resigned.

H. C. PLUMMER is superintendent of the Franklin gravel mine, near Placerville, Cal.

R. H. CHANNING, JR., is manager for the Utah Con. M. Co., operating at Bingham, Utah.

F. L. MINER is superintendent of the St. Paul M. Co., operating at Georgetown, Colo.

O. DENNHARDT is with the Cripple Creek-Homestake M. Co., at Cripple Creek, Colo.

EDW. M. CAPPS, a hydraulic engineer, has removed from Los Angeles, Cal., to Seattle, Wash.

A. LARSON is manager of the Velvet mines and mill on Sophie mountain, near Rossland, B. C.

B. F. THOMAS of Los Angeles, Cal., is at Magdalena, Sonora, Mex., examining mining interests.

E. H. BALLOU goes from Igo, Cal., to Pony, Montana, to take charge of mining operations there.

L. W. FELT, manager of the El Recreo copper mines at Mantanzas, Cuba, is visiting mines in Colo.

O. SANNE is assistant engineer for the Scherzer Rolling-Lift Bridge Co., with offices in Chicago, Ill.

J. SKEVES is superintendent of the mines of the Mohegan - Gold Flat M. Co., near Grass Valley, Cal.

A. MIDDLEBROOK, manager Denver branch Jeanesville Iron Works Co., was in San Francisco last week.

T. R. RUSSELL has resigned as superintendent of the Western Fuel Co. collieries at Nanaimo, Vancouver Island, B. C.

H. C. HOOVER, of the firm of Bewick, Moreing & Co. of London, England, is in S. Utah Africa on professional business.

T. WEARNE, recently with the Tamarrack C. Co., is head mining captain for the Superior C. Co. of Houghton, Mich.

W. W. ELLIOTT of Prescott, Ariz., is mill superintendent of El Tigre M. Co., operating in Moctezuma district, Sonora, Mex.

D. WALSER has resigned as chemist at the Dorcas mill at Florence, Colo., and has gone to Butte, Mont., to engage in similar work.

F. WEED, recently with the Annie Laurie mine, near Marysville, Utah, is superintendent of the Dumont-Boston mill at Dumont, Colo.

T. M. CHILDERS of Silver City, N. M., is manager of the mines of the New Idea G. M. & M. Co. operating at Turkey, Yavapai Co., Ariz.

JESSE J. MACDONALD has returned from Baja California and has taken the position of consulting engineer for the Gold M. Co., Dale, Cal.

E. A. SJOSTEDT is chief metallurgist for the Lake Superior Corporation and allied companies, with offices at Sault Ste. Marie, Ontario, Canada.

H. S. KERR is manager of the railroad of the Cerro de Pasco M. Co., operating between Lima and the company's mines at Cerro de Pasco, Peru.

H. A. GUESS has resigned as chemist for the Silver Lake mines, at Silverton, Colo., and has gone to Cananea, Sonora, Mex., as chief chemist for the Cananea Con. C. Co.

W. H. DAVIES, superintendent of the Statehood M. Co., operating in the Greenlee district, has returned to Morenci, Ariz., from Los Angeles, Cal., on company business.

P. GALVAN, formerly with engineering corps of the Illinois Central Railway, has been appointed chief assistant in the Engineers' Department of the Panama Canal Commission.

J. A. DIGGLES, recently metallurgist for the Melones M. Co. at Melones, Cal., is superintendent of the reduction works

of the Sons of Gwalia, Ltd., at Leonora, Western Australia.

R. W. HINTON, master mechanic in charge of the Velvet-Portland concentrator, at Rossland, B. C., has been engaged as mechanical engineer by the Pacific Coal Co. at Banff, Alberta, Canada.

P. M. MCCREE, formerly superintendent of the Commercial mine at Bingham, Utah, and recently in Tintic district, is superintendent of the mines of the Bingham & New Haven M. Co. at Bingham, Utah.

W. A. PRITCHARD, E. M., general manager for Bewick, Moreing & Co. of London, England, left San Francisco, Cal., Thursday, the 8th inst., for Kalgoolie via New Zealand and Sydney. Mr. Pritchard had just returned from Europe.

F. L. BOSQUI, has returned to San Francisco, Cal., from an inspection of the mines, at Gold Roads, Mohave county, Ariz., where he went in a consulting capacity to advise as to a change in the method of ore treatment. He has gone to Goldfield, Nev., to install a cyanide plant on the Combination mines.

E. H. BENJAMIN AND CHAS. G. YALE of San Francisco, Cal., who have been appointed members of the International Jury of Awards at the St. Louis Exposition, have left for St. Louis. Mr. Yale is also a delegate from California to the International Geographic Congress, meeting this fall at New York, Philadelphia, Niagara Falls, Washington, Pittsburgh and St. Louis.

## Books Received.

Under the head of Mineral Resources for 1903 the U. S. Geological Survey has issued "Production of Iron Ores;" "Production of Fluorspar and Cryolite;" "Production of Lithium;" "Production of Barytes, with a Note on Strontium;" "Production of Manganese Ores."

## Obituary.

J. MCGOWAN, a pioneer miner of Eureka, Nev., died in Eureka August 24. Deceased was a native of Vermont, aged 81 years. He went to Eureka thirty-three years ago and engaged in mining in Secret canyon.

## Dividends.

The Bunker Hill & Sullivan M. & C. Co., dividend No. 83, \$75,000, Sept. 3rd. Total paid since Jan. 1st, 1904, \$513,000, and total to date \$2,046,000.

## Latest Market Reports.

SAN FRANCISCO, September 9, 1904.

### METALS.

SILVER.—Per oz., Troy: London, 26½d (standard ounce, 925 fine); New York, bar silver, 56½c, refined (1000 fine); San Francisco, 56½c; Mexican dollars, 47½c San Francisco, 45½c New York.

COPPER.—New York: Standard, \$12.75; Lake, 1 to 3 casks, \$12.75; Electrolytic, 1 to 3 casks, \$12.75; Casting, 1 to 3 casks, \$12.50; San Francisco: \$15.00. Mill copper plates, \$17.00; bars, 18@24c. London: £57 1s spot per ton.

LEAD.—New York, \$4.30; Salt Lake City, \$3.50; St. Louis, \$4.12; San Francisco, \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½c; pig, \$4.85. London: £11 13s 9d long ton.

SPELTER.—New York, \$5.12; St. Louis, \$5.00; London, £22 16s 3d per ton; San Francisco, ton lots, 6½c; 100-lb. lots, 7c.

TIN.—New York, pig, \$27.60@27.70; San Francisco, ton lots, 28c; 500 lbs., 28½c; 200 lbs., 29c; less, 29½c; bar tin, \$30@32½c. London, £126 2s 6d spot.

PLATINUM.—San Francisco, crude, \$18.50 per oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75@82c per gram.

QUICKSILVER.—New York, \$42.00@44.00, large lots; London, £7 15s San Francisco, local, \$41.50@42.50 per flask of 75 lbs.; Denver, \$45.00. Export, \$41.50@42.50. BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 31½c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 17.75c; San Francisco, Plumbers', 100-lb. lots, 15.25c.

ZINC.—Metallic, chemically pure, \$1.50, 50c; dust, \$1.10; sulphate, \$1.10, .04c.

NICKEL.—New York, 40@47c per lb.; ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 31@34c.

### STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$12.85 @13.20; gray forge, \$12.00; San Francisco, bar, 3c per lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$23.00@23.00; open hearth billets, \$23.00 @23.00; San Francisco, bar, 7c to 12c per lb.

LUMBER.—(Retail): Pine, ordinary sizes, \$24.00@25.00; extra sizes higher; redwood, \$28.00@30.00; lath, 4 feet, \$4.50 @5.00; pickets, \$21.00; shingles, \$2.50 for No. 1 and \$2.25 for No. 2; shakes, \$13.50 for split and \$15.00 for sawed; rustic, \$28.00 @35.00.

NAILS.—This week the basic prices are: Wire, \$2.77; Cut, \$3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, \$3.35; Cut, \$3.55; 10d to 16d, Wire, \$3.45; Cut, \$3.35; 8d Wire, \$3.50; Cut, \$3.50; 6d and 7d, Wire, \$3.60; Cut, \$3.60; 4 and 5d, Wire, \$3.70; Cut, \$3.70; 3d, Wire, \$3.85; Cut, \$3.85; 2d, Wire, \$4.10; Cut, \$4.10. Special rates for carload lots.

LIME.—Santa Cruz, \$1.25 country, \$1.25 city per bbl.

CEMENT.—Imported, \$2.15@2.65 per bbl.; California carload lots, \$2.10 f. o. b. at works; small lots, \$2.40 per bbl. in sacks, 4 sacks to bbl., 10c for each sack returned.

### GENERAL SUPPLIES.

ANTIMONY.—New York, Cookson's, 7½c; Hallett's, 6½c; San Francisco, 1000-lb. lots, 8c; 300@500-lb., 8½c; 100-lb. lots, 10½c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1\*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1\*\* 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9c; less than one ton, 11½c. No. 2\*\* 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2.00 per keg.

CAPS.—3x, \$5.50@6 per 1000; 4x, \$6.50 @7; 5x, \$8@8.50; Lion, \$9@9.50, in lots not less than 1000.

FUSE.—Triple tape, \$4.00 per 1000 feet; double tape, \$3.50; single tape, \$3.10; Hemp, \$2.75; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11½c per set; 14 oz., 40s., 10c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 23@24c per lb.; carloads, 23@23½c; in tins, 30c; soda ash, \$2.00 per 100 lbs.; hyposulphite of soda, 3@3½c per lb.; caustic soda, in drums, 3@3½c per lb.; Cal. s. soda, bbls., \$1.20@1.40 per 100 lbs.; sks., \$1.05; chlorate of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2¾c; powdered sulphur, 2@3c; flour sulphur, French, 3½@3¾c; alum, \$2.00@2.25; California refined, 1½@2c; sulphide of iron, 8c per lb.; copper sulphate, 5½@5¾c; chloride of lime, spot, \$2.50@2.75; sulphuric acid, in carboys, 66½ B, 1¼@2c per lb.; nitric acid, carboys, 8c per lb.

COAL.—San Francisco, coast, yard prices: Wellington, \$8.00; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallend, \$7.50; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8.00; Cumberland, \$13.00; Cannel, \$8.50; Welsh Anthracite, \$13.00; Rock Springs, \$8.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13.00 in sacks; Sunnyside, \$8.50, long ton.

OILS.—Linseed, boiled, bbl., 57c; cs., 62c; raw, bbl., 55c; cs., 60c; Lucol oil boiled, bbl., 50c; cs., 55c; raw, bbl., 48c; cs., 53c. Kerosene—Pearl, per gal., 19½c; Astral, 19½c; Star, 19½c; Extra Star, 24c; Eocene, 23c; Elaine, 26c; Water White, in bulk, 13½c; Mineral Seal, iron bbls., 18c; wooden bbls., 20½c; cs., 24c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22½c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 13c; do., in cs., 19½c; Lard Oil, E. W. S., bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Sperm, crude, 63@68c; Natural White, 63c; Bleached, do., 57c; Whale Oil, cs., 52@57c.

ALUMINUM.—No. 1, 99%, small lots, 37c per lb.; 100 lbs., 35c; 1000 lbs., 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

BORAX.—Concentrated, 6@7c per lb.; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

BONE ASH.—Extra No. 1, 5@6c per lb., No. 1, 4@5c.

RED LEAD.—500 lbs. and over at one purchase, \$1.10, 7c; less than 500 lbs., 7½c.

LITHARGE.—Pure, in 25-lb. bags, 8@9c per lb.

MOLYBDENUM.—Best, \$2.00 per lb.

CHROMIUM.—90% and over, \$1.80, 80c.

PHOSPHORUS.—American, \$1.10, 70c.

SILVER.—Chloride, \$1.00, 90c@1.00; nitrate, 55c.

MERCURY.—Bichloride, \$1.10, 77c.

MAGNESIUM.—Pure, N. Y., 60c.

MANGANESE.—\$1.10, 75c.

SODIUM.—Metal, \$1.10, 50c.

BISMUTH.—Subnitrate, \$1.10, \$2.10.

URANIUM.—Oxide, \$1.10, \$3.50.

FIRE BRICK.—Domestic, carloads per 1000, f. o. b., factory square, \$25.00; soap and split, \$22.50; arch and wedge, \$27.50; skewback, \$30.00; circle, \$32.00.

FIRE CLAY.—Domestic, per ton 2000 lbs. in 125-lb. bags, double, and dry ground, f. o. b., factory, \$8.50.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

## New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR THE WEEK ENDING AUGUST 30, 1904.

768,648.—TURBINE—D. F. Anbury, Seattle, Wash.  
768,649.—SPIKE EXTRACTOR—E. Hebler, Los Angeles, Cal.  
768,737.—CAN LAPPING MACHINE—F. A. Dixon, San Jose, Cal.  
768,789.—TROLLEY POLE CONTROLLER—M. O. Dolson, Los Angeles, Cal.  
769,064.—RAILWAY TIE—Dowell & Morrison, Roseburg, Or.  
769,065.—BED BOTTOM—J. W. Eflaw, Seattle, Wash.  
768,784.—BOTTLE-F. Franz, S. F.  
768,988.—HYDROCARBON LAMP—Grant & Stewart, Portland, Or.  
768,997.—CURVED CARRIER—C. H. Gund, Angels, Cal.  
769,082.—ROTARY ENGINE—C. Hendricks, Riverside, Cal.  
768,900.—SPLIT PULLEY—S. C. Hitchcock, Tacoma, Wash.  
768,663.—SAW PROTECTOR—J. A. Jackson, Oakland, Cal.  
769,095.—HILLING MACHINE—H. Kurth, Portland, Or.  
768,794.—ELECTROSTAT—G. I. Leonard, Pasadena, Cal.  
768,815.—POWER SET WORKS—H. McCleary, Tacoma, Wash.  
769,008.—SAW TEETH—J. & D. D. McMaster, Seattle, Wash.  
768,766.—HOSE SUPPORTER—Mensor & Greenblatt, Seattle, Wash.  
768,767.—GARMENT SUPPORTER—Mensor, Greenblatt & Potts, Seattle, Wash.  
768,768.—SOUND TRANSMITTER—T. R. Owen, Los Angeles, Cal.  
769,014.—CONVEYOR—W. E. Pedley, Riverside, Cal.  
768,820.—LUBRICATING DEVICE—E. A. Rix, S. F.  
769,022.—TYPE CARRIER—C. S. Rosin, Tacoma, Wash.  
768,712.—OIL BURNER—A. C. Rush, Los Angeles, Cal.  
768,776.—MOP WRINGER—C. E. Shaw, Spokane, Wash.  
768,701.—WAVE POWER—J. H. Smith, Los Angeles, Cal.  
768,836.—CASTRATING TOOL—F. Start, Fossil, Or.  
768,707.—BAND SAWMILL—E. F. Thomas, Tacoma, Wash.  
768,638.—WOOL CONVEYOR—J. H. Tillinghast, Stockton, Cal.  
768,640.—SHOVEL PLOW—W. G. Tower, Corona, Cal.  
768,711.—ELECTRIC MOTOR—F. C. Watkins, Vallejo, Cal.  
768,763.—RAILWAY SIGNAL—Watkins & Bethel, Seattle, Wash.  
768,785.—PIANO ACTION—J. L. Wilson, Los Angeles, Cal.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

OIL BURNER.—No. 768,280. Aug. 23, 1904. F. W. Hitchings and D. B. Ellsworth of Corralton, Cal. This invention relates to improvements in hydrocarbon burners for use in stoves, furnaces and the like. Its object is to provide a simple, compact, attractive and effective burner of the type employing steam to vaporize the oil for use particularly in conjunction with stoves, and which may be arranged outside of the stove, so as to take up the least possible amount of room.

NON-REFILLABLE BOTTLE.—No. 768,794. August 30, 1904. F. Franz, San Francisco, Cal. Assigned to Non-Refillable Bottle Co. of San Francisco, Cal., a corporation of California. This invention consists of a peculiarly shaped casing and a bottle neck so formed that the casing may be permanently locked therein. Said casing has a bottom provided with a central hole with an annular upturned

THE CALIFORNIA DEBRIS COMMISSION having received application to mine by hydraulic process from Jas. C. Hager, in Mount Pleasant Mine, near Spanish Ranch, Plumas county, Cal., draining into Spanish Creek which reaches Feather River, gives notice that a meeting to receive any protests will be held at Room 96 Flood Building, San Francisco, Cal., Sept. 23, 1904, at 1:30 P. M.

## Power in Arid Regions.

One of the most important factors in mining operations is the cost of power. In various districts this problem is solved in different ways. Without doubt free water power is the most desirable, as it is steady, and the cost is reduced to the expense of maintenance, after the installation has been made. Next to free water power is probably water power which is paid for at a stated price per unit of water used—usually the miner's inch or 1.5 cubic feet per minute. Water power is preferable for the reason that the cost of installation is usually relatively cheap, and repairs do not constitute an important item in a well arranged plant. As between steam and electricity, the cost of producing or securing either generally determines which shall be used. In desert regions it is often expedient to resort to still other means for power. An interesting instance is that of the Moctezuma Copper Co., at Nacozari, Mexico. In that case the surrounding conditions determined the kind of plant and the cost of generating power there. While the water supply is sufficient for all purposes during the greater part of the year, during the dry season it fails, and in some seasons no water is visible in the stream beds on the surface. It was known that during the rainy season transportation by wagon from the railroad, then at a distance of 90 miles, was almost impossible and the cost of fuel for power and for smelting operations under existing conditions would be high. The principal fuel supply was limited to scrub oak, but even this was not cheaply available owing to the rugged character of the country. As the amount of wood which could be obtained was evidently insufficient and, although

Mine and Concentrator, Moctezuma Copper Co., Nacozari, Sonora, Mex. Co.

cheaper than coal as far as it went, coal would also be necessary, it was determined to ship in all the coal required for all purposes.

After much experimenting, it was determined to adopt gas engines as a means of motive power, and the wisdom of this type of power installation under such conditions as obtained at that time at Nacozari has been abundantly proven. A number of gas engines are employed, each having a single cylinder 18.5 inches diameter and 24 inches stroke, run at 200

revolutions per minute. Each engine is belted to a 65 K. W. direct-current generator. The current is distributed at 250 volts to upwards of fifty motors situated in different parts of the works. These range in power from 5 to 175 H. P. The gas engines are started by compressed air, which has been found a convenient and simple means of accomplishing this, sometimes, troublesome feat. A single air receiver answers for this purpose, the pressure being maintained at about ninety pounds. The compressor is run by a motor and is controlled automatically. As accessory to the compressor is a steam-driven locomotive air pump, with which the plant was started. The water jackets of compressor and engines are supplied with a steady pressure from tanks located outside the building, each engine having its own tank, the water flowing under a 20-foot head. Both inlet and outlet of the jackets are connected by pipes to the bottom of its tank and by this means the water is kept in circulation. The tanks are of large area—18 by 11 feet, and 3 feet deep.

The gas engines are driven by gas made in producers at the works. The producers make both what is known as water gas and producer gas. In making the former steam is employed. When the fires become very hot the steam is turned in and the making of water gas begins. When the steam has cooled the fires to such an extent that the steam passes through without entering into combination with the gas, it is shut off and the making of producer gas continues as before. In this manner the gas making is intermittent. The amount of producer gas made greatly exceeds that of the water gas. A 15,000-cubic foot gas holder takes the producer gas, and one of 5000 cubic feet capacity receives the water gas, the pipe lines being so arranged as to turn the gas into either of the holders. The two gases are admitted into the mains leading to the engines in the proper proportions, to obviate as far as possible great dissimilarity in the quality of gas utilized in power making. The concentrator of the company shown in one of the accompanying engravings has a capacity of 600 tons daily. It is stated that this mill saves about 90% of the original assay value of the ores treated. The machinery of the concentrator is driven by electric motors. The smelter is 5 miles distant from the mines, with which it is connected by narrow gauge railroad. One of the accompanying engravings shows the surface gravity tram at one of the mines and that on page 193 is an illustration of the main shaft of the company. These engravings were made from photos furnished through the courtesy of W. R. Humphries, photographer, of Bisbee, Arizona.

## Depreciation of Mining Plants.

A question in which all mine owners, whether individuals or corporations, are interested is: What will be the life of a newly installed plant? Prior to 1890 it was figured that the life of a mill or hoist was practically about ten years, and it was at that time, and has since been, the custom to "write off" about 10% of the first cost annually, and to provide for its renewal it has been the habit of well-managed concerns, where mining operations are profitable, to set aside annually an amount equal to about one-tenth the cost of the mill. As a matter of fact with a properly constructed, modern plant, the life of the greater part of the machinery, and particularly the more massive part, should greatly exceed ten years, while a plant carelessly constructed will not, perhaps, endure one-half that time. Moreover, the personal equation is a large one. A mill man who does not keep his shafting lined up will possibly have to renew the shafting much sooner than ten years from the date of its installation. If the stamps are permitted to drop on the dies instead of on ore the renewal of stems at frequent intervals will be unavoidable. If concentrators are not kept as clean as possible they will prove to be short lived, and they seldom outlast the ten-year limit, owing to the constant and comparatively violent vibrations incident to their operation. Grit is an important factor also. Rock breakers will last a greater or less length of time according to the treatment they receive. The modern heavy mortar with properly arranged liners may last twenty years, or even longer, if no serious flaws or cracks develop in the casting, whereas, the mortar of twenty years ago did well if it remained in constant use for five years before it required renewal. In the matter of compressors and steam engines there is a wide range of endurance. First-class machinery, sufficiently heavy for the duty required of it, may be ruined by bad setting. In this class of machinery the personal equation is even a larger factor than in the care of mill machinery. A compressor set on a light and insecure foundation will not endure, for in a few months, or even weeks, signs of weak-

ness will become evident, and the management may be considered fortunate if breakages do not occur. Anchored to a solid concrete foundation of ample proportions a compressor should show no sign of movement whatever in years. There are other factors equally important, however, in the life of a compressor. These are the government of speed, the lubrication of the cylinders and the free and abundant flow of water through the jackets. Should a compressor run at a speed much beyond the limit for which it is built serious damage may result. Failure to abundantly lubricate the cylinders with the proper kind of oil is also detrimental to the machine, and if the practice is continued it will probably result in a heavy bill for repairs. The same thing may be said of a steam engine. It requires proper setting on a substantial foundation, and in the case of hoisting engines, where the machine is not self contained, and is not wholly on a single bedplate, extreme care is necessary in securing proper alignment of the several parts when setting up or undue heating and consequent wear, with probable breakage of gears, will result. If properly set it must receive care, and its life is likely to be directly proportional to the kind of care bestowed upon it. Boilers will probably not greatly exceed the ten-year limit, though in some instances going beyond it. Boilers have been used steadily for forty years; but long life can only be hoped for where the feed water is free from substances which will corrode the sheets and will not deposit dangerous scale. Other causes of rapid deterioration are the tendency to accumulation of scale, mud or grease on the plates over or near the fire, causing thereby a "bagging" of the plates, leakage seams, and sometimes explosions; the overheating of riveted seams where they overlap, and particularly where they are covered by scale; and hidden defects, due to strains and other causes. Pipe lines, if well protected, will endure many years without material deterioration; but if the wide alternations of temperature, affecting the pipes by contraction and expansion, are not relieved by slip joints, the line is likely to be short-lived, or, at least, to require frequent repairs at stated points. Aerial tramways have greater or less lease of life, depending upon the solidity of the installation and upon the duty they are required to perform. Machine drills, like other machines, have a greatly variable length of life, dependent upon the treatment they receive and the work they do. In some mines machines last much longer than in others, owing to the difference in the hardness of the rock, the pressure under which they operate, and, more than anything else, upon the knowledge and temper of the man who runs it.

On the whole, it may be said that ten years is not too short a time to expect a mining plant to last under constant service and with good care. No account is here taken of the replacing of lighter by heavier machinery, due to the business outgrowing the capacity of the plant. A hoist which will do all that is required at a shaft 700 feet deep, supplying a 20-stamp mill with ore, this being practically the limit of its economic capacity, would be of little service on a 1500-foot shaft where it was required to hoist 1000 tons in twenty-four hours.

THE wisdom and foresight observed in the construction of the Imperial cyanide mill, near Deadwood, South Dakota, is worthy of comment and emulation elsewhere, where dry crushing is in practice, as at the Imperial. The bane of dry-crushing mills is the dust incident to the operation. The annoyance has been reduced to a minimum in the Imperial mill by placing the crushing and pulverizing machinery in a building separated from all other departments, so that the tanks, leaching, precipitation, cleanup, assay and engine departments are free from the objectionable and unhealthy dust.

THE Republic of Mexico is to make operative the law fixing a duty of \$240 per ton (1000 kilos) on dynamite, beginning in October. There are factories operating at Tinaja, which are producing about four tons per day, though said to have a capacity of three times that amount. Two varieties are made, both in the form of sticks. It is said the plant represents an investment of \$3,000,000. The company owns sulphur mines, and manufactures, or intends to make, all the chemicals employed in the manufacture of the explosives.

## Mortar Blocks.

The matter of the proper construction of mortar blocks and the manner of placing and tamping them appears still to be one of personal preference among mill men, although some of the methods employed have nothing to recommend them. If mortar blocks are to be made of concrete only, the best of materials should be used. An inferior concrete, made of poor cement and dirty rock, will not stand the heavy and continuous vibration produced by the dropping stamps. In climates of moderate temperature—that is, where the cold is not so excessive as to cause the frost to disintegrate the concrete—concrete blocks, if well made, have given satisfaction; but for general uses the wooden block is still preferred by many engineers. Of wooden blocks there are several kinds: Those made by a single large piece of timber are solid, and, if the wood be well charged with resinous matter, will not readily decay; but in most regions sticks of timber of the proper size are unobtainable, and often where large enough they are not sufficiently sound to justify their use for mortar blocks.

In some mills the blocks are built of two pieces, as it is much easier to get sticks which will answer for this purpose; but, on the whole, the built-up block, made of 2-inch or 2½-inch selected plank, forms a block which over twenty years of experience has proved to be suited to every condition and probable emergency. The planks are set on end and placed lengthwise of the mortar. The mistake has occasionally been made of setting them transversely of the mortar. By setting them longitudinally, if in the future it becomes necessary to remove the outer planks, which are the only ones likely to suffer decay, the outer two or three layers may be removed and new planks substituted for them. It is always a wise provision to treat the planks to be used with some preservative preparation, which will tend to greatly increase the life of the block. A block of this type of construction may be built up in the pit or it may be built on the surface and lowered into the pit by chain blocks. This is a matter of detail which the builder will settle for himself. If a solid rock foundation is not available, a broad, solid base of concrete is advisable. It should extend at least one foot beyond the block on all sides. The practice of laying heavy timbers on the concrete base in such a manner as to form a mortise to receive a tenon formed on the lower end of the mortar block, has nothing to recommend it. Some New Zealand mills have blocks built in this fashion. The mistake is often made of cutting the pit too small in which the mortar block is set, and in one California mill the pit, already too small, was lined with a concrete wall which comes within 4 inches of the face of the block on all sides, this space being filled with tailings sand, packed tight by turning water into the pit. This renders the making of repairs impossible without first removing the mortar and hoisting the block from the pit after taking out the tamping. There is no loss of stability or rigidity in having the pit of a size which will afford room to work in the space between the walls and the mortar block. This space can be filled with sand, which may be wet down or run in wet. The wet sand packs as tight as rock and is readily removed by shoveling or by means of a hydraulic ejector when repairs are necessary, or if for any reason it is desired to inspect or remove the blocks. Notwithstanding over fifty years of practical experience in mill building, there are still many fallacies in connection with individual ideas of how a mortar block should be built.

THE Japanese government has set aside for the exclusive benefit of the government the area covered by recently discovered gold fields in the province of Iwate. Government engineers who have recently examined that section report that the mines when equipped will become large producers, the estimate of annual output being placed at \$15,000,000.

DURING the present week the American Institute of Mining Engineers is holding its eighty-seventh meeting in the iron and copper region of Lake Superior. This should prove to be one of the most interesting meetings ever held by the institute, as there is much of unusual interest and importance to be observed in that region.

## CONCENTRATES.

WITH 300 feet head there would be, theoretically, 101.38 H. P. developed with 140 miners' inches.

\*\*\*\*\*

A CUBIC FOOT of zinc weighs 437 pounds; of lead, 711 pounds; of mercury, 849 pounds; of gold, 1204 pounds; of platinum, 1342 pounds.

\*\*\*\*\*

A WATER HEAD of 275 feet is equivalent to a pressure of 119.08 pounds per square inch; 0.433 is the pressure per square inch of 1-foot head of water at 62° F.

\*\*\*\*\*

IF the opening in the tank is 18 inches long and 2½ inches high, and the head of water is 24 inches, there would be 133.65 cubic feet of water discharged through the opening per minute.

\*\*\*\*\*

PIPE COVERING and other magnesium fire-proof materials have been manufactured from dolomite in Pennsylvania. The manufactured magnesium carbonate was chemically similar to magnesite.

\*\*\*\*\*

NEITHER copper, manganese or aluminum are magnetic, and yet an alloy of these becomes magnetic. Copper and aluminum alloy is not magnetic, but the addition of manganese gives the magnetic property.

\*\*\*\*\*

COPPER MATTE may be made in a reverberatory furnace as well as in a blast furnace. Some ores can be treated more successfully in a reverberatory than in a stack furnace. Particularly is this the case with ores containing a large amount of fines.

\*\*\*\*\*

A NORMAL fault is one where the hanging wall side of the fault plane has moved downward relatively to the foot wall. A reverse fault, or thrust, is one in which the movement has been, as the name indicates, in a reverse direction—the hanging wall has moved upward.

\*\*\*\*\*

LANDS known to be mineral are exempted from the operation of school land grants. A broad meaning is attached to the word "mineral." All mineral substances which have a value in the markets, whether metals or earthy minerals, are "mineral" in a legal sense.

\*\*\*\*\*

A COMPASS NEEDLE points north and south, because in that position the metal of the compass is parallel to and is carrying more of the lines of the earth's magnetism through it than at any other position. The needle always points in the direction of the magnetic pole unless locally influenced.

\*\*\*\*\*

THE accepted unit of rating of boiler horse power in the United States is that recommended by the American Society of Mechanical Engineers, viz.: One boiler horse power is equivalent to the evaporation of 34.5 pounds of water per hour from a feed-water temperature of 210° F. to dry steam of the same temperature.

\*\*\*\*\*

IN shafts of good size it is advisable to put in ladders, which are inclined, extending the length of two or three sets, providing a platform at the lower end of each section, the ladder beneath being inclined in the opposite direction. This avoids accidents and makes it safely possible for men to climb out of mines from great depth in case of necessity.

\*\*\*\*\*

IN surveying mining claims for patent it is very important that the bearings and distances from certain corners to United States mineral monuments, or to the established corners of the public land survey, be made with great care. This will obviate future expensive complications involving the position of the claim and is as important as establishing the lines of the claim itself.

\*\*\*\*\*

WHERE the dip of a vein departs less than 60° from the horizontal, and the walls of the vein are heavy, it is good practice to sink the shaft in the footwall at a distance from the vein sufficient to avoid the heavy ground. By this means the alignment and angle of the shaft may be kept straight. Where shafts are sunk on the vein in heavy ground they are likely to have trouble with shifting ground.

\*\*\*\*\*

THE temperature of carbon monoxide burning in air is estimated at 1400° C. The combustion of carbon monoxide (CO) produces carbon dioxide (CO₂) which is not inflammable, but on the other hand quenches fire as effectually as water. CO₂ is the choke damp of the coal miners. It is found in metal mines as well. Fire damp (also called methane or marsh gas) is light carburetted hydrogen. It is a highly explosive gas, and in some districts flows from driven wells or is collected in swamps, and is employed for heating and lighting.

\*\*\*\*\*

THE locator of a water right must post a notice at the point of diverting the water. This notice must state the quantity of water appropriated and the purpose for which it is taken, and actual work must be begun on the dam and ditch or canal within a specified time, in most of the mining States sixty days, and the work prosecuted with "due diligence," which has been interpreted to mean "reasonable diligence," that is, not in a

desultory manner and at times long apart, but that work be prosecuted continuously, or nearly so, the object being to show the "good faith" of the locator, who is judged by his acts and not by his intentions.

\*\*\*\*\*

MICA is found in a great many crystalline rocks, usually as an essential constituent of such rocks, such as granite and mica schist, but commercial mica is only found in dikes of intrusive coarse grained granite (pegmatite). Mica plates 2 inches square and over are merchantable if of good quality. There is no text book devoted to mica alone. Descriptions of the various kinds of mica are found in all mineralogical text books. The United States Geological Survey annually issues statistical and other information concerning mica and other minerals in the form of bulletins. These may be had upon application to the Director of the Survey at Washington, D. C.

\*\*\*\*\*

THE Davy safety lamp used in mines where there is fire damp is an application of the principle that a flame is extinguished by contact with a large surface of a good conductor of heat, such as iron or copper. This principle can be demonstrated by the simple experiment of forming a thin, soft copper wire into a coil like a spring by winding around a pencil, and lowering this coil about the flame of a candle, it will at once extinguish the flame, owing to the rapid lowering of temperature by heating of the wire. If the wire be first heated before placing over the candle flame it will not extinguish the light, because the lowering of temperature does not take place so rapidly. In the safety lamp the flame is surrounded by an iron wire gauze having 700 to 800 holes to the square inch.

\*\*\*\*\*

THE application of zinc dust or "zinc fume" to the precipitation of gold from cyanide solutions is limited. It is claimed by most operators that the zinc thread or shavings possess an advantage over the dust, in that by the former the precipitation is continuous and uninterrupted, whereas, in the latter precipitation, it is only effective at the time of adding the zinc fume. Wooden (redwood) tanks may be safely used in dry climates where the tanks are to be shoveled out. Tanks are made suited to these conditions, having a deep groove or channel cut in the top of the staves, and forming a connected ring extending entirely around the top of the tank. The groove is kept full of water, and this reduces the shrinkage to a minimum. The hoops should be of round iron and not flat, as with the latter the friction due to binding is so great that the staves cannot be drawn together upon shrinkage. It is also advisable to have at least three lugs on each hoop instead of one. This permits tightening the staves equally on all sides.

\*\*\*\*\*

THE potassium cyanide method of determining the copper contents of an ore or matte depends upon the conversion of the blue color of the copper solution (produced by addition of ammonia in excess to the green nitrate solution) into a colorless solution. It is essentially the measurement of the amount of potassium cyanide solution necessary to decolorize the ammoniacal solution of copper nitrate or sulphate. The reactions taking place are complex. In this method of assaying an increase of temperature increases the intensity of the blue color; a large excess of ammonia has a tendency to vary the color and to give low results; ammonium sulphate gives low results; the presence of hydroxides, bicarbonates, sulphites and nitrites affects the result; salts of silver, zinc, nickel, etc., which will react with potassium cyanide if present must be estimated; ferric or manganese hydroxides should not be present, as they hold copper and affect the final titration.

\*\*\*\*\*

WHERE there is heavy side pressure in a stope in which the square set method of timbering is employed the caps should be framed in such a manner that their ends meet on top of the post. These caps should have no "give" at all and be wedged tightly to the walls or sides of the stope, the endeavor being to prevent the ground from starting. If it begins to "come" it is more difficult, dangerous and expensive to support it. With heavy down pressure the timbers must be so framed that the posts meet, the caps and ties resting on shoulders cut in the posts. Where both side and downward pressure are exerted, either style of framing will do, but it may be necessary to put in the supplementary "angle braces," placed in the direction of the greatest compressive force, generally from hanging to foot in a direction nearly at right angles to the hanging wall. Unfortunately the pressure will generally shift from one place to another, or from one direction to another as stopping progresses, and for this reason the filling of large stopes contemporaneously with the extraction of ore is imperative.

\*\*\*\*\*

THE amount of water required in milling and concentration of ores depends upon the character of the ore and upon the methods employed. In amalgamation in the battery the amount of water for the best work is reduced to the minimum which will keep the screens from clogging. Careless and inexperienced millmen sometimes shut off the water to such an extent that the crushed pulp accumulates till half the screen is covered, but this is not advisable under any circumstances. If water be so scarce as to afford too small an amount, hang up part of the mill; or, if but one mortar, slow the drop, thus reducing capacity. The mistake is sometimes made of attempting to run the con-

centrators with insufficient water. Again, it is better to hang up a portion of the mill and do good work with that portion which is run. In concentrating mills where no amalgamation is practiced the amount of water varies from 3000 to 5000 gallons per ton of ore crushed. The loss from seepage, evaporation and from other causes, where mill water is settled, pumped back and re-used, is from 25% to 50%.

\*\*\*\*\*

THERE are various devices for agitating pulp in the cyanide process. In some instances compressed air is employed for this purpose, and has been found to be an efficient agent for this purpose. When compressed air is used, it has been found that it is not necessary to continuously agitate the solution, but to turn on the air for fifteen or twenty minutes, then shut it off for half an hour or more, then turning it on again and renewing the agitation. Other devices for agitating are revolving barrels with and without diaphragms, and the ordinary muller of the silver mill pan. This latter works well when set in motion and the pulp is introduced by means of a pipe; but should a moment's stoppage become necessary, the pulp quickly settles to an extent that greatly interferes with the renewal of agitation, and with sulphides it is impossible to start up if the agitator is buried even partly. A device which has been successfully used for the agitation of sulphides in cyanide tanks is a screw propeller having two blades. This is keyed to a vertical shaft secured to timbers and set directly over the center of the tank. The shaft is suspended by a collar keyed near the upper end, and held in position by passing through a box bolted to a timber about the middle of the shaft. This lower box acts like the lower guide of a stamp stem. A pulley is fixed to the shaft either at its upper end, or between the upper and lower guides, and the agitator revolved by means of a driving belt, or it may be actuated by means of a gear, though the former is preferable. The propeller is fixed just above the surface of the pulp—siliceous sands or sulphides—whatever it may be, and is submerged by the solution. When the propeller is revolved it quickly causes the pulp to be taken up and held suspended in the solution. It has been found that the rotary motion thus imparted to the pulp has a tendency to cause it to bank up around the inside periphery of the tank. This has been obviated by placing a plank on edge beneath the propeller, and extending entirely across the tank. The result is a perfect agitation and no large accumulation of pulp at any one place. In the case of sulphide treatment, the pulp being very heavy settles and packs hard almost immediately upon the stopping of the screw, but upon restarting it the pulp is again quickly taken into suspension. As in the case of agitation by air, the continuous revolution of the screw is not deemed necessary. The power required is small, and the cost of equipment not excessive. It may be run at any number of revolutions found to accomplish the desired result.

\*\*\*\*\*

OF the metallic elements which occur native, the most widely distributed are gold, silver and copper. With the exception of iridosmine (IrOs) and one form of palladium, the native metals crystallize in the isometric system—gold and copper commonly showing "repeated twinning" (parallel repetition or grouping of successive crystals). Gold is seldom found in sharply outlined crystals, when freed from its matrix or vein; because of its softness the edges and angles become more or less rounded. To find a native metal absolutely pure is rare, as all are more or less alloyed with other metals—e. g. gold usually contains silver; silver usually has copper or sometimes platinum, antimony, bismuth or mercury; copper often has silver; platinum is usually alloyed with iron, iridium and osmium. Native mercury (quicksilver) is comparatively rare, but when found is usually associated with cinnabar. There is also a native amalgam containing silver and mercury in varying proportions, its occurrence having been noted at certain mines in Germany, Norway, Sweden, Almaden in Spain, Chile and British Columbia. Lead, native, is of rare occurrence. Besides in Sweden and the Ural mountains, Russia, it has been found at Breckenridge and Gunnison, Colorado, and Hailey, Idaho. But one authentic occurrence of native tin is known—near Oban, New South Wales. Copper and iron are found in the largest individual masses—copper, up to 500 tons, in Keweenaw and Ontonagon counties, Mich.; iron, in basalt, at Blaafjeld, West Greenland, and in meteorites. Meteoric iron is always alloyed with nickel. Copper, while occurring native in small quantities in most of the principal copper-producing districts, is mined almost exclusively in that condition in but one locality—Lake Superior district, Mich. It is also mined, native, in considerable quantities in Bolivia. The Lake Superior copper contains a percentage of silver. Zinc, so far as known, does not occur native. The semi-metals, arsenic, antimony and bismuth, are found native in limited quantities and usually associated with each other. The crystallization is rhombohedral. Of the non-metals the principal native occurrences are of carbon (diamond and graphite) and sulphur. The diamond crystallizes in the isometric system, and with the principal exception of South Africa, its source is largely in alluvial deposits. Graphite has a rhombohedral crystallization and occurs in beds and imbedded masses, laminae and scales. Sulphur is orthorhombic and is found at hot springs, in solfatara, and in volcanic vents, also in beds of gypsum. Selen-sulphur is a native compound of selenium and sulphur. Tellurium has been found native in Transylvania and Colorado.

## The Mother Lode in Tuolumne County, California.

Written for the MINING AND SCIENTIFIC PRESS by W. H. STORMS.

Throughout the entire length of that portion of the gold belt occurring in Tuolumne county, and known as the Mother Lode, there are definite and striking geological and mineralogical characteristics which distinguish it. The lode does not outcrop continuously through Tuolumne county, but the aggregate of the several disconnected outcrops will cover a distance of several miles. The striking features of the lode in this section are large masses of snow-white quartz, standing often several feet above the surface, and in some instances forming prominent hills, as at Quartz mountain, at the Golden Rule hill near Stent, and less prominently Whiskey hill near Jamestown. In some instances these outcrops look like huge white walls, as on the Eagle-Shawmut mine near Jacksonville. These quartz masses are always found accompanied by broad zones of rock consisting of the carbonates of lime and magnesia and sometimes of iron. In the absence of the iron carbonate the rock is essentially dolomite, but with the addition of the iron carbonate the rock becomes ankerite. This dolomitic rock is also a characteristic of the Mother Lode in Mariposa county, and in the southern part of Calaveras county. It is usually found in Tuolumne to be ankerite rather than dolomite, and the decomposition of the iron carbonate, aided to a certain extent by the oxidation of the pyrite occurring in the normal rock, has resulted in the formation of great masses of hematite and limonite, which resemble the iron gossan of some cop-

Cross Section of Table Mountain, Tuolumne County, Cal.

per lodes. This ankerite is usually accompanied by the green chrome mica mariposite, and it was doubtless the occurrence of this bright green mineral with the iron oxide that led early prospectors to explore some of these outcrops for copper.

The wall rocks of the lode vary somewhat from one point to another along its length, but generally speaking they are amphibolite schist, and serpentine, with occasionally black clay slate, diorite, diabase, and feldspathic dyke rocks of granitic type—these latter in the southern end of the county. The ankerite is usually found seamed with quartz veins, great and small, forming a sort of "stock works." The rock usually carries some gold, and in at least one mine, the Rawhide, it was found rich in coarse gold. In the northern end of the county there has been considerable work done of an exploratory character on this zone, but these mines have thus far not proven to be rich. Large masses of gold-bearing rock have been developed which is relatively low grade, though in character what is known as free milling, which in California means that a high percentage of value can be saved by plate amalgamation and concentration of the sulphides. In this vicinity, near Tuttletown, is Jackass hill, one of the most noted pocket mining sections in California. The rocks of this eminence are chiefly amphibolite schist, and the gold occurs for most part at the intersection of seams and small veins. The distribution of the gold has been very erratic, and ranges from a few "colors" to accumulations worth many hundreds of dollars. In the aggregate the pocket mines of Jackass hill and vicinity have produced several hundred thousand dollars, and new discoveries continue to be made frequently. The "pocket" zone lies a few hundred feet east of the Mother Lode, in the schists forming the hanging-wall country. Along the main lode pockets and disseminated gold are found, but between the Stanislaus river and the Rawhide property no largely profitable mine has as yet been developed, though there are several shafts 500 to 1000 feet deep with extensive lateral development. Some of the surface installations were unnecessarily elaborate and premature, but although exploration of this section of the lode has been somewhat disappointing, there are long reaches of the lode wholly unprospected, except in the most superficial manner. There are numerous indications of profitable possibilities in the schists and slates of the hanging wall country, which is found in places seamed with quartz stringers, and these have scarcely been prospected, to say nothing of being developed. The Alameda mine is one of those which have been developed to considerable extent, but although there was a promising ore shoot at the surface in the form of a gold-bearing quartz vein in the ankerite mass it proved unprofitable to the depth reached by the shafts—about 1000 feet—though in other mines of the lode rich ore is found far below the 1000-foot mark. The most profitable mine on this

part of the Mother Lode has been the Rawhide (see accompanying illustration). The outcrop of this mine consists of large masses of white quartz accompanying the ankerite. Physically and geologically, it is not unlike the other mines on the lode in the vicinity. There was a pay shoot on the Rawhide, however, at the surface, and though this surface shoot was exhausted at comparatively shallow depth, other shoots were found below. The mineral zone of the Rawhide mine is from 50 to 150 feet wide. Within it occur numerous large quartz masses, carrying auriferous pyrite. The amphibolite schist also con-

would be anticipated. South of Rawhide No. 2 is the noted Table mountain—an ancient river channel capped with black basalt. Table mountain has for fifty years served in geological text books as the type of lava-covered ancient channels in California. The sketch of its cross section has become familiar to all students of geology. The channel is gold bearing throughout its entire length as far as explored, and where it has been possible to drain it, it has generally been worked profitably. The gold in the upper end of the channel, which takes its rise, as it were, in Calaveras county, derived its gold from the

The Rawhide Mine, near Jamestown, Tuolumne County, Cal.

tains gold-bearing sulphides, as well as the ankerite. It was in the Rawhide mine that the rich gold-bearing ankerite, almost destitute of quartz, was discovered in 1893. This occurrence may be called the anomaly of the lode, for although, as previously stated, the ankerite is usually auriferous, it has nowhere else along the entire length of the lode, in a distance of 120 miles, been found as rich as this single shoot of the Rawhide. At the Rawhide the wall rocks are variously black slate, amphibolite schist, diorite and serpentine. The serpentine, which at

numerous veins of the east lode. The channel was still further enriched by passing through the "pocket country" lying between the East Lode and the Mother Lode, and the latter undoubtedly contributed still further to the golden stream. The lode passes beneath Table mountain almost at right angles to the channel, in what is known as the Omega claim. This property is about to be developed by sinking a vertical shaft 500 feet near the base of the northern slope of the mountain, on the Rawhide side. From this shaft drifts will be run

Open Cut of the Alabama Mine, Near Jamestown, Tuolumne County, Cal.

the south end of the property lies on the hanging wall side of the lode, near the north end swings westward and crosses the course of the vein, forming the foot wall for a short distance. The fissure continues straight through the serpentine, however, not an unusual occurrence on the lode, where it is often seen that the fissure maintains its direction regardless of changing course and character of wall rocks.

The section adjoining the Rawhide on the south, Rawhide No. 2, is developed to only a limited extent, having a shallow shaft sunk on a shoot of quartz carrying gold and tetrahedrite (gray copper). The occurrence of this mineral in the mines of the lode is usually considered by the miners a good indication of payable values, though experience has shown that it is not an infallible index of such condition. The property referred to lies in flat meadow-like ground and requires hoisting machinery. The Rawhide mine, although lying in a basin-like valley, makes a surprisingly small amount of water—much less than

along the vein to explore for pay shoots. This proposition is one of those, owing to physical conditions, wherein the outcome is purely speculative, yet the owners feel sufficiently sanguine of success to equip the mine with the necessary machinery and to furnish means to do the work of development. It is also the intention to work the gravel of the ancient river by running a drift from the shaft at a level which will drain the channel, the water to be raised about 100 feet to a tunnel level through which it will drain.

South of the Omega is the Alabama mine, which has been developed extensively, but has been idle for some years. It was at one time equipped with a 20-stamp mill and produced considerable gold. One of the accompanying illustrations is that of an open cut on the Alabama mine. It shows the structure of the vein and its relation to the auriferous slates and schists of the hanging wall. The ankerite mass is a prominent feature of the Alabama mine.

## The Mining Industry of Nevada.

Nevada, the Silver State, has always been noted for the enterprising character of her citizens, and the recent publication under the auspices of the Nevada Chamber of Commerce of a handsome pamphlet for gratuitous distribution and entitled "Greater Nevada," shows that the same enterprise and energy is still found in that State. Among other features of interest in this book, descriptive of the various resources and industries of Nevada, that referring to the mining industry, written by W. T. Moran of Virginia City, is one of the most interesting. In a few brief paragraphs is given an epitome of the industry as it exists to-day in that State. Although known as the Silver State, the output of gold now far exceeds that of silver. The author of the contribution above mentioned writes as follows:

It being impossible within a brief space to give an exhaustive description of the mining industry of Nevada, the writer must content himself with making a few statements regarding the mining in the past and present within the State, and offering a few facts to prove the statement which has often been made, viz., that the mining and prospecting already done has merely been scratching. When a map of Nevada is examined, it will be noticed that the topography consists of not less than sixty distinct ranges of mountains, all of which have been named, besides many other lesser chains and isolated peaks, divided from one another by valleys more or less fertile. These ranges vary from 10 to 50 miles in length, and gold and silver are found on every one of them. The mountain ranges run nearly north and south, but in some cases the mineral belts run east and west; one in particular, in Elko county, extending east and west, is nearly 40 miles wide and 1-0 miles in length; gold in placers and ledges has been found in paying quantities throughout its entire length. The area of Nevada is 71,000,000 acres, mostly mountainous. Every day new discoveries are being made. No one ever heard of Tonopah until late in 1900, nor of Goldfields until two years later. It is therefore reasonable to suppose that many more equally rich and productive districts will be discovered from time to time when the ubiquitous prospector reaches them. It is not to be supposed that no prospecting has been done along these ranges; they have all been more or less traversed by eager seekers after gold and silver, but various causes led to many promising ledges and placers being abandoned for the time being; among these causes may be mentioned inaccessibility, scarcity of water, lack of transporting facilities, lack of funds, etc.

**CHURCHILL COUNTY.**—The gold discoveries in this county are rich, and several extensive copper mines are turning out and shipping matte. In the eastern part of the county are several high ranges of mountains, notably Carson Sink, Augusta and Sinkavata mountains. These mountains, like all others in Nevada, are seamed with ledges, carrying gold and other metals. Many rich veins of gold and silver have been discovered and have produced a large amount of bullion. Most of the discoveries are of recent date and give good promise for the future.

**DOUGLAS COUNTY.**—Is generally mountainous, with rugged high peaks. The Pine Nut mountains in the eastern part of the county are seamed with ledges of quartz, rich with precious metals. There are also rich placer mines, which have been worked profitably in a small way, the scarcity of water preventing more extensive operations. In the southern part gold mines have been worked for many years profitably.

**ELKO COUNTY.**—This county contains 10,972,000 acres of land, or over one-seventh of the entire State of Nevada. Its length is 155 miles and width 129 miles. It is not considered a leading mining county, but the net proceeds of its mines hold a respectable relation to the net proceeds of the mines of the State. The mountains cover one-half the area of the county, and are from 8000 to 12,000 feet high. These mountains are rich in minerals, but were never thoroughly prospected. Tuscarora, the leading mining camp of the county, was one of the first discovered, and has been worked continuously since. The placer mines there discovered are also being worked. Afterwards silver ledges were developed and have turned out \$10,000,000 worth of silver. The gold ledges in the district have been recently opened up and are now being profitably worked.

**ESMERALDA COUNTY.**—The mines of Esmeralda principally produced silver; but since the decline in the value of that metal, gold production has received more attention, and many rich ledges have been opened. The principal districts in this county are Aurora, Pine Grove, Hawthorne, Palmetto, Silver Peak, Candelaria, Silver Star, Tule Canyon, Montezuma and Cambridge. These camps have produced not less than \$20,000,000. In the county is also situated the new camp of Goldfields and a part of the camp of Tonopah. A few words about the Goldfields district will not be out of place here. Scarcely two years old, it has developed into a very promising camp, and bids fair to rival its sister camp, Tonopah,

from which it is distant 26 miles. The principal mines are the Jumbo, surface average \$275 per ton, at 50 feet average \$1467, Combination (ore goes \$200 to \$400 in gold), and January and Florence.

**EUREKA COUNTY.**—Eureka district was discovered in 1864. This district ranks second only to the Comstock in Storey county. The mines have produced \$125,000,000, and only a few ledges known to exist in this district have been worked and very little deep mining has been done. In this camp, as in many others, the cyanide process of treating ore and tailings has caused a great revival and worked a wonderful transformation. Lead is largely produced from the mines of Eureka district. Iron is found in abundance, and near Palisade, in the northern part of the county, is a large deposit of magnetic iron ore now being worked. The mining camps are Eureka, Cortez, Mineral Hill and Safford.

**LANDER COUNTY.**—Silver and gold were first discovered in 1862, and since then mining has been the principal industry of the county. The most important mining districts of this county are Austin, Galena, Lewis, Bullion, Pittsburg, Kingston, Marysville, New Pass and Yankee Blade. Good prospects have been found in every mountain range in the county, and throughout the county are many rich undeveloped prospects of gold and silver. About 12 miles southward from Austin, in the Toiyabe mountains, are the Big Creek antimony mines, which, with similar ones in Humboldt and Churchill counties, enjoy the distinction of being the richest mines of this metal in the world. The ledge is very wide and about 2 miles of its length has been traced. Lander county has produced over \$36,000,000 in precious metals.

**LINCOLN COUNTY.**—Contains 19,000 square miles, or 12,250,000 acres. It was organized in 1866, and has produced \$30,000,000 in gold, silver, lead and copper. And much more remains to be extracted, as in fact mountains of mineral lie practically untouched in this county. Other metals besides gold, silver, copper and lead exist in large quantities in this county. In the Raymond & Ely mine alone over \$5,000,000 worth of zinc is said to exist, which could be extracted with profit were transportation cheap.

**LYON COUNTY.**—In this county is situated Silver City, one of the richest mining districts in Nevada. Many millions in gold and silver have been taken out, and at present all or nearly all the mining claims are being worked with more or less profit. Here, too, cyaniding has worked wonders, and is being carried on on a large scale. The mines in this district carry a large proportion of gold. The great drawback to mining in this district is the presence of water within 100 feet of the surface preventing deep mining. This obstacle will be removed when the system of drainage contemplated and now being constructed is completed. In the central and southern parts of this county promising gold and silver quartz ledges have been found, notably at Como. In the eastern part many copper mines are being worked at a profit.

**NYE COUNTY.**—Many rich mines of gold and silver have been discovered in this county and have yielded an enormous amount of bullion, but as in other portions of the State cheap transportation facilities are almost absent and retard the development of the county. When more railroads come all this will be changed, and it will be profitable to work low-grade ores. A railroad has been built from Sodaville to Tonopah, which will give cheaper transportation and open up a vast territory containing many rich mining camps.

Four years ago, in 1900, James Butler discovered Tonopah, and at present writing there are over 4000 people in the camp. From its discovery up to the last day of December, 1901, \$4,500,000 was produced. The mineral zone is 7000 feet long by 5000 feet wide. Besides gold and silver, copper, lead, antimony, zinc and quicksilver have been found in quantity in this county; also gypsum, fireclay, chalk, soapstone, borax and alum.

**ORMSBY COUNTY.**—There is little or no mining being carried on in this county, but many of the wealthy mine owners of the State have their residences in Carson, the capital, which is a beautiful and attractive city.

**STOREY COUNTY.**—This is essentially a mining county, and has produced the greater part of the gold and silver that has been taken out of the State. No group of mines in the world have taken out more. The amount is \$600,000,000. It is the only place in the State where deep mining has been carried on to any extent. The workings are down 3300 feet, and some of the most expensive pumping and hoisting machinery in the world are in operation in the mines of the Comstock. These mines are as modern and up to date in their equipment and operations as any in the world, and the use of electricity for airing and lighting the mines is almost universal. Electricity is also used for hoisting in some of the mines, and for pumping in the C. & C. shaft of the Con. California & Virginia mine. The entire mine is lighted by electricity, 250 sixteen candle power lamps being used in the drifts, stopes and crosscuts and stations. Electricity is also used to compress air to drive the drills and to run the fans used in keeping the mine cool. Previous to the introduction of electricity into the

camp the cost per horse power was \$20; this has been reduced to \$7 per month.

**WASHOE COUNTY.**—The leading industries of this county are agriculture and manufacturing, but recently discoveries have been made of rich mineral deposits, notably at the Wedekind mine, near Reno, where in apparently unproductive rock values as high as \$700 per ton have been found, and extensive bodies of very rich rock have been blocked out in the various mines on the Wedekind lode. Gold and silver have been universally mined in various other parts of this county, which contains also rich veins of copper, iron, sulphur and borax; salt and soda are to be found in large deposits north of Pyramid lake. There are mines of quicksilver also in this county.

**WHITE PINE COUNTY.**—Some of the richest silver mines in the State exist in this county, and were universally and profitably worked up to the time when silver declined in value. Lately many rich discoveries of gold have been made and new ones are being constantly found. The principal mining districts are Hamilton, Ely, Eberhardt, Treasure City, Mineral City and Osceola. At Osceola extensive placer mines are being worked by hydraulic process, and annually yield a large amount of gold.

**SUMMARY.**—Nevada is one of the richest States. It is no longer a silver State only. Employment can be found for more men in mining for gold than silver mining afforded in the past, and a greater amount of wealth can be returned every year. The Comstock ore is about 45% gold. Eureka ore carries about 30% gold. Lincoln county ore is mostly gold. Esmeralda ore, except at Candelaria, is all gold. Silver Peak has a gold ledge 45 feet wide and miles in length. Pine Grove ledge in Esmeralda has produced \$2,000,000 in gold, it is 200 feet wide and traceable for miles, and is practically untouched. Hawthorne is also a gold-bearing district.

## The Father Lode Extended.

TO THE EDITOR:—I have read with interest the article entitled "The Father Lode of California," in the issue of Aug. 27, and wish to make a slight addition thereto. The author of that article seems to consider that the belt of mineralized country described ends at, or near, Minnesota or Alleghany, Sierra county. While my acquaintance with the locality is somewhat limited, I think that the belt may safely be considered to extend at least 10 miles farther to the north. The contact between serpentine and slates crosses the north fork of the Yuba river at a point only a little below Downieville (noted in early days for its exceptionally rich placers), and at several places between Downieville and Fir Cap mountain it may be recognized. The hills here are nearly all covered by lava flows, so that the contact cannot be followed from one point to another.

A mine on the south side of Fir Cap mountain has undoubtedly opened one of the veins of this belt. It was accidentally found by drift miners while tunneling for gravel. The apex of the vein being probably 600 feet under the surface of the mountain, the tunnel would have passed over it had it been driven a few feet higher. The foot wall is serpentine and the hanging slate. The vein itself is more a zone of fissured rock and "talc," containing small quartz veinlets and mineralized by arsenopyrite, than a true vein. It is very little developed as yet, and its value below the zone of oxidation problematical, but near the apex (the, at one time, surface) free gold is found in crystals, and the arsenopyrite shows indications of secondary concentration.

Another mine, on the opposite side of the Yuba, near Mountain House, is on the same contact, and shows the same characteristics as the one on the north. Standing at Mountain House one looks down an almost straight valley to the Yuba river, and up another equally straight valley to the mine on Fir Cap mountain. When this region has been more fully developed it will probably be found that the contact has here been an easily eroded area, and has resulted in the present valleys. At the point where the axis of the two valleys cross the Yuba river is found the old and famous placer camp, Goodyear's Bar.

As I said at the beginning, my conclusions are the result of only a few days' observation while in that part of the country some time ago, and may be entirely at fault. However, it seems as if this district must be included within "The Father Lode."

I agree with your correspondent, that this district can be looked to with advantage. It seems as if this particular district had stood still since the days of '49, and is now ripe for development at the hands of Capital and Transportation. L. W. TRUMBULL.

Laramie, Wyo., Sept. 5.

## California Mineral Output.

Statistical tables issued by the State Mineralogist of California, showing production of all minerals produced in California for seventeen years from 1887 to 1903, inclusive, and also the production by counties for 1903, have been received. The total output for 1903 was \$37,759,040, against \$35,069,105 for 1902. The total output for seventeen years is stated to have been \$418,851,833.

## Milling of Auriferous Ores in New Zealand.\*

Written by H. A. GORDON.

In dealing with the pulverization and treatment of auriferous ores, it may be stated that there is not one system of treatment applicable to all classes. In the southern portion of New Zealand the ores generally contain free gold, with scarcely any impurity—that is, it is found in an almost pure state, without alloy, and its dissemination among the matrix is generally in coarse particles. The only difficulties the millman has to contend with are the economical concentration of pyrite, which in some of the lodes is rich in gold, and the extraction of the gold the pyrite contains. In some of the lodes there is what may be termed float gold—that is, the particles of the precious metals are so finely divided that they pass over the quicksilver tables—and, unless there are some other appliances for saving them, this class of gold is lost. It is only within the past few years that any attention has been given in the southern portion of the colony to saving the fine gold that has passed the amalgamating tables.

In the North Island the ores are very complex; there are scarcely two mines, although they may be adjoining each other, where the bullion is of the same character. On every field the gold is alloyed with silver, and in combination with other metals and mineral substances, such as copper, zinc, antimony, galena, iron, sulphur, arsenic, etc., and in some instances cinnabar, as in the case of the Champion lode at Tui creek, Te Aroha. Ores of this class are extremely difficult to treat satisfactorily. Shipments of ore from the lode referred to have been sent to the smelting works at Swansea, also to Freiberg, and at both these works only a comparatively small percentage of the assay value of the ore was obtained. With ores of this character the difficulties the millman has to contend with are very great, and have led to many experiments being made in the treatment of auriferous ores in the North Island. Ten years ago milling and treatment of ores was carried on by rule-of-thumb; no assays were made to ascertain the value of the ore, and every one in charge of milling operations would confidently assert that he was saving 80% of the gold, where in reality the extraction would not exceed 50%. So long as mines could be made to pay for working, and in some instances so long as calls could be got from shareholders, this system of treatment was carried on, always hoping against hope that a rich bonanza of ore would be struck to recoup them for the outlay.

The values of the bullion on North island fields differ considerably. On Coromandel the maximum value of bullion does not exceed \$15.30 per ounce; on the Thames the average value is about \$12 60, and in the Ohinemuri field the value is in some instances below \$6 per ounce. The gold is in extremely finely divided particles, disseminated through the matrix; in many instances no fine gold can be seen in ore having value of \$50 per ton. The value of the ore can only be obtained by careful sampling and assay.

**MILLING.**—For several years there was a controversy among millmen in the northern goldfields as to whether dry crushing would not be the more advantageous system to secure a higher percentage of the bullion in the ore. The Waihi G. M. Co. at Waihi was the first to erect a 60-stamp mill for dry crushing. This was previous to, or nearly at, the same time as the introduction of the MacArthur-Forrest cyanide treatment. When this mill was erected the bullion was saved by amalgamation. The pulverized ore was collected in a chute with a spiral conveyor, collected along each battery of thirty stamps, in front of the screens, so that the dust forced through the screens was conveyed into a chamber from which a set of bucket elevators lifted it into bins, and from the latter it was conveyed by trucks to combination amalgamating pans. These pans were 5 feet in diameter and about 2 feet 6 inches in depth. Each pan contained from 200 to 250 pounds of quicksilver. They were worked in charges of about 18 to 20 hundred-weight of the pulverized ore. These charges took about four hours. The first two hours the ore was ground with quicksilver, with a sufficient quantity of water to make it into a moderately thick pulp. This was heated with steam to a temperature of about 120°, a little salt and sulphate of copper being added to each charge. After grinding the ore for about two hours, the miller was lifted and kept revolving for an additional two hours with more water, after which the charge was run into a settler and worked in it for such a length of time as to collect the small particles of globules of quicksilver. With this system of treatment about 68% of the gold was saved, and about 45% of the silver.

Other mills were erected to also crush the ore dry; but it was found a much more expensive system of treating the ore than by wet crushing. Moreover, the dust about a dry crushing stamp mill proved very injurious to the workmen, besides wearing away the bearings of the working parts considerably, and, as the cyanide treatment became generally understood, wet crushing was again resorted to. Improvements will continue to be made in the system of economically treating auriferous and argentiferous ores, whereby the expense of treatment will be reduced and a larger percentage of the bullion extracted.

To collect the dust floating about the dry crushing mills, ventilators and exhaust fans were used to draw it into bins near the roof of the building; but even with these appliances dust still keeps floating about the mill. It was almost impossible to get a clean, clear atmosphere inside the building, although the fans and ventilators removed a large quantity of dust from the stamps. The lifting of the pulverized dry ore into bins, drawing it off, and depositing it in the vats always raised the fine minute particles, which presented a slight misty appearance in the building.

In regard to the best and most economical method of reducing auriferous ores to a finely pulverized condition, some millmen prefer one machine and some another; but the consensus of opinion here is in favor of a stamp mill, having either a Gates or Blake-Marsden crusher, to reduce the ore to about 1½ inches in diameter before depositing it in the ore bin for supplying the stamps. Other mills have been tried in this colony, but stamps have generally replaced them. The Huntington mills are also in use, crushing through 40 to 60-mesh screens. One or two of these mills were erected at the Kauri Freehold Co.'s plant at Opitonui to grind the coarse sands from the spitzkasten before subjecting them to cyanide treatment.

Cornish, Cyclone and Krom rolls have been tried, but the great objection to rolls of this description is that the rolls wear more at the center than at the ends, and thereby their efficiency is destroyed. The pounding of ore by stamps in a mortar produces far more slimes than the same ore would do if crushed by rolls.

For dry crushing the tube mill is an efficient machine; it will pulverize from 16 to 18 tons per day of average hard ore. As soon as the crushed particles are fine enough they pass through the screen during the revolution of the mill, and the sands for treatment are more evenly granulated.

At the time when the MacArthur-Forrest Co. introduced the cyanide treatment into this colony that company sent out a crushing mill to pulverize the ore for cyanide treatment; but, although it was a good grinding machine, the wear and tear was great. It was a machine not suitable for hard ore, nor for wet crushing. All the ore had to be dried before being put through the mill.

In constructing a stamp mill the great desideratum is to have good foundations. If a good rock bottom is not obtainable, a rectangular trench is sunk until firm material is met, after which a bed of concrete is made about 2 feet thick, of four parts gravel and clean, sharp sand to one part Portland cement. On the top of the concrete bed two longitudinal pieces of wood, about 10 inches by 12 inches, are laid, about 1 foot apart, having filling blocks at ends and in the space between the batteries. The open spaces left form mortise holes for tenons on the lower end of the mortar blocks.

Where the mortar blocks can be got having the necessary cross-section, about 5 feet 2 inches by 2 feet 4 inches, all in one piece, they are used. Solid blocks of these dimensions can be procured, especially in the North Island, of kauri timber. The mortar blocks for the Moantairi mill at the Thames have this cross-section, and are 18 feet in length. Concrete walls are built on each side of the trench above mentioned to take the ends of the cross-sills at each end of the mortar blocks into which the battery frames are tenoned. Where the blocks are not obtained in one piece, upright planks or balks of timber are bolted together. The top of the blocks is made level, and a rubber sheet, ¼ inch in thickness, is laid on the top below the mortar box. The mortar box is held to the upright block with strong holding-down bolts in the usual manner.

The battery posts or frames are made of timber 12 inches by 24 inches. The posts are mortised into the sills, and recesses cut for the bearing blocks of the cam shaft, on one side, at the necessary height. The frames or posts are generally braced either from the front or back of the battery, according to the way the power is transmitted to the cam shaft. Above the top of the mortar box is one set of wooden guides, and another set is placed above the cam shaft. These guides are about 7 feet 9 inches apart, and are made of plank 4 inches thick and 15 inches wide. In some instances, when the guides are new, thin slats of wood are put in between the guides, and, as they wear, the slats are dispensed with.

The milling plants in this colony consist of stamps with rock breakers; but each millman has different ideas as to the weight, speed, and drop of stamp, and also as to the depth of the mortar. The most modern plants are constructed so that the ore coming from the mine is dumped on a grizzly, made of longitudinal bars, 3 inches by 1 inch, and about 12 inches in length, the fine material passing through the grizzly into the ore bin, and the large pieces falling on the floor, where rock breakers are placed, and the ore passing the breakers falls into the same ore bin as the ore that went through the grizzly. In some of the mills ore feeders are made fast to the front of the ore bin, and at others Challenge feeders

are used. Where ore feeders are made fast to the front of the bin there is less space required between the ore bin and the mortars. The chutes from the feeders are made so as to fold up against the bin when any work requires to be done on that side of the battery.

A desideratum in constructing a stamp battery is to have large bins for holding a fair supply of ore. The height from the bottom of the mortar to the floor where the ore is deposited on the grizzly should be at least 40 feet, and from the mortar all the pulverized ore should pass over the tables and through all the different processes of treatment by gravity.

(TO BE CONTINUED.)

## Exploration of the Lower Depths of the Earth.

A somewhat startling, if not amusing, statement was recently made by C. A. Parsons in his presidential address to the engineering section of the British Association, in discussing a proposition to investigate the interior of the earth to great depth, for purely scientific purposes, and in no way connected with mining, though the estimates made were based upon experience gained on the Rand. Concerning this novel and interesting proposition, he said:

There were many problems of the highest importance in physics, engineering, chemistry, geology and the arts of which the investigation might probably prove of great benefit to the human race, but would involve considerable—sometimes very great—monetary cost. In many cases no patents would give adequate protection; in some there was no subject matter of novelty and importance involved. In others the probable duration of the investigation was so long that any initial patents would have expired before a commercial result could be reached. In any of these circumstances there would be no inducement to business men or financiers to undertake the risk. As an illustration of his meaning he took two investigations. One was the problem of aerial navigation. Another, and perhaps more important, investigation, which had not been attacked to any material extent, was the exploration of the lower depths of the earth. At present the deepest shaft was, he believed, at the Cape. It was a little over 1 mile in depth. The deepest borehole was one made in Silesia by the Austrian Government, of about the same depth. What would be found at greater depths was at present a matter for conjecture. To sink a shaft to a great depth presented no unsurmountable difficulties beyond those incidental to an enterprise of considerable magnitude involving the ordinary methods of procedure and the ordinary methods adopted by mining engineers. That there would be some departures from ordinary practice, on account of the great depth, it was true, but these were more of the character of detail. On the design of this boring he had consulted John Bell Simpson, the eminent authority on mining in the north of England. The shaft would be sunk in a locality to avoid, as far as possible, water-bearing strata and the necessity of pumping. It would be of a size usual in ordinary mines or coal pits. The exact position of such shaft would require some consideration as to whether it should commence in the primary or secondary strata. It would be sunk in stages, each of about ½ mile in depth, and at each stage there would be placed the hauling and other machinery, to be worked electrically, for dealing with each stage. The depth of each stage would be restricted to ½ mile in order to avoid disproportionate cost in the hauling machinery and the weight of rope, as well as increased cost in the cooling arrangements arising from excessive hydraulic pressures. At each second or third mile in depth there would be air locks to prevent the air pressure from becoming excessive owing to the weight of the superincumbent air, which at from 2 to 3 miles would reach about double the atmospheric pressure at the surface. A greater rise of pressure than this would be objectionable for two reasons—first, from the inconvenience to the workmen; second, from the rise of temperature due to the adiabatic compression of the circulating air for ventilating purposes. The air pressure immediately above each air lock would thus reach to about two atmospheres, and beneath to one atmosphere. In order to carry on the transfer of air through the air locks for ventilating purposes, pumps coupled to air engines would be provided, the energy to work the pumps being obtained from electro-motors. To maintain the shaft at a reasonable temperature at the greater depth, powerful means of carrying the heat to the surface would be provided. The amount of heat conducted inwards through the rock wall and requiring to be absorbed and transferred to the surface depended on the temperature and conductivity of the strata. But there was no doubt that it would be possible to maintain a moderate temperature in the shaft to the depth of 12 miles. During the process of sinking at the greater depths the shaft bottom would require the application of a special cooling process in advance of the sinkers, similar to the Belgian freezing system of M. Poesche, used for sinking through water-bearing strata and quicksands, and

\*Abstract from Trans. Australasian Inst. Min. Engrs.

now in general use. A number of boreholes were driven in a circle outside the perimeter of the shaft to be sunk, and through these very cold brine was circulated, thus freezing the rocks and quicksands and the water therein. When this process was completed the sinking of the shaft was easily accomplished.

As to the cost, rate of boring and normal temperature of the rock, an approximate estimate had been made, based on the experience gained on the Rand, but including the extra costs for air locks and cooling:

Depth, Miles.	Cost, \$.	Time in Years.	Temperature of Rock
1	500,000	10	122° F.
2	1,100,000	25	132° F.
3	1,800,000	40	152° F.
4	2,700,000	55	211° F.
5	3,700,000	70	242° F.
6	5,000,000	85	272° F.

## The Desert Dry Lakes of California.

NUMBER IV.

Written for the MINING AND SCIENTIFIC PRESS by  
G. E. BAILEY, E. M.

**THE LAKE AREAS LIMITED.**—Some may think that these dry lakes of the desert are so numerous as to practically destroy their value, when the very reverse of this is the case. The lakes are comparatively few in number, and, with the exception of Death valley and Salton sea, they are of small area. In fact their total area is very small indeed when

Buckhorn lake, two townships; Danby lake, one township; Bristol lake, three townships; Cadiz lake, two townships; while the rest vary from less than a township to a single section in size. In other words the eight largest dry lakes have a total area of twenty-eight townships; while the rest probably do not have a total of over thirty townships. In brief it is wholly probable that the total wealth of the salines of the dry lakes of California are contained within an area equal to less than sixty townships of land. It will be seen later on that California contains in her dry lakes the main source of supply of borax, etc., of the United States. This fact taken in connection with their limited area give them a value that should be recognized and guarded both by the State and the Nation.

**SALINES CONFINED TO "DRY LAKES" AND THEIR BEACHES.**—The borax, sodas and niter of California and Nevada are found only in the "dry lakes," or in the remnants of the "old beach" lines of one or two of the deepest "ancient lakes," viz., Death Valley, and its neighbors, Resting Springs, and Panamint Valley. An examination of the last map in Bulletin No. 24—a general map of the State of California, showing the location of the salines—shows that nearly all of the niter locations are in the northern portion of San Bernardino county, or in the southern portion of Inyo county, in the Death Valley region. It will be noticed, also, that the presence of borax, salt and other sodas are marked at the same points. Bulletin No. 24 says:

Nearly all of the niter beds, so far as discovered, are

Salt Making on Dry Lake Near Oceanside, San Diego County, Cal.—Brine Pumped From Wells Through Single Main Pipe Line, Arranged so One or All May be Pumped at One Time.

compared with the total area of the salt marshes reserved along the tide waters of California, and wholly insignificant when compared to the timber reserves, irrigation lands or mineral lands.

In Bulletin No. 24 is given brief mention of the following dry saline lakes:

- Inyo county—Resting Springs lake; Saline valley, Salt Wells valley, Tecopah lake.
- Kern county—Buckhorn lake, China lake, Kane lake.
- Riverside county—Salton sea.
- San Bernardino county—China lake, Coyote lake, Danby lake, Soda lake, Palma lake, Searles lake and Willards lake; a total of fourteen dry lakes.

On pages 66 and 67 of the same bulletin is given the location, by township and range, of fifty-three other lakes, most of which have no names and are design-

situated in the northern part of San Bernardino county, and extend across the boundary line into the southern part of Inyo county. They are found along the shore lines, or old beaches, that mark the boundary of Death Valley as it was during Eocene times. The few outlying beds so far discovered are also located along the shore line of some one of the numerous lakes that were formed by the drying up of Lake Aubury. \* \* \*

The formation of the niter-bearing clay hills occurred, undoubtedly, in the Eocene-Tertiary, during the long intervals of subsidence characteristic of that period, and are the results of sedimentary deposits slowly accumulating in layer after layer of fine clays to a depth of probably 1000 feet or more, bedded on the upturned rocks below in horizontal strata, and subject to very little disturbance since their deposit.

Under the head of "Niter Deposits," Bulletin No. 24 describes the following places where niter is

Bartell's Borax Works, on a Dry Lake South of Calico, San Bernardino County, Cal.

nated by numbers, making a total of sixty-seven lakes known. I do not believe that there are seventy-five dry lakes all told in the desert portion of California; and I do not believe that there are any dry lakes or saline lakes of an area exceeding 1 square mile, or 640 acres, in the deserts of California that are not included among the sixty-seven mentioned in Bulletin No. 24, and shown upon the maps accompanying that bulletin. An examination of these maps shows that these lakes cover quite a limited area. The sink of Death valley is included in eleven townships; Salton sea has an area of about six townships; Saline valley a little over two townships; Panamint lake, one and one-half townships;

found in the beach formations: "Upper Canyon Beds," "Confidence," "Lower Canyon Beds," "Round Mountain" and "Pilot."

Under the head of "Borates," these same "beach beds" are described as also containing borax, or borate of lime, as follows: "Confidence," "Upper and Lower Canyon Beds," "Lower Canyon," "Owl Springs," "Pilot Beds." Under the head of "Chlorides," the same beds are described as carrying salt.

No attention has been paid in the above to niter found in the playa lakes, only the beach deposits being noted. It is clearly evident to anyone who will examine this evidence that California's valuable deposits of borax, sodas, rock salt and niter are con-

fined wholly to the dry lakes of the desert and to the old beach lines of Death Valley, and its neighbors.

**STATISTICS OF PRODUCTION.**—In considering the value of the rare salines of the State, one should first examine their record and judge of their future by their showing in the past. Fortunately for this purpose the statistics are complete, and even a cursory examination brings out most interesting facts. Borax may be taken as an illustration, using the full statistics of production, value, imports, etc. In 1864 the first borax production in the United States was made at Borax Lake, in California, the total amount being 24,304 pounds, or 12 tons, worth 39 cents a pound, or \$780 a ton. The following table of the annual production is taken from Bulletin No. 24:

BORAX PRODUCTION IN CALIFORNIA.					
Year.	Production.	Value per lb.	Value per Ton	Total Value	REMARKS.
	Pounds.	Cts.	\$		
1864.	24,304	39	780	9,178	Lake Co., Borax lake.
1865.	251,092	37½	750	91,000	Lake Co., Borax lake.
1866.	401,682	33	660	132,538	Lake Co., Borax lake.
1867.	439,824	35½	710	156,137	Lake Co., Borax lake.
1868.	64,513	33½	600	22,384	Lake Co., Borax lake.
1869.	Nil	35	1-5	704	Nil None produced.
1870.	Nil	30	1-5	604	Nil None produced.
1871.	Nil	31½	625	Nil	Nil None produced.
1872.	280,000	32	640	89,600	Lake Co., Lake Hachinhama.
1873.	1,030,000	24 4-5	496	255,440	San Bernardino Co., 750,000 lbs. Other counties, 280,000 lbs.
1874.	1,829,771	4 1-5	284	259,427	San Bernardino Co., 1,729,891 lbs. Other counties, 99,880 lbs.
1875.	2,336,000	12½	247½	280,080	San Bernardino Co., 2,147,000 lbs. Other counties, 189,000 lbs.
1876.	2,878,909	10½	301½	312,537	San Bernardino Co., 2,752,000 lbs. Other counties, 126,909 lbs.
1877.	1,986,970	9½	195	193,705	San Bernardino Co., "marshes."
1878.	746,840	8½	161½	66,257	San Bernardino Co., "marshes."
1879.	727,146	9	180	65,443	San Bernardino Co., "marshes."
1880.	609	12½	245	119,245	San Bernardino Co., "marshes."
1881.	690	13½	275	189,750	San Bernardino Co., "marshes."
1882.	732	13½	375	201,300	San Bernardino and Inyo Co., "marshes."
1883.	900	14½	95	265,500	San Bernardino and Inyo Co., "marshes."
1884.	1,019	9½	195	198,705	San Bernardino and Inyo Co., "marshes."
1885.	942	8½	165	155,430	San Bernardino and Inyo Co., "marshes."
1886.	1,385	6½	135	173,475	San Bernardino and Inyo Co., "marshes."
1887.	1,015	5½	115	116,725	"marshes."
1888.	1,405	7	140	196,630	San Bernardino, Calico district, Ventura Co.
1889.	905	7	140	145,473	San Bernardino, Calico district, Ventura Co.

\* Refined. † Crude.

**RAPID INCREASE OF CONSUMPTION.**—The following is a condensed tabulation from the table just quoted. Special attention is called: (1st) to the rapid increase of the amount produced; and (2nd) to the equally rapid decrease in the cost to the consumer.

Year.	Tons.	Value Per Ton.	Value Per Pound.	Total Value.	Average.
1864....	12	\$780	.39	\$ 9,478	1 ton per month.
1874....	914	284	.14 1-5	259,427	76 tons per month.
1884....	1,019	195	.09½	198,705	85 tons per month.
1894....	5,770	140	.07	807,807	480 tons per month.
1901....	22,231	145	.07¼	894,505	Nearly 2000 tons per month.

During the first ten years of the growth of the industry the output increased from an average of one ton a month to seventy-six tons per month; in the next decade this was increased to eighty-five tons per month, an increase of over 12%; in the third decade it had increased 480 tons, an improvement of over 500% on the preceding decade; and in the seven years of the fourth decade of the existence of the industry, it has reached an average production of nearly 2000 tons per month, or over 400% on the preceding decade. Anything like this increase during the century to come would tax the resources of all deposits almost beyond computation, or belief. The lowering of prices was, until 1888, due to the competition between the Nevada and California producers.

In 1888, the Pacific Coast Borax Co. formed a combination of the various works of California and

Nevada, maintaining steady prices. The rapid increase of production is due to the extension of the sphere of usefulness of boracic acid and its compounds in the various fields of industry and art. Special attention will be called to this farther on, as it has a most important bearing upon the question of the value of these "dry lakes." In connection with the increase of consumption, demanding an ever increasing production, one should not forget the rapid increase of the population of the United States.

The following table from Bulletin No. 24 shows the amount and value of the borates imported into the United States from 1867 to the end of 1901:

IMPORTS OF BORATES INTO THE UNITED STATES.						
Year.	Boric Acid.		Borates, Crude.		Borax.	
	Pounds.	Value.	Pounds.	Value.	Pounds.	Value.
1867.....	770,756	\$73,396	5,672	\$711	49,652	\$6,601
1868.....	243,993	22,845	22,293	2,985	79,183	10,127
1869.....	998,033	109,974	54,822	8,011	89,695	12,799
1870.....	1,166,145	173,806	2,616	322	97,078	14,511
1871.....	1,204,049	185,477	5	1	134,927	20,705
1872.....	1,103,974	191,575	22,500	8,000	33,542	6,288
1873.....	1,232,006	255,186	Nil	Nil	9,284	2,152
1874.....	233,255	52,752	Nil	Nil	3,860	1,253
1875.....	41,742	6,280	588	78	5,153	1,224
1876.....	137,513	15,771	Nil	Nil	3,145	691
1877.....	107,468	11,231	55	12	3,500	676
1878.....	22,839	651	286	31	3,492	514
1879.....	306,652	21,888	Nil	Nil	3,472	490
1880.....	243,723	18,473	22,122	742	15, 78	2,011
1881.....	157,058	15,771	Nil	Nil	4,136	865
1882.....	536,335	71,341	Nil	Nil	10,664	3,062
1883.....	4,334,432	580,171	Nil	Nil	5,611	1,359
1884.....	44,512	4,484	142	84	7,332	1,691
1885.....	48,517	4,035	Nil	Nil	240	41
1886.....	430,655	26,248	4	4	.....	.....
1887.....	376,184	19,885	33	4	.....	.....
1888.....	457,777	26,394	455	38	.....	.....
1889.....	676,736	36,814	Nil	Nil	.....	.....
1890.....	867,802	49,967	29,608	800	.....	.....
1891.....	666,765	41,019	414,151	17,681	.....	.....
1892.....	701,625	39,418	40	6	.....	.....
1893.....	771,775	40,568	543,967	13,659	11,390	1,327
1894.....	398,990	19,282	441,066	11,427	3,512	425
1895.....	925,158	42,056	4,234,261	105,604	612,730	26,429
1896.....	555,769	21,899	4,307,100	104,951	11,376	796
1897.....	.....	.....	5,204,612	79,268	19,087	1,122
1898.....	.....	.....	4,235,856	92,108	10,232	962
1899.....	582,002	20,560	42,165	2,979	51,221	3,508
1900.....	473,251	17,436	58,294	4,306	273,706	9,957
1901.....	725,005	26,629	99,692	8,953	545,045	20,643

An examination of this table shows that the amount of "boric acid" imported into the United States in 1901 was less than that imported in 1867; the amount imported in 1867 being 385 tons against 362 tons in 1901, while the value had dropped from \$73,396 in 1867 to \$26,629, or less than one-third of the value imported in 1867. The amount of "crude borates" and refined "borax" imported in 1901 was only 321 tons, worth \$29,626, against a home production of 22,221 tons, worth \$894,505, for California alone. The production of borax, therefore, shows a phenomenal increase in the demand each decade. Its price has fallen to a point that permits its use in a wide range of industries. This vast trade is being almost wholly supplied from the raw material of California; only a small amount being produced in Nevada. The imports from abroad have fallen to insignificant amounts. America protects her coal fields and her salt beds from exhaustion, although they exist in nearly every State of the Union in huge areas that measure into thousands of square miles; and she

should protect the deposits of rare, unique and useful salines whose existence is confined to certain dots on the desert along the border line of California, Nevada and Oregon.

(TO BE CONTINUED.)

### Gypsum at Nephi, Utah.

The United States Geological Survey has recently published a description of the occurrence of gypsum at Nephi, Utah, which cannot fail to interest those in the vicinity of gypsum deposits elsewhere. It is included in a bulletin (No. 225) under the title "Contributions to Economic Geology, 1903." The author of this paper is J. M. Boutwell, who, in December, 1902, visited this immense deposit of rock gypsum in Juab county. It is the largest well-known deposit of rock gypsum in Utah, and forms the entire mass of a prominent spur at the entrance to Salt Creek valley. The exposed portions of this body are about 300 feet thick, 500 feet high along the bedding, and at least 700 feet long on the strike. The present paper is a portion of a more comprehensive report by Mr. Boutwell on "Gypsum Deposits in Utah," included in Bulletin No. 223, entitled "Gypsum Deposits in the United States." Both bulletins (Nos. 223 and 225) are published for gratuitous distribution and may be obtained on application to the Director of the United States Geological Survey, Washington, D. C.

The most important fact shown by analyses of samples taken from the deposit at Nephi, next to the determination of their high gypsum content, is that the first-class rock, as well as the "waste" rock, includes between 22% and 23% of anhydrite. It is thought that the presence of anhydrite might retard the "setting" of the gypsum, as the former acts like artificially dehydrated gypsum, which takes up water very slowly and without hardening. It is highly probable that anhydrite occurs in a large per cent of other gypsum deposits, so that it would be advisable to have further reliable analyses of other gypsums that have proved suitable for the manufacture of plaster of good setting quality.

Several other deposits of value are known in the Salt Creek valley, east of the main body. The most important of these is on the north side of the creek, about ½ mile east of the Nephi plaster mill. They include rock gypsum of good grade and impure varieties. The great body at the mouth of the valley is, however, the only gypsum deposit in Utah now exploited to any considerable extent. It was known before the town of Nephi was settled, and has probably been known to the whites for nearly eighty years. About thirty-five years ago a claim 600 by 1500 feet in dimensions was formally located, and in 1882 this was patented by John Hague and others under the name of the Juab Plaster & Mining Claim. Small intermittent shipments were made to Salt Lake City, in 1887, under the management of Messrs. Hyde, Hague & Whitmore, and later rock gypsum was quarried and burned in sorghum pans for local consumption. During the following year, encouraged

by the rapidly increasing demand, these parties incorporated their company and erected the nucleus of the present efficient plant, which, though not extensive, is very complete. Its output averages thirty-six tons of plaster a day, and between 7500 and 10,000 tons a year. This includes dental, casting, finishing, land, and hard plaster, each appropriately prepared for its special uses. A large and increasing demand is supplied throughout the Great Basin region, and shipments are made as far as Grand Junction on the east, Los Angeles and Hawaii on the south and west, and Victoria on the north.

### THE PROSPECTOR.

It is an easy matter to mistake one mineral for another, but the principal thing with the prospector is to find minerals and ores which he can turn to good account commercially. The really valuable ores which occur in considerable quantities are comparatively few, while the mineral species number several hundred, the greater number of which have relatively small commercial importance owing to their scarcity, or to their great abundance. The advice once given by a noted mineralogist to a prospector who had brought a score of small pieces of minerals labeled with the names of rare species was: "Look for gold. Not one of these specimens are what you take them to be, and even if they were of what use would they be to you. Look for gold. Look for something which can do you some good if you find it."

The mineral specimen from Hedley, B. C., is smallite, a cobalt diarsenide with iron and nickel, an unusual ore to carry gold in paying quantities.

The mineral specimens from Aguanga, Riverside county, Cal., are: 1. Galena (lead sulphide); 2. chalcocite (copper glance), in quartz gangue.

The rocks from Austin, Or., are: No. 1, black diorite, containing a large amount of magnetite in very fine crystals, also finely disseminated pyrite; No. 2 is a diabase in which the olivines have become serpentinized. The other minerals are still fresh, particularly the lath-like feldspars. No. 3 is a strip of aplite dike to which is attached quartz with iron sulphide. It is probably gold bearing.

At Lake Isabel, 32 miles east of Everett, Wash., work has begun on the May creek power plant by the Everett Railway & Electric Co. The head of water is unusually great. It is designed to furnish 15,000 H. P., to be carried to Everett for light and power. The intake for the 32-inch steel pipe will be 30 feet below the surface of Lake Isabel. The pipe will be carried 12,000 feet, with a fall in that distance of 2500 feet. The pressure on the pipe is 1100 pounds to the square inch. The speed of the water leaving the nozzle is 25,000 feet, or more than 4 miles, per minute. The cost of the plant will be about \$600,000.

Main Shaft of the Moctezuma Copper Co., Nacozari, Mexico.—(See Front Page).

Reduction of Copper Ore Containing Heavy Spar.

The report of the Tye Copper Company, in the Victoria division of British Columbia, published in the annual report of the Minister of Mines for British Columbia, gives an interesting account of operations there under unusual conditions. Over 42,000 tons of Tye ore were treated in the smelter at Ladysmith (shown in the accompanying illustration), producing 4498 tons of matte, which contained 3,604,474 pounds of copper, 121,932 ounces of silver and 6620 ounces of gold. The net value of this was \$562,890. In addition to the above a large amount of custom ore was treated.

The report of Superintendent E. C. Musgrave gives details of cost of mining at the Tye mine on Mount Sicker:

WAGES PAID.			
Underground:—			
Machine miners.....	\$3 50 per day of	8 hours	
Miners (hand drillers).....	3 00 per day of	8 hours	
Timbermen.....	3 25 per day of	8 hours	
Muckers and trammers.....	2 50 per day of	8 hours	
Above ground:—			
Carpenters and timber framers, loggers, mechanics, hoist engineers and blacksmiths.....	3 50 per day of	9 hours	
Surface hands (white).....	2 50 per day of	10 hours	
Surface hands (Chinese).....	1 00 per day of	10 hours	

COST OF MINING PER TON OF ORE SHIPPED.	
	Per Ton.
Stoping.....	\$1 359
Proportion for exploration.....	469
Surface work.....	124
Ore sorting.....	641
Transportation to railway (aerial tram).....	150
Total cost of ore delivered at E. & N. Railway.....	\$2 173

Other receipts were as follows:

	Tons.
Schistose flux ore.....	1,340 9
Sandstone.....	396
Iron ore.....	551
Coke.....	2,346

BURNED ORE.—The average analysis of the burned ore delivered to the smelter was as follows:

	Per Cent.
Iron.....	10 44
Zinc.....	8 14
Alumina.....	3 61
Barium sulphate.....	34 08
Magnesia.....	Trace
Lime.....	3 46
Silica.....	22 51
Combined sulphur.....	7 42
Total sulphur.....	13 86

During the last quarter of the year (fiscal) the burned ore showed on analysis an increase of: Iron, 1.86%; zinc, 0.93%; barium sulphate, 7.66%; lime, 0.5%; combined sulphur, 0.54%; and a decrease in silica of 11.49%.

SMELTING OPERATIONS.—The furnace “blew in” on December 16, 1902, and had run 107 days (of twenty-four hours) and smelted as follows:

	Tons.
Burnt ore.....	13,853 841
Green ore.....	2,237 624
Schist.....	539 636
Silica flux.....	774 687
Slag.....	338 198
Iron ore.....	301 653
Matte.....	963 818

Total mixture.....19,009 367  
Coke used, long tons.....2,116 313

Showing an average per day of 150.387 tons of ore, or 177.657 tons mixture. The ratio of coke to ore was 1 to 7.428, or of coke used to burden 1 to 8.775.

The matte produced in 107 days’ run amounted to 1394.3 tons, showing an average assay of: Copper,

ing this period, which also includes custom ores, was as follows:

Au. Oz. Ag. Oz.										
Cu.	Per Ton.	FeO.	ZnO.	BaO.	CaO.	SiO <sub>2</sub> .	Al <sub>2</sub> O <sub>3</sub> .	MgO.		
37	12	Trace	17 68	0 44	26 16	7 92	33 34	10 75	Trace	

The improvement in the slag assays for copper over the previous year is due in part to the increased settling capacity of the receivers at the furnace; in part to a reduction in the specific gravity in the slags by the admixture of suitable fluxing ores, which were not procurable in the earlier stages of our operations; in part to the lesser amount of ZnO in the slags, as a result of the admixture of other ores referred to; and in part to altered furnace practice, as a result of experiment with such ores. The specific gravity of the mattes was between 4.7 and 5.0 and of the slags between 3.6 and 3.8.

Of the total ore smelted, 62.8% was burned ore, 22% raw sulphide ore and 15.2% raw custom ore—or 62.8% burned ore and 37.2% raw ore, from which a shipping matte of from 40% to 45% copper was produced in one smelting operation. Comparing the furnace work of the past six months, as shown above, with the last annual statement (the figures previously given), it will be seen that the capacity of the furnace has been raised from 177 tons to 249.6 tons—an average of 72.6 tons per day.

An Electrolytic Process for Copper.

The Siemens & Halske process of copper extraction consists in leaching finely pulverized, roasted ore at 90° C. with ferric sulphate solution containing free sulphuric acid. The ferric sulphate is reduced to ferrous, and copper is dissolved as sulphate. Electrolysis of the solution in a diaphragm cell gives copper at the cathode, and oxidizes ferrous sulphate to ferric at the anode. This is an old process, having

Smelter of the Tye Copper Co., at Ladysmith, B. C.

The total amount of development work done during the (fiscal) year has been: Drifting, 1095 feet; cross-cutting, 511 feet; sinking, 193 feet; upraising, 319 feet. The average costs per lineal foot have been: Drifting, \$9.15; crosscutting, \$6.77; sinking, \$18.31. upraising, \$11.59.

The total tonnage of ore delivered to the smelter during the period under review was 21,565 tons, of which 20,688½ was first-class ore and 877 tons copper-bearing schists (for flux). Of the ore, 2930 tons were sent from the dump and 17,758½ tons from the mine. The assay values of the ore are given in the report of the smelter.

SMELTER REPORT.—The report of the manager of the smelter at Ladysmith, Thomas Kiddie, is exceedingly interesting from a metallurgical standpoint, as showing the practical results obtained in smelting an ore carrying over 35% of barium sulphate—a problem, as far as can be learned, not met with outside of this camp. The following figures show the results of the first few months’ run on this ore, which, as just intimated, is unique in character, and concerning which no previous results were obtainable as a guide; consequently, as must be recognized, the work was largely experimental:

ORE RECEIPTS FROM SEPTEMBER 22, 1902, TO APRIL 30, 1903.	
	Tons.
Copper-bearing ore (roughs).....	15,069.725
Copper-bearing ore (fines).....	5,173.785
Total.....	20,243.510

The average assay of this ore was:	
Copper (wet assay), per cent.....	4.43
Silver (ounce), per ton.....	2.76
Gold (ounce), per ton.....	0.12

41.95% (dry); silver, 29.67 ounces per ton; gold, 1.483 ounce per ton. The yield per ton of ore was:

Copper (dry).....	3.63%, valued at 11.5c per pound =	\$8.349
Silver.....	2.57 ozs. per ton, valued at 50.82c per oz. =	1.306
Gold.....	0.123 oz. per ton, valued at \$20 per oz. =	2.576

Yield value per ton of ore.....\$12.231

SLAGS.—The following is the average analysis of the slags produced:

	Per Cent.
Copper.....	6 65
Iron.....	15 71
Silica.....	25 79
Alumina.....	11 51
Zinc oxide.....	10 43
Barium oxide.....	30 55
Calcium oxide.....	3 38

Experience and experiments with the ore have materially improved the practice. Mr. Kiddie has furnished the following absolute average figures of the results of the last six months’ work. He says, under date April 29, 1904:

Answering yours of the 27th inst., I herewith enclose a statement covering the smelter operations during the last six months. During this time the furnace was in blast 123 days of twenty-four hours each—an average of twenty days per month—and smelted 30,703 tons of material, of which 28,290 tons were ore, making a daily average of 249.6 tons of material and 230 tons of ore per day, from which we shipped, in the form of matte, 2,275,997 pounds of copper, 72,207.8 ounces of silver and 4592.18 ounces of gold. A general analysis of the burned ore used during this period is as follows:

Fe %.	SiO <sub>2</sub> %.	Zn %.	BaSO <sub>4</sub> %.	S (in Sulphides, %).
11.45	19.36	6.97	38.87	6.56

While the general analysis of the slags produced dur-

been described in British patents 14,033 of 1886 and 3533 of 1889. M. DeK. Thompson Jr. has studied the reactions (Electrochemical Industry). Raw copper pyrite is not appreciably attacked by ferric sulphate, but after roasting is readily soluble. Copper can be deposited from an acid solution of ferrous and copper sulphates until the concentration reaches a low value—that is, with a current density of .47 ampere per 100 square centimeters until the concentration of copper in solution is .5%, at which point spongy copper begins to form. Using carbon electrodes, the oxidation at the anode is at first very efficient, but as the concentration of ferrous sulphate decreases the process gradually falls off in efficiency.

Pitchblende at Cripple Creek, Colo.

A vein carrying yellow oxide of uranium and black pitchblende has been discovered in the south slope of Rhyolite hill in Cripple Creek district in the property of the Rhyolite-Beacon Mining Co. The vein is 2 feet wide in a shaft 35 feet deep and appears to be continuous. Samples of the ore are at present in the hands of assayers. With only one and a half ounces of the crude ore, separated from the plate by twenty-four sheets of black paper, very good photographs have been made on a forty-eight-hour exposure. It is reported that this ore has been found in three different places. Thus far this remarkable property of uranium ores has not been put to practical use, but it will probably be employed in the photographic art and otherwise.

# Mining and Metallurgical Patents.

PATENTS ISSUED SEPTEMBER 6, 1904.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

ORE CONCENTRATOR.—No. 769,231; G. E. Perkins, Providence, R. I.

Device comprising concentrating table, distributing trough arranged near one side thereof and having perforations in outer side, trough being elevated, whereby middlings may pass thereunder; second trough elevated above plane of discharge trough and terminating at point beyond outer side of latter and nearer concentrate discharge than initial pulp feed, means for collecting middlings from table and delivering them to elevated trough and means for supplying water to distributing trough.

ORE CONCENTRATOR.—No. 769,431; I. A. Cammett and F. E. Shepard, Denver, Colo.

In combination in concentrator table, riffles, and separating pieces 42 forming table surface and between which riffles are placed, riffles lying between and projecting above separating pieces for portion only of their length and merging into and continuing between separating pieces toward tail end; in the end-shake mechanism for concentrator, pivotally mounted oscillating frame or member thereof provided with two adjusting screws, each having screw-threaded box thereon, crank and pitman actuating one of boxes, and link actuated by other of boxes and connected to parts to be shaken, screws acting to adjust boxes toward and from center of motion from frame or member to vary operation of mechanism.

APPARATUS FOR BORING WELLS.—No. 769,371; J. C. Adkins, Stockton, Cal.

In apparatus of kind described combination of suitable casing provided with plurality of vertical slots near bottom thereof, steel springs riveted to outside top of casing and extending downwardly over slots, springs being bent inwardly into inverted L shapes at bottom of casing, steel blocks riveted to springs

and extending suitable distance through slots, steel springs riveted to blocks inside casing and extending suitable distance upward therein, suitable driving key mechanism fitted between and above last-named springs, and suitable chisels fastened to inverted L shapes on first-named springs.

DRIP CONCENTRATOR.—No. 769,211; C. F. Du Bois, Denver, Colo.

Drip concentrator, consisting of series of troughs having perforations or apertures provided in bottoms thereof, series of troughs inclined in opposite directions suitably suspended within frame, each series of troughs except lowest discharging into lower one, series of platforms secured within frame upwardly inclined toward middle, one of platforms placed beneath each series of troughs, movable needles, points of which are adapted to operate within apertures being secured to bottom of troughs, drum water wheel placed beneath lower end of one of series of troughs, revolving screen secured to frame at upper end of top series of troughs, water wheel adapted to impart revolving movement to revolving screen by means of suitable belt or cable operating around sheaves.

PROCESS OF UTILIZING WASTE FURNACE GASES AND SIMULTANEOUSLY REDUCING ORES.—No. 769,263; J. Herman, Bisbee, Ariz.

Process which consists in subjecting metallic oxide to action of furnace gases to reduce metallic oxide to lower oxide or metallic state, burn carbon monoxide present to carbon dioxide and recover heat values lost by incomplete combustion of fuel at one and same time, utilizing heat values so recovered for extraneous purpose, and admitting air to metallic oxide at intervals to adapt same to do its work continuously.

PLACER MINING MACHINE.—No. 769,489; N. W. Pulsifer, Philadelphia, Pa.

In machine of character described, hopper supported in elevated position by suitable framework, inclined grizzly leading therefrom, in position to receive material discharging from hopper, chute into

which grizzly discharges, series of conical shaped screens suitably mounted to receive material from chute, extended assorting table suitably positioned with relation to screens, lateral chutes steeply inclined having upper ends adapted to receive material from screens and having lower ends oppositely curved and downwardly curved, with discharge ends extending in direction parallel with assorting table, and adapted to spread material thereover by impetus.

TAKE-UP DEVICE FOR HOISTING BUCKETS.—No 769,232; E. B. Perry and W. Bassett, Bay City, Mich.

In steadying device for hoisting-buckets and like, combination of cable secured to bucket; winding drum for cable; drum being loosely mounted on revoluble shaft; brake band engaging drum; ratchet wheel loosely mounted on shaft and carrying ends of brake band; pawl carried by fixed support and engaging ratchet wheel; pawl pivotally mounted on ratchet wheel; together with second ratchet wheel keyed to shaft and adapted to be engaged by pawl.

QUARTZ MILL.—No. 769,610; C. E. Humphreys, Walker, Cal.

In quartz or like mill, combination with rotatable support and series of pivoted hammers hung thereon, of segmental die having anvil formed upon receiving end thereof and projected into range of action of striking face of hammers whereby hammers are capable of striking percussive blows upon anvil, means whereby hangers after striking blows turn about pivots and drag over curved face of die, means whereby centrifugal force of grinding hammers is augmented by weight of temporarily idle hammer, and means for feeding ore upon anvil between strokes of hammers.

MINING MACHINERY.—No. 769,461; E. S. Bennett, New York, N. Y.

In combination with car body, vertically moving rack bar arranged to one side of same, and working in support connected with car body, gear wheel meshing with rack bar, worm wheel on shaft of gear wheel and vertically extending shaft and worm thereon meshing with worm wheel and means for operating vertically extending shaft.

PROCESS OF EXTRACTING GOLD FROM ORES, ETC.—No. 769,280; H. S. Stark, Johannesburg, Transvaal.

Process of extracting metallic gold from acid pyritic auriferous ores, consisting in treating crushed ore with solution of sulphocyanide of alkali metal, in presence of oxidizing agent, including atmospheric oxygen, whereby gold is dissolved out by nascent cyanogen and hydrocyanic acid; produced in presence of acid in such ore by mutual reaction of sulphocyanide and oxidizing agent; and afterward separating gold from solution thus formed.

METHOD OF EXTRACTING PRECIOUS METALS FROM THEIR ORES.—No. 769,254; S. C. C. Currie, New York, N. Y.

Step in art of treating ores containing precious metal and sulphur, which consists in subjecting ore to action of hot vapor containing hydrogen, and withdrawing sulphureted hydrogen gas therefrom, then roasting ore in presence of air.

# Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE MINING AND SCIENTIFIC PRESS.

## ALASKA.

A mineral strike has been made by the graders of the Alaska Central Railroad, 14 miles inland from Seward, the coast terminus. A. W. Swanitz, chief engineer of the road, says copper and gold ore has been found in two veins on the line of railway. In blasting out a 30-foot cut a fissure vein from 10 to 14 feet wide has been opened. With Eastern men, Swanitz will put in a stamp mill and other machinery to start mining.

The Bartels Co., at Tin City, near Teller, has built a tin concentrating plant. The tin belt is being developed by several companies.

Superintendent B. Thane of the Eagle River M. Co. of Macon, Ga., operating at Eagle, says during the past year they have put up buildings at Eagle cove, near Juneau, built 3 1/2 miles of car tram, several miles of wagon road to the upper camp, run 550 feet of tunnel, built a sawmill, assay office, 10-stamp mill, with aerial tram, flumes, water pipe, etc. Superintendent Thane has thirty-five men at work.

## ARIZONA.

### Cochise County.

The Copper Queen's Holbrook mine at Bisbee will operate a six-compartment shaft, says the Bisbee Review. At present it is running a four-compartment. This was some time ago found inadequate. The old compartment will be used for sinking, pumping and handling of timbers. The Holbrook shaft is down 500 feet. A 100-foot winze practically gives it the 600-foot level. At the 400, 500 and 600-foot levels there are ore bodies being worked. New work proposed will carry the shaft down to the 1000-foot or 1200-foot level. For this work a 750 H. P. engine will be put in, also a battery of marine boilers. Foundation has been made at the Gardner for boilers and heavier hoist.

### Maricopa County.

(Special Correspondence).—The Phoenix mine, at Cave Creek, is being sampled, and work will be resumed next month. A few men are working at the Union mine, 18 miles north of Phoenix. Preparations are being made to work a bismuth prospect a few miles east of Phoenix. A. S. Mills has organized a company with Eastern men to work a group property in Cave Creek district.

Phoenix, Sept. 10.

The Oriental C. Co. has been incorporated by N. M. Clemens et al. of St. Louis, Mo., with E. Ganz and W. T. Smith of Phoenix, and has bought the Oriental group of copper mines at Cave Creek, north of Phoenix. The group consists of eleven claims and a millsite. N. M. Clemens is president and A. S. Mills is superintendent.

### Mohave County.

W. H. Cushing, president of the Stockton Hill M. Co. at Stockton Hill, says the mine is opening up lead and zinc ores. The company will build a milling plant on Stockton Hill.

Gold Roads reports says a strike of ore has been made in the crosscut from the 500-foot level in the Gold Roads mine, near Acme. Drillings from the vein on the foot wall run \$100 per ton and 8 feet of ore penetrated by the crosscut show payable values. Several machines will be put in to drive the drifts and open up the ground.

### Final County.

(Special Correspondence).—B. Pearman will continue shipments of silver-lead ore from his mines, near Silver King.

Silver King, Sept. 10.

### Santa Cruz County

Twenty-five more miners have been put to work at the Mowry mine, near Harshaw, which increases the number to 100 men, and two more steam pumps will be put in, the increased flow of water on the 400-foot level having taxed the machinery now in operation.

### Yavapai County

D. E. Dumas of Prescott says the Producer mine, near Palace station, is opening up values in gold, copper, silver and lead. Further equipment is needed.

Superintendent C. K. Tibbets of the Pfau G. M. Co., operating at Cherry Creek, says he will put in additional machinery.

M. Murphy of the Oro mine on Minnehaha flat, says the double-compartment shaft is down 500 feet. The ore bodies are 5 feet wide, free milling, and will average \$6 a ton in gold. Water has slightly increased as depth is attained. There are twenty-five men at work, but more will be put on and drifting started. The property is equipped with two mills—a Chilean

and a 20-stamp -- having combined capacity of 200 tons a day. The Oro mine (formerly the Boaz) is 45 miles from Prescott and 9 miles south of Crown King.

## ARKANSAS.

### Marion County.

Yellville reports say the Dennison mill is in full operation and several mines around it are keeping it busy. The Anna mine is working a full number of men and the Hill Fontaine mine is getting out ore. I. C. Hay, who has a fifteen-year lease on the Dennison mill and mine, says he has opened up one of the old shafts of the Dennison and has struck a 7-foot face of ore. The Silver Hollow mine is shipping zinc concentrates. The mine is working thirty-five men and turning out an average of fifteen tons of zinc ore daily. The superintendent expects the mine alone will ship two cars of ore each week.

### Newton County.

It is reported the Speers M. Co. will absorb the Flynn M. Co. Both companies have holdings in Newton county, near Ponca, and Boone county, near Harrison.

The Ponca City mines at Ponca are turning out satisfactorily, says Superintendent J. W. Clemmer. A number of short tunnels and shafts have been made along a fault and a vein of carbonate of zinc has been opened up.

## CALIFORNIA.

### Amador County.

(Special Correspondence).—The Julianne and Diana mines, 6 miles east of the town of Sutter Creek, are being worked by a Seattle, Wash., company. These claims had been idle several years. A 6-stamp mill is on the ground. It is the intention to sink a new shaft and develop the property. A shoot of ore cropping in the bed of Sutter creek shows gold. At the South Eureka mine twenty stamps of the Balli mill, near Sutter Creek, are being set up. The lower levels of the South Eureka are reported to show improvement.

The Wildman-Mahoney mine is laying in a stock of mining supplies, timber, etc., and it is reported operations are to be resumed on a large scale. The principal work will be through the shaft of the Lincoln mine, which is down 2000 feet, about 600 feet below the deepest workings of the former mine. The electric railroad from Ione to Sutter Creek and Jackson is under construction. It is expected to have it running in December.

Sutter Creek, Sept. 13.

C. Glenn, A. B. McLaughlin and M. Robinson of Volcano have leased the Whitmore mine of that place and will operate it.

Sinking continues at the Argonaut mine near Jackson. The shaft will go to 2500 feet. Ore is being stored, but the mill will not be started until sinking operations are completed. W. F. Detert is president and manager.

Sinking at the Argonaut mine, near Jackson, will be continued to depth of 2500 feet from 2400 feet. Several thousand tons of ore have been piled on the dumps. It is intended not to start the mill until sinking operations are completed and levels opened.

At the Fremont Co. mine at Amador City the mill is running full capacity, and 100 men are employed in mine and mill. The non-union crew is reported giving satisfaction.

The Standard Electric Co. has started improvements at Electra. About 100 men are cutting a trench in which to lay another pipe line from the penstock to the power plant. Additional generators will be put in equal in capacity to those now in use. The ditches will also be improved.

### Butte County.

Men are at work sinking shafts on a flat on middle fork of Feather river, near Cromberg, near Oroville, for prospecting the ground for dredging process. The work is being done for W. P. Hammon of Oroville.

### Calaveras County.

The work of extending the electric wires to the Marshall mine, near San Andreas, is under way. The works at the mine will be run by electric power and the plant is being put in place. The Marshall mine is being operated by the California Gold Placer M. Co.

### El Dorado County.

At Coloma, on the south fork of the American river, W. A. Bell will prospect the river gravels with a Keystone drill. A dredger will be built to work the ground.

F. B. Norton, superintending work at Zantgraf Extension mine, near Loomis, says work is progressing and ore is being opened up. They will build a mill.

It is said the Eagle Bar Placer M. Co., Ltd., which bought the Channel Bend and adjoining claims on the American river near Josephine, will put on more men. Work is being done on the claims,

the road from Josephine to the river is being repaired and other improvements made. At the Nongrasser mine, on Texas Hill, near Georgetown, the mill has been started up.

### Mariposa County.

(Special Correspondence).—Difficulty has been experienced in reopening the shaft of the Princeton mine. The timbers used are 12x12-inch and have been on the move from the collar of the shaft. A depth of 175 feet had been sunk, but on the morning shift of the 5th inst. a run of surface ground occurred, breaking and twisting fifteen sets from the bottom up. Fortunately, the miners had time to reach the top. They are now bracing and retimbering the wrecked sets. They were nearly through the original cave due to the fire, and the weight of the loose surface ground broke through; as there is practically none of this last cave in the bottom, consequently it either went into the old workings or into the shaft below the burned ground. Considerable charcoal was sent to the top, being used in the forge, the foreman remarking: "It ought to be good coal, it cost enough." Air pipe is being placed in the old air shaft, the intention being to strike the working shaft at the 800 level and suck out the foul air, etc., so that the extent of the cave can be determined. In the event of being in too bad a condition, a new shaft may be sunk.

Mt. Bullion, Sept. 12.

### Nevada County.

At the Brunswick mine at Grass Valley the electrical pumping plant is operating satisfactorily and additional ore shoots are being opened up in the lower levels. Increase of the milling capacity to fifty stamps is proposed. Free gold is showing in the quartz in one of the drifts in 1250 level, the ledge being 15 feet in width between walls. Two ledges are being worked on, while a third is being run for. Fifteen of the twenty stamps are in operation, says Manager C. H. Mallen. The Brunswick has forty men working, but is increasing the number.

L. Williams, superintendent of the Niagara mine, near Nevada City, says extension of the Snyder tunnel will be started. It is on the Snyder claims included in the Niagara lease and bond and will open up the Niagara ledge west from the shaft workings.

Stamps are again dropping in the mill at the Idaho-Maryland mine at Grass Valley. The shaft is retimbered down 90 feet. The mill is being overhauled and ten stamps are dropping on the refuse matter being cleaned up from underneath the floor, and the first day's run resulted in 10 ounces of amalgam being cleaned up, says Superintendent C. B. Laksenan.

### Placer County.

A. J. Tubbs of Lewistown, Mont., has opened up the Lundquist mine, on Auburn ravine, near Auburn. He intends to begin work on the tunnel. G. K. Orr is superintendent.

### Plumas County.

Superintendent Myers, for W. P. Hammon of Oroville, is prospecting the Langhorst ranch at Cromberg, near Quincy, to ascertain value of underlying deposits, with a view of putting in a dredger. Several shafts have been put down.

### San Diego County.

Unwatering the Stonewall mine at Cuyamaca is under way. The shaft is 640 feet deep. As the water is pumped out the shaft will be retimbered, and mining will be begun at the 300-foot level, although it is intended to pump out all the water and retimber the entire shaft. Manager Clark says he will start the stamps to work the tailings of the dump until the 300-foot level has been reached.

### Shasta County.

The Washington mine, west of French Gulch, is producing ore. C. Webb is operating the mine under lease. He has the 5-stamp mill in operation. There are a few sub-leasers working under Webb's lease. The Black Oak M. Co. is owner of the property. The ore chute is being worked 60-feet below the tunnel level.

### Sierra County.

J. M. Harper has men working at the Diadem mine, and reports having struck a ledge 8 feet wide that will mill \$20 a ton. The Diadem is in Forest, said to be between slate and serpentine formation, and on same contact as the Tightner mine. A mill will be built. The Keystone mill is nearing completion. Poles have been put in place for the power line, and pipes are on the ground to furnish power for the generators.

At Pike City the Alaska mine is being reopened. Superintendent St. John has started work of extending the drain tunnel. This will tap the main shaft at a depth of 90 feet, and as soon as completed retimbering the shaft will begin.

### Siskiyou County

(Special Correspondence).—The Salmon River Quartz M. Co., with headquarters at Portland, Ore., owns in Hicky gulch, tributary to Salmon river, a group of four

claims, the vein matter 18 inches to 4 feet in width of quartz, and no sulphurets in the surface development. Development is by driving a crosscut tunnel to reach the main ledge. A tunnel in 200 feet will give backs of 700 feet.

Cleavers and Swain, at head of White gulch, 7 miles from Sawyers Bar, and 4800 feet altitude, continue developing a group of eight claims. The formation in that section is black slate, white quartz streaks intermingling. A large proportion of the values has been obtained by quarrying, the ledges being 7 to 8 feet in width, with \$7 gold value to the ton. Recently a flume 3000 feet in length has been completed to take the place of the old one, and this runs water across three gulches to a mill of four stamps and two Frue vanners, the stamps having been in use ten years and the Frue vanners only two years. Tunnel development will proceed during the coming winter and the mill will be in use excepting two months of the severest weather.

E. Hickey, owning a group of claims on White gulch, has had his small stamp mill idle since last November. He has ore ready for milling, but lack of water prevents running the mill. He is opening up a 4-foot quartz vein in slate and porphyry, which is free milling at the surface. H. Finley and J. Johnson own on one of the gulches tributary to White gulch two claims, the ledge matter averaging 12 inches quartz, with iron and galena sulphurets carrying gold, values ranging \$30 a ton. The property is under working bond till July 1, 1905, to W. E. Baldwin on a 50% royalty.

The Czarina G. M. Co. of Chicago, Ill., is developing a group of six claims in Liberty mining district, on the mountain dividing North Fork of Salmon river and North Fork of Russian creek, with C. Wolf superintendent. In this section the general formation is diabase, the ledge or vein matter, 8 to 12 feet in width, being enclosed in "birdseye" porphyry and the ore quartz free milling, with a percentage of high-grade sulphurets. Developments are by tunnels amounting to 1000 feet. A crosscut tunnel is being driven to cut ledge 200 feet below apex.

The Taylor Lake M. Co. is composed of J. W. Harris & Sons, E. S. Harris and B. F. Bassford. They own at the head of Taylor creek, on the divide separating Taylor creek and Right Fork of Salmon river, a group of six claims and millsite, with a water right covering two parallel ledges 900 feet in width. The ledge next to the granite rock is 4 to 6 feet in width, sugary quartz with percentage of high-grade sulphurets and free gold. A 40-foot tunnel gives 50-foot depth below surface. The other ledge is 8 feet in width, nearly vertical, with blue slate on the east and quartzite on the west. Mill tests give returns of \$5 gold to the ton. From present workings to the milling plant being built is 1500 feet. The ore will be sent down 700 feet by a chute, thence by track round point of divide 100 feet and by second chute to the mill. This mill is of the Krogh pattern, two stamps, triple discharge, the tailings flooding over pieces of carpet. The water right on Taylor creek owned by the company is sufficient to run a twenty-stamp mill twelve months of the year. The mill will be finished by October 1 and run by a tangential water wheel. About a mile from the Taylor Lake M. Co.'s property are two claims showing by surface development a ledge 9 feet in width between walls of slate and porphyry, and the ore free-milling quartz. The owners are T. G. Boyer of Altamont, Ill., W. E. Boyer of Etna, and J. Lewis and J. Arnold of Fort Jones. They are also owners of two claims on the same divide below the Taylor Lake Co.'s group.

Stephens Bros. of Etna are owners of four claims adjoining the Yreka M. & M. Co.'s property (the Ball mine) on the north and northeast. Stephens Bros. are driving a tunnel, already in 550 feet, to strike the north and south ledges coursing through their Illinois and Wisconsin claims, at a depth of 400 feet ledge is in slate, is free-milling ore with high-grade sulphurets. On the Liberty claim there are three short prospecting tunnels.

Development is going on at the Black Bear. John Daggett, manager, is doing work in the 200-foot level of the north and south ledges, about 365 feet south of the 600-foot shaft of the old workings. At 200 feet in the new double compartment shaft a drift will be driven 200 feet farther north to connect with the old workings. Daggett expects to increase work by November 1. The completion of the drift to the old workings will drain the Yellow Jacket claim of water, enabling bodies of ore there to be mined and milled.

On crest of mountain separating China and South Russian gulches the general formation is slate with porphyry dikes running through. Ledges are numerous, outcropping from 2 to 10 feet in width. The ore is free-milling quartz. The Blue

Jeans group of six claims, covering both sides of the divide for quite a distance, are being developed by the owners, B. G. Phillips, J. M. Hadley and W. Werst of Etna. Values in the ore average \$15 per ton. For some time a one-stamp mill and Frue vanner have been in operation. Another stamp is being added. Power is had from a Pelton wheel with 100 feet fall.

D. Malloy of Sawyers Bar has bonded to Overton Bros. his group of five claims at head of Rattlesnake creek, on Tarnes mountain. The three ledges through the claims are 3 feet in width in diorite and porphyry.

W. T. Dawson and J. E. Davis are developing a group of claims on Six-Mile creek, 12 miles from Cecilville. The property is worked by a tunnel and ore run through an arrastra, with good values returned. A road has been completed to the mine.

Sawyers Bar, Sept. 13.

C. W. Geddes, superintendent of the Blue Ledge copper mines south of Jacksonville, Or., says he is working on two tunnels and is employing twenty-five men. The ledges are showing up satisfactorily, and the Blue Ledge company will install power to operate a compressor and a power drill, and more men will be put on. The mines are at the head of Joe creek, 4 miles south of the Oregon line. B. C. Kingsbury of Spokane, Wash., is manager.

L. S. Barnes of Redding says he will build a 30-ton milling plant for the Gold Dike mine in the Salmon River district.

—The Mt. Vernon mine, at head of the divide between Greenhorn and Cherry creek, near Yreka, has forty men at work putting up the new mill, taking out ore and operating the sawmill.

#### Sonoma County.

On the 10th inst. a forest fire, which started on Big Sulphur creek, in northern Sonoma county, swept over Black mountain and destroyed the buildings of the Sonoma Con. Quicksilver Co., near Pine Flat. The Sonoma Con. is composed principally of Santa Rosa men. Last year they built a smelter, which cost \$15,000.

#### Stanislaus County.

Preparations are being made to dredge for gold in the Stanislaus river, near Knights Ferry. J. Hewell has bonded 120 acres on the river, covering a strip of land 5 miles in length below Knights Ferry.

#### Trinity County.

The dredger on the river above Trinity Center has worked steadily during the summer, being the third season it has been in operation by Payne, Clary & Keenan, owners. The gravel is said to pay 40 cents a cubic yard. W. P. Hammon of Oroville is having more ground prospected along Trinity river for dredging. He has a bond on ground at Trinity Center, which he has prospected.

#### Tuolumne County.

The Hard Times mine, north of Carters, has been bonded to the Blue Bell M. Co. of San Francisco, of which W. R. Hall is the local representative. —More men are being added at the Providence mine, near Carters. The stamps are dropping steadily on high-grade ore.

Men have been put to work at the Dreisam mine, at Arrastraville, near Carters. Drifting will be continued on the Good Luck vein which is a contact ledge. Work is under direction of Superintendent Tritenbach of the Dutch mine at Quartz.

—Development work is in progress on the Consuela mine, adjoining the Providence.

At the Black Oak mine, near Soulsbyville, the owners have put in a sawmill, capacity 3000 feet daily. —At the Rawhide mine, near Jamestown, 100 men are working and the mill running steadily, being operated by electric power.

At the Columbia mine (formerly the Holmes) on Experimental gulch, near Columbia, grading for the mill and other surface work are under way. Superintendent Phipps intends putting in a Huntington mill.

At the Ranch mine, near Columbia, a hoist has been put in, with ore bins and chute and a 3-stamp gravel mill. A 100-light dynamo and engine for running the same are being set up. Drifting is under way, though no breasting as yet is being done. There are twenty-five men at work.

The pumps at the Soulsby mine have been repaired and work resumed after a three weeks' shut down. About 300 feet of water accumulated in the shaft during the time the pump was idle. They are putting in an 80 H. P. boiler in addition to the present one. Another compressor has been added.

### COLORADO.

(Special Correspondence).—Little credence is placed in the confession of a convict at Topeka, Kan., in which he claims

to have assisted in blowing up the Independence, Colo., depot last June. He incriminates several prominent union men of the Cripple Creek district in his confession.

If the report is true, Leadville is on the verge of an industrial strife. It is stated that the operators of the district are well organized, and that they have decided not to employ any one affiliated with the Western Federation of Miners. The Federation, it is claimed, has a large following in the Cloud City, but it is believed they are not anxious for a strike, scarcely having recovered from the struggle of 1896, which, so far as can be learned, has never been declared off by the union, and in face of defeat of the strike at Cripple Creek and Telluride the past year. Leadville is one of the most prosperous camps in the State to-day.

The machinery houses of Denver report a fairly good business, and a majority of them are of the opinion that it is improving and will continue to improve. With all the mines working in the different districts, it means the installation of machinery and the employment of many men. Denver, Sept. 12.

#### Boulder County.

(Special Correspondence).—The 20-mile branch line of the Colorado & Northwestern Railroad, now building between Sunset and Eldora, will be finished December 15. This company is already operating between Ward and Boulder. This additional 20 miles of track will give Boulder county mining an impetus. Four hundred men are at work on the grade under Orman & Crook, contractors. L. R. Ford, for a number of years with the Midland Terminal and Florence & Cripple Creek Railroads, has charge of the traffic department, with headquarters in Boulder.

Sunset, Sept. 11.

(Special Correspondence).—The past few months there has been considerable interest in this county over tungsten ore. E. C. Pohle, president of the Progressive Concentrating & Milling Co., Mrs. E. C. Pohle and W. A. Brockway have secured control of the Eureka Tungsten Mining Co. and are operating on the Mabel W. Amanda L. Rex and Tiptop claims, near Boulder falls, 11 miles from Boulder. They are opening up this property by three tunnels on the vein. The vein is 22 feet wide between walls with a streak 3 feet wide of tungsten, the rest good concentrating ore. On the other side of the 22-foot vein is another streak of quartz and tungsten 1 foot wide. A surface tramway 500 feet long has been put in from the mine to the wagon road. They are producing about fifty tons of ore per day, but as soon as the milling capacity can be enlarged the output will be much greater. The tungsten obtained in this county is of superior quality, as it is free from antimony, copper, lead or bismuth. From 112 tons of ore they obtained over 10½ tons of tungsten, the total product of which yielded 68.96% tungstic acid. The product from the jigs assayed 71% tungstic acid. This product was shipped to Europe. If the price of tungsten ore continues at the present rate it will be the means of opening some large bodies of tungsten ore in Boulder county.

The Progressive C. & M. Co., E. C. Pohle, president, is operating its mill two shifts on tungsten ore from their own mine as well as custom work. They will install more tables and jigs and double the capacity of the mill.

Boulder, Sept. 11.

(Special Correspondence).—On the line of the Colorado & Northwestern Railway is located the Wood Mountain mine and mill. A few years ago experts examined this property and reported that the ore had been exhausted and that it would require large sums of money to open up other ore bodies. Since J. B. Annear, superintendent of the property, took hold the mill has been able to pay for all development work and they are now opening up some good ore bodies. Ores will concentrate and amalgamate. The main tunnel is over 900 feet long and cuts the vein 700 feet below the surface. For some time past they have been running the 10-stamp mill twenty-four hours; best results have been obtained by crushing through a 30-mesh screen; are handling about forty tons per day; working one shift in the mine.

A new ore shoot in the Tambourine G. M. Co. property will be developed. The shaft is down 400 feet. Some of the ore is being shipped to the smelter, but a large percentage is milling ore, and it is the intention of F. B. Tiffany, Colorado Springs, manager of the company, to put up a mill on the property. The mill dirt will average \$10 per ton.

Wallstreet, Sept. 11.

(Special Correspondence).—The Cold Spring M. Co. is lining its shaft from 500 level to 650-foot level with mine rail for the purpose of dropping ore from the 500

to the 650 level, where it is transported to the mill below on Left Hand creek, near Rowena. The mill has been overhauled and new Tetrault tables and jigs installed. As soon as the shaft is completed they will break about fifty tons of ore per day in the mine; main shaft is 900 feet deep. The mill has a capacity of thirty tons per day over four tables and two jigs; water wheel will be installed for operating the plant with water power. T. H. Page is manager.

On Gold Hill the old Slide mine has fifteen men working on ore and shipping five carloads per month. The concentrating ore is being piled up, as the mill which they have operated heretofore is not being run at present. J. A. Owenby of Denver is manager. The company will install new hoisting engine and air drills and development work will be pushed. —The Cash mine is treating its milling ore through the Black Swan mill at Salina. Gold Hill, Sept. 11.

(Special Correspondence).—Near the Slide mine the Maxon G. M. Co. is operating in the old Corning tunnel which is in over 2660 feet. They are running drifts each way from the tunnel and stopping out ore. This tunnel was run to cut the Slide vein and other well-known veins on the line of the tunnel; have some shipping ore, but mostly mill dirt. They are also sinking a shaft 150 feet. The shaft is about 150 feet south of the Slide. R. C. Lamb is superintendent.

The Prussian mill is making a test run on ores using cyanide and roasters. The ore is refractory. If the test run shows up well the plant will be operated steadily.

On Left Hand creek, 2 miles below Rowena and near Glendale, is the 25-stamp mill of the Nugget G. M. & M. Co. About 75% of the values is caught on the plates. All the work of the mine is done through tunnels. At present they are working from the 400-foot level to the surface. One tunnel is 800 feet long. This mine was supposed to have been worked out years ago, but the new management have opened up large bodies of ore and increased the capacity of the mill from ten to twenty-five stamps. They claim to have veins of mill dirt 43 feet wide, mostly low grade free milling; are operating the mill by water power during the summer months, when the water supply is sufficient, and by steam during the winter. It is the intention of the company to install a power plant, water wheels, etc., at the junction of Jim and Left Hand creeks, about 2 miles below the mill. A. Scogland, manager; R. G. Hemingway, mill foreman.

Rowena, Sept. 11.

(Special Correspondence).—At Summer-ville, between Salina and Gold Hill, is the Victoria mine, operated by G. A. Blaisdell, manager for the company. A portion of the property is under lease. The leasers are taking out some good ore. —The Gold Lode is operated by the same party and have just finished sinking to the 400-foot level and are opening up the ore bodies. —In the Crown, under the same management as the above, a contract has been let to upraise from the 200-foot level to the surface. A hoisting engine will be put on as soon as this work is completed.

Near Summerville is the Corona M. Co., L. A. Newell, manager. This company owns seventy acres and are developing the mine by crosscut tunnel which taps the vein 200 feet from the surface. They have 1 mile of underground workings; are getting ready to put in tramway and mill. The mill will be located near the depot at Salina; the tramway will be 1½ mile in length. The vein in this mine is unlike the rest of the veins in the district, being mixed sulphide iron, lead and zinc. From tests made the ore will concentrate readily. During the past ten months the smelting ore which they have been able to sort out has more than paid for the development work in the mine. They are shipping a carload every six weeks. The low-grade ore is stacked up at the mine awaiting the mill. About 20,000 tons of ore is blocked out in the mine that will average \$10.

W. C. Johnson, manager of the Belle M. & M. Co., has sunk an incline shaft 300 feet on the vein. The main tunnel is 1500 feet in length; 250 feet from the entrance of the tunnel is located the hoisting engine; are drifting every 100 feet from the shaft opening up ore. Ore from the lower level is smelting grade that runs from \$150 to \$200 per ton; the ore is tellurium and free gold. They have eight claims and 4500 feet on the lead. The mine is equipped with blacksmith shop, assay office, boiler and hoisting engine. They will erect a mill for handling the ore. On the upper level in the mine they have 15 feet of ore that will run \$12 to \$15. All through the 15 feet there are seams that carry free gold.

Frank Vane, one of the owners of the Little Johnny and Sweet Home group, is taking out high-grade ore. He has a

crosscut tunnel 450 feet in length and about 1800 feet of drift work.

The tunnel on the Elkhorn is in 635 feet; it has already cut several veins, but not the ones they are driving for. The mine is equipped with air compressor and drills. W. B. Smith, manager, states that they are making about 3 feet per day in the tunnel.

Across the creek from the Elkhorn is the Quo Vadis property, operated by I. Moore, manager. The upper tunnel is now 255 feet on the vein. They expect to cut the vein in the lower tunnel in the next 75 to 100 feet. The lower tunnel is in 700 feet; the ore is free gold. The lower tunnel is so situated as to dump the ore direct to the cars on the Colorado & Northwestern Railroad.

Salina, Sept. 11.

#### Chaffee County.

The Roller-Le Fevre mines at Monarch, 20 miles northwest of Salida, have been sold to the Two Republics Co. of Pittsburgh, Pa., for \$200,000. The Roller-Le Fevre mines are on the Monarch branch of the Denver & Rio Grande Railroad, on the middle fork of the South Arkansas river, at the base of Mount Etna and the Iron King mountain. The Roller-Le Fevre mines comprise five groups, or a total of thirty-two claims, and have been developed by 9000 feet of tunnels.

Buena Vista reports say the Tickler tunnel, a lead and zinc mine at St. Elmo, has been sold to H. Rhorer, manager of the Alpha M. & C. Co. of St. Louis, Mo., for \$10,000. D. C. Tobin of White Pine, Colo., is associated with him. They will put men to work and will ship ores of smelting quality. The ore shoot is 5 feet wide. The mine adjoins the Mary Murphy mine, in the Chalk Creek district.

The Mary Murphy mine at Romley, near Buena Vista, has been closed down indefinitely. The mine has 15 miles of workings and a mill has been in operation, says Superintendent Hinkson. The smelter operated by the same company has been closed since a year ago.

#### Clear Creek County.

Idaho Springs reports say the ore shipments for month of August were 203 cars, as against 118 cars for same month last year. Nearly every available mill in the district is running full time, with all the ore capacity engaged ahead. Several properties are closed down for want of milling facilities.

At Empire work has resumed on the Empire Tunnel Co.'s tunnel into Covode mountain after addition of power and enlargement of dam capacity. Of the intended 10,000 feet 3000 have been driven. The tunnel course as surveyed will practically crosscut the entire south end of the mountain in its passage from the creek level below the Neath mine on Covode to the holdings of the company on Silver mountain, comprising, among others, the Gold Dirt and Tenth Legion mines.

The hoisting plant of the Con. Alpine M. Co., 2 miles south of Lamartine, was destroyed by fire last week. The loss was \$5000, insurance \$3000.

The Waldorf M. Co., operating in East and West Argentine districts, near Georgetown, reports Manager Wilcox will install electric power throughout its entire workings.

Ericson & Gilean, leasing in the East Griffith mine, near Georgetown, are shipping ore to the Georgetown sampler, returns averaging \$30 per ton. A cable for electric power has been put in and they will break rock with power drills. They are working at the 2000-foot station of the tunnel level.

H. Haggart, superintendent of the Nickel Plate mine, on Alpine mountain, near Georgetown, is increasing development work. He will start a level farther down the mountain to cut the Dempsey lode. It is said a company will be organized for the development and further equipment of the group.

#### Eagle County.

Red Cliff reports say a strike of sylvanite has been made in the Doddridge lease on the Ground Hog mine, on Battle mountain. The ore, which occurs in a fissure vein in a pyrite-bearing quartz, was found at the 1600-foot level.

#### Fremont County.

The Union mill of the United States R. & R. Co. at Florence will begin running the sampling department on Sept. 20, and on Oct. 1 will resume operation at full capacity. This mill treats only Cripple Creek ores.

#### Gilpin County.

During month of August the shipments of smelting and other ores, concentrates and mill tailings from the Black Hawk depot totaled 253 cars, or 5060 tons. This was in excess of the previous month by 43 cars, or 860 tons.

The air compressor is set up at the mill of the Gregory and Bob Tail M. Co. at Black Hawk and connections made. The compressor weighs thirty-five tons and is to run twenty drills, says Manager O. B.

Thompson and Superintendent W. H. Davis. The Cook shaft has been sunk 500 feet to depth of 1500 feet. About seventy-five men are at work on company, contract and leasing account and this number will be added to.

The Gold Dirt M. Co., operating the Gold Dirt group between Perigo and Gilpin, is shipping smelting ore via Rollinsville to Denver, says Manager W. H. Knowles. The company has leased the Petersen mill, at Gilpin, and are making repairs. This mill is equipped with fifteen slow-drop stamps. It is intended to cyanide the tailings.

The Ingalls G. M. & L. Co. has suspended operations pending installation of a heavier hoisting plant, together with topbuildings and better facilities for handling ore. The shaft is 500 feet deep, and when the larger plant is running the company expects to sink to 1000-foot point. The Ingalls mine is on Gunnell hill, near Central City.

Stroehle & Sons of Black Hawk are putting in a hoist and two boilers at the Roderick Dhu shaft on Quartz hill, and topbuildings are going up. Daily shipments of sixty tons are maintained from the Protection shaft, being milling ore.

The Benzie Investment Co. of Denver has bought the Conqueror group at North Empire, containing 110 acres of patented ground, and W. Ballantyne of Central City is in charge. It is intended to sink a three-compartment vertical shaft. There is a 40-ton concentrating plant which has been remodeled and will be started up.

An air compressor is being put in at the Boston mill of the Gregory & Bottall M. Co. at Black Hawk. The company has sunk 500 feet into Cook shaft, making 1400 feet.

#### Gunnison County.

At White Pine the May-Mazepa and North Star mines report developments progressing. The Akron M. & M. Co., owner, is equipping to economically mine, drain and develop its ore bodies. Near the 4000-foot point of the company's drainage and transportation tunnel payable ore is showing. Silver, gold, lead and zinc are carried. President Dick says a mill will be built at the mouth of the tunnel, equipped to concentrate and separate the zinc-lead values. The mill will be run by water power generated 1 mile below the tunnel's mouth.

#### Lake County.

Leadville reports show the tonnage of the camp for month of August reached 70,000 tons of all classes of ore. Of that amount 8000 tons of zinc, including the crude material and concentrates, were shipped to zinc plants in the United States and to Belgium. The Arkansas valley smelter handled 50,000 tons of the output. Between 300 and 500 more men are at work in the mines than were at the beginning of the year and the number is still increasing.

#### Ouray County.

The Security G. M. Co., owning twenty-seven lode claims and three millsites 4 miles from Ridgway at mouth of Cow creek, reports the experimental work of the small stamp mill has proven the cement deposits to carry values of \$5 per ton in gold. A 100-stamp mill and a cyanide plant to extract gold from tailings will be built. The site for the mill has been chosen and work will be started this week on a road to the mill.

#### Park County.

G. W. Shelton of Alma reports opening the ore shoot in the lower workings of the Kentucky Belle mine. The lower tunnel is 280 feet below the upper workings and at 500 feet in has struck the ore shoot, which shows average values of \$14 per ton. It is a sulphide ore and a concentrating mill will be built. There is ample water supply.

The plant of the South Park Oil, Gas & Coal Co. is drilling for oil in South Park basin on Trout creek, near Hay Ranch station, on the Colorado & Southern Railroad, near Alma.

#### Pitkin County.

Aspen reports say the Newman mine, which has been closed down for the past month to put in a new pipe flume and to repair the old one where no change was to be made, has resumed work. A double-decker skip has also been put in the mine, besides other repairs.

#### Routt County.

A tract of bituminous coal land consisting of 2000 acres has been sold to Morgan & Bivens of Steamboat Springs, with Cedar Rapids, Iowa, men. The tract is 4 miles south of Craig. Development work will be started.

#### San Juan County.

(Special Correspondence).—The pipe line at the Natalie-Occidental group has been completed and a Loeffel water wheel will be placed this week, when two electric drills will be put in and work pushed

until the property is put on a paying basis.

T. Jay Hurley, manager of the Ruby Basin M. Co., is working a large number of men completing the 50-ton mill being erected on the property of the company. Manager Bloodgood of the Big Colorado Co. is building a power and compressor house below the mines where machinery will be installed before winter sets in.

The Venetian M. Co. property is in the hands of the sheriff.—The thirty-nine Willey slimes tables placed in the Gold King mill are ready for the power. A good body of ore has been cut in the Gold Prince, an extension of the Gold King, and a 2-mile tramway will be erected for transporting ore from mine to mill. More prospecting is going on in this section this season than during any previous year and some good ore is being brought in from the outlying districts. O. Hansen is stopping ore from the Idaho mine, owned by Schiffer Bros. The Galta Boy owners are piling up ore preparatory to making a shipment of high grade.

Gladstone, Sept. 11.

Concentrates made by the electro-magnetic process at the Silver Ledge mill, near Silverton, are being shipped at the rate of forty tons a day—zinc as one product and lead as another.

#### San Miguel County.

The contemplated lease of the Smuggler-Union mining and milling property of Telluride to S. D. Nicholson et al. having fallen through, B. Wells, manager of the Smuggler-Union company, has taken a lease on the property and has put on 150 men. This number will be increased until the mines and mills are again working at full capacity.

F. J. Hobbs of Colorado Springs, treasurer of the Butterly-Terrill M. Co., operating at Ophir, says approximately \$10,500 worth of metal was taken from the mine and mill during August. Development shows increasing bodies of concentrating and other ores.

#### Saguache County.

P. R. Harpell, president of the Steel Canyon M. & M. Co., says the concentrator under construction has been delayed owing to the explosion of a boiler. The company has ore blocked out in the mine. Men will be put to work taking out ore. The company has 15,000 tons of ore on the dump, ready for concentrating, and will also build a smelter for the treatment of concentrates.

#### Summit County.

The old Union M. & M. Co., on Mineral hill, near Breckenridge, has cut a station in the Smith shaft at 235 feet, and Superintendent G. C. Smith has a crosscut driven to the vein. The vein is 5 feet. A drift has been started on the vein towards the Montgomery workings. Hoisting at the Montgomery shaft is being done with a horse-power whim. The gallows frame and shaft house have been completed and a hoisting plant similar to that on the Smith shaft will be put in. Manager A. E. Keables has let a contract for driving a double track 1000-foot tunnel from west end of Mineral hill in on the Union vein. He expects to have a concentration mill built.

The Griffith lease on the Jessie group and 40-stamp and concentrating mill, near Breckenridge, will start up the mill this week. It was found necessary to add three more Willey tables to the plant, making twelve in all. To place these tables, an addition to the mill structure was made. A 15-ton air compressor and an extra boiler were also added to the plant. Manager Griffith says air hammer rock drills are being used.

The bedrock of the placer pit of the Gold Pan Placer M. Co. at Breckenridge shows there is a body of partly oxidized iron sulphide ore. It is thought to be one of the upper strata of the ore-bearing blanket veins which underlie the course of the Blue River valley for several miles south and north from Breckenridge. The bedrock of the pit is uncovered 70 feet below the present surface of the Blue River, and as soon as the suction of the hydraulic elevators and of the two centrifugal pumps cease, the pit fills with water to within a few feet of the main floor of the elevated flume.

Twenty additional stamps and four Willey tables are going into the Cashier mill, in Brown's gulch, near Breckenridge. The work will be completed by Oct 1st, and then forty stamps will be dropped.

The Reliance Gold Dredging Co. has started work. The dredger will be built in French gulch, near Breckenridge, east of the Makka mine. To ascertain the depth of washable ground, they will put down a series of drill holes to bedrock, says Manager Smith.

Dewey Bros. have a bond and lease on the Brown-Miller-Langdon group, consisting of three patented claims on Mineral hill, near Breckenridge. Values of the ore are in lead, silver, gold and zinc.

#### Teller County.

At Cripple Creek the Golden Cycle mine, having resumed operations after being closed down for eight months on account of litigation, has 100 men at work. The company is mining seventy-five tons of ore per day of \$40 value in gold per ton. It is expected that the tonnage will be doubled. The ore is being taken from the seven levels of the property.

The Henry Adney mine, on Beacon hill, Cripple Creek, has been sold for \$500,000 to W. Lennox and H. Giddings of Colorado Springs, owners of the Gold King and Strong mines, in the same section. S. McDonald is superintendent.

The flow from the El Paso drainage tunnel at Cripple Creek is 4970 gallons per minute. The El Paso, C. K. & N., Mary McKinney and Elkton mines have had their lower levels unwatered. Nevertheless the tunnel continues to do good work, and especially in the mines higher up than those mentioned. It gives the Bull, Ironclad, Carbonate and Raven hills mines the opportunity to go to greater depths. The primary intent of the tunnel was to drain Beacon and portions of Guyot and Raven hills at a given depth. This has been accomplished and good results to other portions obtained also.

Cripple Creek reports show that production for August reached \$1,790,620, with a tonnage amounting to 61,940. Since the strike was started, August 10th, 1903, the output of the camp has been steadily rising, until now it is practically at the former normal level. The production of August shows an increase over July both in tonnage and valuation. In July 51,700 tons were shipped, having a value of \$1,716,500. With August's figures, the total of the first eight months of 1904 amounts to \$14,028,420. The individual treatments made by mills and smelters for the month were:

Mills	Tons.	Total Value.
Smelters.....	10,000	\$ 600,000
United States R. & R. Co.....	20,000	480,000
Portland mill.....	8,000	256,000
Telluride mill.....	6,000	210,000
Dorcas mill.....	2,800	98,000
Economic mill.....	2,600	88,400
Homestake (cyanide).....	6,510	26,040
Florence (cyanide).....	2,170	13,020
Wild Horse.....	1,850	11,160
Sioux Falls.....	2,000	8,000
Totals.....	61,940	\$1,790,620

For the month of August the Vindicator mine sent out 1500 tons, with values of from two to five ounces; Dillon produced 500 tons, \$30 per ton; the Lonaconing mine, on Beacon hill, 500 tons of \$40 ore; C. K. & N., 1500 tons of \$65 ore; Old Gold, 900 tons of \$40 ore; El Paso, 1200 tons of \$70 ore; W. P. H., 850 tons of \$40 ore; Harrison & Seaver, operating under lease the W. P. E., owned by the United G. M. Co., shipped a total of twenty-eight carloads of ore, returning values of from two to five ounces gold per ton. But little waste is picked out of the ore, and the lessees are breaking ore of 25 feet in width above the 300-foot level. Harrison says they will increase the output this month to double the tonnage made for August.

J. J. Cone, owning the Ophir mine, near Cripple Creek, will build ore bins, five in number, each having capacity of 150 tons. This will permit hoisting ore for two weeks without interruption at any time the weather is bad. The railroad company will extend a spur to the ore bins, so that expense on hauling will be saved.

After being closed down on account of water, H. M. Gilbert has resumed operations on the Longfellow mine on Bull hill, at Victor, and is mining at a depth of 250 feet.—The Gilpin lease on the Jerry Johnson mine on Ironclad hill shipped 350 tons during August, average value \$40. Gilbert has twenty men at work on the lease. Operations at present are confined to the fourth level.

The Elkton Con. at Cripple Creek has 100 men at work. Its new washer and sampling outfit are in operation. The management is confining operations on the bottom or eighth level.

The Kimball Investment Co., operating a lease on the Saturday claim, on Beacon hill, Cripple Creek, has been handicapped on account of surface water, and will put in a 40 H. P. boiler and hoist. The shaft has been sunk 200 feet. It is intended to sink to 700 feet.—The Tunnel M. & L. Co., operating the Abe Lincoln mine of the Stratton estate at Poverty gulch, has started washing the dump and 100 tons of rock are being put through the washer daily, and a regular production of a carload per day is sent out from that source. Besides this, the company is sending out a carload of \$50 ore daily, which is being broken in the 600-foot level, where the vein is 25 feet in width, says Manager Swanson. As soon as the surface water decreases the company will resume sinking the shaft. Another washing machine will be put in.

A lease on the Oro claim, north of the W. P. H. mine, on Ironclad hill, Cripple Creek, has been let to Spencer & Co. of Joplin, Mo., who will install machinery

and sink the shaft 300 feet deeper. On the north end A. Knecht, owner, and H. Hart are sinking a shaft. Work has been done with a windlass. They also will put in machinery.

The samplers of the Cripple Creek district report handling more ore than at any time previous, and the output for the month of October shows farther increase. The Black sampler will handle 6000 tons, while the Eagle will double that amount and the Rio Grande is expected to put through 10,000 tons during the month.

The Gold Coin mine at Cripple Creek, operating leasing system, during August shipped 1500 tons of ore, averaging \$50 per ton. Of the amount the company received \$22,500 net, besides getting a sum for hoisting and sharpening tools. There are thirty-three sets of lessees, employing over 100 men. At one time there were over fifty sets of lessees operating on Gold Coin property, but under the contracts a man must have 2-ounce ore or better to make it pay.

#### IDAHO.

##### Boise County.

At the Mammoth mine on Summit Flat, near Idaho City, forty men are on the pay roll. Buildings are going up and work will start in the incline, to be extended from the 300 to the 400-foot level.

E. E. Rogers of Chicago, Ill., says he will equip the Black Pearl mine at Pearl with a mill and other machinery, including a 1500-foot capacity hoist. The machinery is expected to be ready for operation Dec. 1. Rogers says they are drifting on the Afterthought lead, which is 37 feet wide and runs \$11 per ton. The shaft is down 350 feet and the Afterthought lead will be cut at 390 feet. Two electric motors, of 50 and 75 H. P. each, will be put in. To obviate cessation of work by mishap to the electric power, an 80 H. P. plant, which will run the hoist by compressed air, will be put in. The mill will have 40-mesh screens, and a capacity of 150 tons of ore per day. It will also have four hydraulic classifiers, eight concentrators and four Sperry slimmers. A building will also be put up for an assaying laboratory.

##### Custer County.

G. Z. Edwards of Salt Lake City, Utah, has an option on the Phi Kappa group of six claims in Alto district, 40 miles north of Mackay. Ore carrying silver, lead and copper values has been opened. Development will be started next week and the mine equipped.

Manager Fearn of the White Knob C. Co. at Mackay reports the output of copper bullion from the smelter aggregates 300,000 pounds monthly. The ores treated carry 3% copper in addition to gold and silver values of \$1 to \$2 per ton. The company is treating 450 tons of its own ores daily and 100 tons of custom ores.

##### Idaho County.

The Lucky Lad mine, north of the Big Buffalo mine at Hump, has its shaft down 100 feet, and a test run showed payable values. The company has a 2-stamp mill, a hoist, electric plant and other equipment, and is preparing to put in a 10-stamp mill. The company will also increase development work during the winter.

M. Gilbert of the Buffalo Chief M. Co., operating at Hump, says the Big Buffalo, Crackerjack, Atlas, Jumbo, Mother Lode No. 2 and Buffalo Chief have increased their ore showings during the summer. The Mother Lode No. 2 has shipping ore. The Dice claim has made a strike of free-gold ore. Gilbert says he will place machinery on the Buffalo Chief. The company is also developing placer property in Marshal lake district and has men cutting timber and building a ditch for spring work. Pipe and two giants will be put in.

C. W. Stallings of Grangeville reports 500 men are at work in Thunder mountain mines around Roosevelt. The road from Van Wyck to Roosevelt will be completed this week. The Sunnyside M. Co. has completed the wagon road from the Sunnyside millsite on Marble creek to Roosevelt. The company has completed foundations and buildings for the 40-stamp mill. The Sunnyside Co. is working 250 men. The Dewey Co. is working sixty men. The mill was started up two weeks ago, after being shut down for several months. The H. Y. Co. has its saw-mill completed and the mill is getting out timbers for 20-stamp mill.

##### Shoshone County.

The Stanley M. & M. Co. has been incorporated at Wallace by A. Sutherland as president, F. M. Rose, A. J. Dunn, J. C. McDiarmid and J. L. Dunn. The property consists of four claims near Mullan.

Wallace reports say a consolidation of the Frisco, Bernier and Flynn groups has been made.

Twenty-five hundred men are mining in the Cœur d'Alene district, says the Capital News. About 2200 men are in the larger mines making a monthly payroll of

about \$225,000. In the canyon mines all the underground men receive \$3.50 a day, while at Wardner the wages are \$3.50 to miners and \$3 a day to muckers. The Bunker Hill & Sullivan employs 425 men. The Standard mine and mill of the Federal M. & S. Co. employs 325 men. The Morning mine at Mullan works 265 men in mine and mill, while the Mammoth, the Tiger-Poorman and the Last Chance of the Federal M. & S. Co., employ 200 men each. The Hercules and the Hecla mines at Burke work 136 men each. The following are other properties: Gold Hunter at Mullan 70, Snowstorm at Mullan 40, Sixteen to One at Nine Mile 20, California Con. at Nine Mile 30, Granite at Nine Mile 12, Monarch at Murray 22, Bear Top at Murray 10, Paragon at Murray 10, Golden Chest at Murray 10, Silver King at Government Gulch 10, Black Hawk and Wyoming 10. Several hundred men are working on prospects from one to six men each.

Near Murray, the Monarch Co. is putting in a hoist in the upper works, to sink on the ledge. Manager Spalding has twenty-five men working.

#### Owyhee County.

Cleveland, Ohio, men, with V. Nussbaum as president, have organized a company to take over and develop a group of mines on War Eagle mountain, near Silver City, under charge of N. C. Titus, the group comprising the California, North Extension, Helen and Clara mines. A hoisting plant and other machinery will be put in and a shaft will be sunk. Titus says work will be begun this month.

A. I. Eagle and G. A. Bergh of Nampa are putting in a 5-stamp mill and other equipment for their group of three claims on Sucker creek, 13 miles north of Silver City. A 7-foot vein of free-milling ore has been opened, showing value of \$8. It is intended to save the tailings from the mill with view of putting in a cyanide plant later.

#### Washington County.

The smelting plant built by the Ladd Metals Co. at Lenore, in the Seven Devils copper district, will be blown in this week, says C. E. Ladd, president. C. M. McDowell is manager. The plant is of seventy-five tons capacity.

### MICHIGAN.

#### Houghton County.

As a result of discoveries made in the past few weeks both the Isle Royale and the Atlantic mines, near Houghton, are said to be improved. With the Isle Royale the advantage is derived from sinking a new shaft on Section 11, at southern end of the company's lands, where a showing of copper has been opened, says the Daily Record. The Superior C. Co., recently organized to develop a mine on Section 11, between the Isle Royale and Baltic mines, has struck what is thought to be the northern extension of the Baltic lode, sought, unsuccessfully, by the Atlantic Co., on Section 16, for several years. Both of these developments benefit the Atlantic mine.

### MISSOURI.

#### Jasper County.

At Webb City, an electrically operated mill has been completed on the McCorkle Hill lease.—The Fullerton M. Co., L. M. Janes, superintendent, has built a mill at the Hand Shaft on the American-Cornfield lease.—The mill of the Chicago L. & Z. Co., L. E. Sanford superintendent, is having a larger air compressor put in.—The Wise M. Co., R. Jarred superintendent, has opened a 10-foot face of ore on the South Missouri Zinc Fields ground, and will put in hand jigs and begin cleaning ore.

The Cushing-Webb City O. & M. Co., of Oklahoma, will make improvements on its mining leases in Webb City district. J. M. Kerr has management of the company's mine on the Acme lease. They will build a mill on the lease.

The Majestic M. Co., which owns fifteen mines in the Webb City-Cartersville district, has leases on 120 of the Baker land and eighty acres of the Carter land and will erect buildings and put in pumps.

#### Lawrence County.

More men have been put into the Julia West mine, at Stotts City, and the mill started, says Superintendent Stephens.—The Illini mine and mill are in operation. Superintendent Hamilton is shipping ore.

### MONTANA.

#### Fergus County.

Work is being carried on with diamond drills on the Waldorf-Draper group, near the Kendall mine at Kendall. The Draper is owned by the South Moccasin M. Co.

#### Flathead County.

T. A. Noble, of Pittsburgh, Pa., president of the Rustler M. Co. operating the Snowshoe mine, at Libby, says the new machinery put in the mill is working satisfactorily. It is intended to sink to

the 1000-foot level, for which heavier machinery will be put in. Noble says during the time in which the shaft is being sunk the mill will be kept running.

#### Lewis and Clarke County.

The Montana M. Co. reports at the Drumlunnon mine at Marysville, during July thirty-five stamps dropped twenty-eight days, crushing 1750 tons of ore, producing bullion bars and concentrates valued at \$11,100; the tailings plant was employed for thirty-one days, treating 12,975 tons of tailings and fines, producing cyanide precipitates of \$26,000 value; total (represented by 1440 ounces of gold and 15,970 ounces of silver), \$37,100. Expenditures: General maintenance and milling, \$7500; payments to leasers, \$3400; extraneous expenses (insurance, etc.), \$1500; legal expenses, \$800—\$13,200. Treatment of 12,975 tons of tailings and fines, \$14,700; insurance, \$500—\$15,200. Total, \$28,400. Estimated profit, \$8700. The expenditure of \$3000 incurred in developing properties under option is not included in the figures.

#### Silver Bow County.

The Pennsylvania mine, owned by the Boston & Montana Co. at Butte, is again in full operation. With exception of the timbering force, the men had been idle five weeks on account of repairs in the shaft. During suspension 400 feet of the shaft between the surface and the 500-foot stations were retimbered.

### NEVADA.

#### Elko County.

E. L. Godbe says he will build a furnace at Bullionville (Panaca P. O.), 16 miles from Caliente, and will smelt ore from the Jackrabbit mine and the tailings at Bullionville.

E. R. Abadie of San Francisco, Cal., has bought the Kewanee Nos. 1 and 2 mines, near Columbia, near Elko, for \$25,000 and first payment is made. Development will be resumed.

#### Esmeralda County.

E. L. Mims & Co. have an option on the J. Butler interests at Goldfield, including his interests in the Sandstorm Co. and Columbia Mountain Co., Rabbit Springs water right and Columbia Townsite Co.

#### Lincoln County.

The mill of the Newport-Nevada M. Co. at Fay is closed down temporarily for repairs.

F. Campbell, with G. W. Way, has an option on the April Fool group of gold-silver claims, north of Los Vegas, near Caliente, and have put men to work. They have also a lease and bond on the Bob Lee gold-copper group, 12 miles east of the April Fool, on which group is a supply of water from the Cool springs.

The Salt Lake Route Ex. Co. has been incorporated by H. Joseph et al. of Salt Lake City, Utah, to develop mineral-bearing territory in the section being tapped by the San Pedro Railroad. The ledges include copper and gold, silver and lead and cinnabar, the latter having been acquired in a bond on the properties of A. E. Thomas at Goode Springs. Most of the company's holdings are in Lincoln county, with Goode Springs the base of operations.

#### Nye County.

The Nevada M. Co. mines at Berlin are again in full operation and the mill is running. More men are being put to work.

B. Kadish and F. S. Lack of Baker City, Or., propose to build sampling works at Tonopah and have bought a site for the plant.

The compressor plant at the Tonopah Extension mine at Tonopah is in operation. The plant comprises two boilers, one of 125 H. P., which has been connected with the old 50 H. P. boiler for hoisting from the shaft and driving the compressor, the latter having capacity of 1225 cubic feet per minute, and will operate six 3-inch drills at that altitude. More drills will be put into the mine. The entire plant, including freight and installation, has cost \$10,000. The Tonopah Extension is under the management of J. McKane, and has 1800 feet of underground workings. The main shaft has been sunk to 500 feet, and sinking will be resumed.

#### White Pine County.

The experimental concentration plant at the Ruth mine is in operation by the White Pine C. Co., preliminary to building reduction works for development of its copper mines. The plant consists of one Huntington mill, one Wilfley concentrating table, two Frue vanners and two Johnson concentrators. The water supply for the mill is pumped from the Copper Flat mines, a distance of 1½ miles.

### NEW MEXICO.

#### Lincoln County.

The mill on the Puritan mine in the White mountains, near Lincoln, owned by the Jerry Simpson M. Co., is completed. A steam pump is being put in to handle the water in the mine.

#### Otero County.

The Amarillo M. Co. will resume development work at Jarilla (Brice). Three whims are being worked at Jarilla.

#### Socorro County.

There being sufficient water again, work has been resumed by the Cooney mill at Cooney. The Last Chance mine is in ore. B. Graham reports making a strike on the Peterson & Lambert group on the Whitewater creek.

### OREGON.

#### Baker County.

Manager E. S. Tice of the Single Standard Co., at Baker City, says he will reopen the mine and start development. A 10-stamp mill, concentrators, water power machinery and an electric plant are included in the plant to be put in.

W. M. Kippen of Spokane, Wash., and N. P. Kaylor of Sumpter have bonded the Buckeye group in Cracker creek section. They are taking out ore for shipment to the smelter. Development will be increased.

With twelve men, development is progressing at the Platts group near Sumpter. The drift on the Jim Blaine vein is opening up ore 30 feet wide, of which 8 feet is milling value. Manager Hendryx says a compressor is being put in.

#### Grant County.

Manager J. P. McGuigan of the Alamo mine at Granite says he will put men on development and start up the mill. In addition he will build a 30-ton cyanide plant.

Two feet of ore, running \$20 per ton, is being treated at the Royal White stamp mill and development is in progress on the drift on the cross-vein. The group comprises three claims near Alamo, on which surface work has proved two parallel veins. The shaft will be continued down. It is intended to go farther down the mountain and drive a crosscut tunnel, which will give backs of 400 feet. J. P. McGuigan is manager.

The 10-stamp mill at the May Queen mine, near Granite, is again in operation, after idleness of four years. Superintendent W. T. Young has been developing the lower level of the property and has blocked out milling ore. The May Queen is north of the Red Boy.—The Big Producer Co., whose mine is in Alamo district near the Van Anda and Oro Fino properties, has resumed development work.

#### Jackson County.

F. Perry of New York and J. F. Reddy of Spokane, Wash., have bought an interest in the Opp mines, west of Jacksonville, and they will install a 10-stamp mill.

#### Josephine County.

The Lucky Queen M. Co., near Merlin, has bought half a section of timber land on Jack's creek, near the mine, and is putting up a sawmill. The company will build a 10-stamp quartz mill on Jump-Off-Joe creek, ½ mile below the mine. The ore will be hauled to the mill by a gravity railroad.—The Oro Fino mine, in the same section, is putting in a 50-ton cyanide plant.

Men are driving development work on the Alameda mine at Galice, says Manager J. F. Wickham. Work is under way on two adits and in a crosscut. Work will be started on an opening between the two levels. The company will build roads that will give shorter mileage to the railroad, and which will make Leland its shipping point. It will also afford a direct route for hauling in mill machinery.

The dredger of A. Champlain, on Fooths creek, near Grant's Pass, has resumed work after two weeks, overhauling and repairing for the winter.

The Albright & Co. quartz mines near Kerby have been bonded to T. F. Hopkins & Co. for \$20,000, who will develop and equip them. The ore is low grade. Hopkins & Co. will begin work this week and will later put in a stamp mill.

#### Lane County.

At Blue River the Cuba M. Co. has a group of eight claims near the Lucky Boy mine. Several veins have been opened. The company controls a supply of water for milling purposes, and a mill-site, above which a tunnel can be driven to cut the veins at depth. The company will increase development work.—At the Lucky Boy mine work is suspended during the installation of a cyanide plant.—At the Uncle Sam mine the mill being built is expected to be ready to crush ore this week.—At the Badger mine a tunnel is being driven to cut the veins at depth. A mill-site has been selected below the mouth of the tunnel.

A 5-stamp mill will be built on the Mayflower quartz mining property near Bohemia by the Mayflower M. Co., consisting of W. P. Ely of Castle Rock, Wash., E. Carlson of Kalama, Wash., and M. Reed and J. A. Beck of Portland. The company has been doing development work on its group for several years past and has run 2000 feet of tunnel.

### SOUTH DAKOTA.

#### Custer County.

Buildings have been put up on the mine of the Addie M. Co. on Crow creek, 8 miles west of Custer, and a working shaft has been started. It will sink on the vein and drifts will be driven. The ore is 18 inches thick.

#### Lawrence County.

The management of the Deadwood-Standard M. Co., operating west of Lead, reports the mill will be in operation again by October 1. A churn drill will be used to determine extent of the ore bodies. Holes will be put down to depth of 500 to 600 feet.

The run at the cyanide mill of the Spearfish G. M. & R. Co., near Spearfish, during month of August handled 8000 tons, being an increase of 2000 tons over the previous month.

It is reported the Amicus mill (Highland) of the Homestake M. Co. at Lead will be increased by sixty additional stamps, making 300 in that mill. T. J. Grier is superintendent.

#### Pennington County.

The Golden West M. Co., operating southwest of Rochford, has bought the Nancy Hanks group of claims which adjoins the Golden West on the east. A 15-foot vein of free-milling ore has been opened. The Golden West Co. is installing a plant with Huntington mills.

### UTAH.

#### Beaver County.

W. B. Mucklow of Hartford, Conn., president of the Majestic C. Co., reports work is progressing on the O. K., Old Hickory and Harrington & Hickory mines of the company at Milford under Superintendent Freudenenthal. The result of work at the mines makes it certain, says Mucklow, that the furnaces of the company's smelter near Milford will be blown in again before Jan. 1. Construction of a concentrating mill for treatment of the silver-lead ores of the Harrington and Hickory mines, of which there are large bodies exposed, is also proposed. For transportation it is proposed to build an aerial tramway, the distance from mine to plant near the smelter being 4 miles. The elevation of the main Harrington and Hickory works is 450 feet above the smelter.

#### Box Elder County.

The Bonneville Oil & Asphaltum Co., of which S. Bamberger of Salt Lake City is president, with J. S. Gordon, E. B. Critchlow, E. A. Vail, G. Frary, G. Payne, H. M. McCartney, M. J. West, T. E. Black, U. V. Withee, J. and J. J. Simpson and T. Hull directors, has been incorporated to develop placer mining claims and to extract oil, asphaltum and other hydrocarbons. The company owns the Eva, New Century, Industrial, Big Muddy and Old Original Con. placer claims in Box Elder county. It is sinking a well on its ground, with prospects of striking oil.

The Santa Maria G. & C. M. & R. Co. of Ogden has been incorporated by D. Maguire, president, C. A. Maguire, et al. The company owns a group of claims in Sierra Madre district.

#### Grand County.

W. R. Wheat, manager of the Grouse Mountain M. Co., is increasing work on the Grouse Mountain tunnel at Basin, in the La Sal mountains. Next month he will start work on the erection of a 100-ton cyanide mill.

#### Iron County.

Modena reports say the Newport & Nevada mill, pending blocking out of ore and repairs, is closed.

#### Utah County.

W. J. Stauffenberg and J. P. Pederson are resuming development work on the New Utah group of mining claims in Ericson district, near Eureka. The property has been developed by an incline shaft, but it is intended to put up a hoist, blacksmith shop and other buildings, and sink a vertical shaft to tap the vein at a depth of 200 feet.

After a run on Gemini mine ore a clean-up has been made at the Eureka Hill mill at Eureka, and the plant will be closed down indefinitely, says the Eureka Reporter. There are eight carloads of concentrates at the mill awaiting shipment and 80,000 ounces of bullion.

W. F. Babcock of Salt Lake City, manager of the New York Giant Co.'s Deep creek mines, near Fish Springs, is starting development of a group of claims adjoining the Lucy L. company's property on the south.

The mines of Tintic district shipped 404 carloads of ore and concentrates during August: The Centennial-Eureka, 172 carloads, Gemini 64, Mammoth 41, Uncle Sam Con. 14 of concentrates and 9 of ore, Bullion-Beck, Grand Central and Yankee Con. 22 carloads each, Carisa 12, Eagle & Blue Bell 8, Ajax 8, Tero 6, South Swansea 6, Victor Con. 5, Eureka Hill Mill (concentrates) 4, Star Con. 3, Salvador 2,

Lower Mammoth I, Laclede I, Monterey I and Anderson (lease) I.

Salt Lake County.

With four furnaces in operation the Bingham Con. smelter at Bingham is handling a daily average of 750 tons of ore, from which 35,000 pounds of gold and silver-bearing copper bullion are derived. Another furnace will be blown in this month, increasing capacity of the plant to 900 tons per day.

The Old Evergreen M. Co., operating near Alta, in Big Cottonwood canyon, has made application to the State for use of certain sources of water to supply power with which to operate a concentrator, also drills underground. The management of the Evergreen reports having developed a tonnage of milling ore.

The Little Cottonwood M. Co. has been organized in Salt Lake City. The properties of the company are near Alta, in the Little Cottonwood mining district. The officers are: R. Knudsen, P. Blinn, E. P. Phelps and C. F. Loofbourou.

Summit County.

The Ontario mill at Park City will be put in operation again. The water has been bailed out of the mine down to the 1700-foot level and the pumps are working. By means of two tanks, from 1200 to 1300 gallons of water per minute were taken from the mine. The hoisting works replacing those burned down are under roof, with the exception of the gallowes frame and shaft, which are to be left uncovered. The compressor at the mine is being overhauled. An ore bin will be built, from which the cars will be loaded for shipment.

At the Daly-West mine at Park City the 80-foot gallowes-frame is completed. Contractor Graham built and set the frame in a month's time. The first three sets of timber in the shaft have been replaced with heavier timbers, made necessary by the new head frame requiring firmer foundation. Skips will replace the cages in the shaft and will hold five tons each. An ore bin will be built at mouth of shaft. The ore house built to replace the one which collapsed is completed and full of ore.

Tooele County.

The Climax M. & M. Co. has been organized in Salt Lake City. The properties of the company are in Erickson mining district. The officers are: T. Rownd, president; J. J. Mason, manager, and W. D. Mathis.

The mill of the Northern Light M. Co. on Lion hill, near Mercur, has been sold to J. M. Swem.

Since putting in the Chilean regrounding mill, the Honerine mill at Stockton is making average of 100 tons of concentrates and high-grade ore daily. During month of August thirty-five cars of concentrates were shipped from the Honerine mill. The water having decreased, work has been resumed in the Honerine drainage tunnel. The flow of water is giving 7000 gallons a minute, says Superintendent Kaddatz.

It is understood Manager J. J. Trenam of the Stockton G. M. & M. Co. at Stockton will build a mill to handle the mine's second-grade ore.—The Galena King, Black Diamond and others are being developed.

Uinta County.

H. Sanger, manager of the Uinta C. Co. at Vernal, says he will blow in the smelter again.

Utah County.

M. P. Braffet of Scofield and Salt Lake City men are doing development work on a vein of ozocerite or mineral wax, at Colton. A 12-foot vein, running 5% to 7% parafine, with two veins of ozocerite 5 and 7 inches, respectively, in thickness, comprise the find. A plant for extracting the wax from the vein matter will be built at a cost of \$30,000, says Braffet. It is said a product worth \$200 per ton at the mine can be produced by a simple process of reduction. Fuel, both wood and coal, for boiling the product out of the crushed rock, is convenient and cheap.

WASHINGTON.

Ferry County.

J. L. Harper of Republic, S. Aughey et al., who have bought the Manila mine, near Keller, will increase development. It is said a railroad will be built into that section and a smelter installed at West Fork, on the San Poil river, 15 miles south of Republic. The mine is at an elevation of 1000 feet above the valley of the San Poil, along which the railroad will run. This will enable the product of the mine to be handled by an aerial tramway. Water power can be obtained from the river.

Okanogan County.

C. C. May of Davenport, treasurer of the Palmer Mountain G. M. & T. Co. of Loomis, says work will be increased. The Palmer Mountain Co. owns fifty claims, also water power of sufficient volume to operate the works of the company

and furnish a surplus for use of neighboring mines. The property is equipped with machinery for development, including air drills and a compressed air and electrical plant. A double-track tunnel has been driven for 4000 feet, cutting thirty gold-bearing ledges. Depth attained by the tunnel is 1000 feet vertical. Grading for a reduction plant is in progress. The mill will have a capacity of 300 tons daily. A power plant will also be built on Toat's Coulee creek, which is owned by the company. The principal owners are C. C. May and F. H. Luce of Davenport, N. F. Essig and D. Drumbeller of Spokane and Eastern men. Palmer mountain is in northern Okanogan county, near the Canadian border. The Copper World M. Co. owns claims across the mountain from the tunnel company. Cutting through the mountain at that place is a copper-bearing dyke. The company proposes to extend the Palmer mountain tunnel through the mountain to its ground.

Stevens County.

In Deer Trail camp, at the head of Cedar canyon, A. W. Turner and H. J. Davis of Davenport have machinery for a 100-ton smelter on the ground and have forty men putting up buildings. They expect to have it running Oct. 15th. By blowing out a furnace they can treat galena when a sufficient quantity is available to run thirty days, says Assistant Manager C. E. Davis. The principal ore treated will be copper, carrying gold and silver. The smelter is built primarily to treat ores from the two leads in the Turk group. The group is in the main Cedar canyon, 1½ mile from the smelter. There are thirty-five men at work at the mine. Twenty teams will be put to work hauling ore. Coal will be brought from Davenport, 35 miles distant, by a traction engine capable of drawing four trucks loaded with twenty-five tons. The haul will be ten hours. The road has been prepared.

WYOMING.

Carbon County.

Encampment reports say a gold strike has been made in the Solo mine of the Jack Pot group of claims near Copperton, near Encampment. The vein fills the shaft, and a mill run of ore from all parts of the vein at the point where Battle creek crosses it gives \$50 a ton in gold. The ore is free milling.

Converse County.

The Copper King T. & M. Co. has let a contract for driving a tunnel on the Copper King claim, War Bonnet district, for \$12 per foot. It is expected the crosscut will tap the vein at a depth of 225 feet from the surface. This mine is 1½ mile from the Oriole mine, near Douglas.

FOREIGN.

AFRICA.

Transvaal.

The Transvaal Chamber of Mines at Johannesburg reports the gold output for month of July at 298,825 ounces for the Witwatersrand (a decrease of 1088 ounces compared with June), and 9015 ounces for the outside districts (an increase of 709 ounces compared with June).

AUSTRALIA.

Queensland.

Brisbane reports say the Queensland gold returns for July were:

District.	Tons Crushed.	Yield in Ounces.
Charters Towers.....	21,700	21,700
Croydon.....	6,000	3,300
Gympie.....	15,800	8,700
Mount Morgan.....	21,200	9,100
Ravenswood.....	3,100	4,600
Other Fields.....	3,800	2,900
A luvial.....	.....	1,400
Total.....	71,800	51,700

Victoria.

The gold yield of Victoria for the first seven months of 1904 is given at 460,168 ounces, being an increase over last year's production of 19,597 ounces.

Western Australia.

The gold production of Western Australia for 1904 to August 1st is reported at:

Month.	Total Ounces.
January.....	211,373
February.....	194,321
March.....	163,729
April.....	206,574
May.....	191,732
June.....	200,357
July.....	192,306
The total for twelve months of 1903 was	2,436,311 ounces.

BRITISH COLUMBIA.

The Byron N. White Co., owner of the Slocan Star group at Sandon, reports having paid to date \$375,000 in dividends. Pay ore has been opened to vertical depth of 800 feet, carrying ruby silver and grey copper. The zinc ledges also carry them. The Star has been working steadily with sixty men. It is sending out weekly 165 tons. The concentrator was overhauled

last winter. A feature of the remodeling was the change of vanners with Willey for saving of slimes. The concentrator is turning out twelve tons of silver-lead and twenty tons of zinc concentrates daily. The former is shipped to Trail and the latter is piling up outside the mill. Over 2000 tons of zinc are on hand waiting magnetic separation, when the zinc-enriching plants are erected.

Boundary District.

J. C. Welch, manager of the Montreal & Boston C. Co. smelter, at Boundary Falls, says the smelter will blow in its two furnaces about October 1. The ore will be largely drawn from the Brooklyn, Stemwinder, Rawhide and other properties at Phoenix. The third furnace will be set up as soon as smelting commences, and a fourth furnace will be bought in the spring.

East Kootenay District.

At Kimberley operations will be resumed at the Sullivan mine as soon as the roasters at the company's smelter, under construction at Marysville, are completed. Contracts have been let for cutting a tramway from the Sullivan mine to the railway at Kimberley.

The survey of the coal areas of the Imperial C. & C. Co., at Fording River, near Fernie, are being completed. Manager J. Brown is increasing prospecting work, and reports working on several veins. Coal of quality for coking or steaming is being mined in course of development work.

Nelson District.

The Shiloh mine, ½ mile from Ymir, on the Dundee road, will resume operations next month.

The Hunter V. mine has increased shipments to 100 tons a day. During August operations were changed from the glory hole on the Hunter V. claim to that on the Double Standard. The mine can put out 400 tons per day, which is the maximum which can be handled by the tramway.

A. W. Boyd of Spokane, Wash., is resuming operations on the placer property owned by the Erie Placer M. Co., 3 miles north of Erie, on the north fork of Salmon river. It is intended to put in a hydraulic plant.

Rossland District.

M. R. Galusha, manager of the Jumbo mine at Rossland, says the mine is shipping fifty tons of ore a day to the smelter, and next month he expects to increase the shipments to 100 tons a day. The company is working twenty men.

Slocan District.

B. White and J. G. Davlin, of Nelson, interested in the Slocan Star and Molly Gibson mines, near Sandon, report a company has been formed to operate the Molly Gibson, and men are being sent into the mine, which is 12 miles from Kootenay lake on Kokanee creek. The government will rebuild the wagon road to the Molly Gibson.

Vancouver Island.

(Special Correspondence).—The Tye Copper Co., Ltd., at Duncan Station, reports smelter returns for August were: Smelter ran twenty-three days; 4587 tons of Tye ore smelted, giving a return after deduction of freight and refining charges of \$59,224.

Duncans Station, Sept. 10.

West Kootenay District.

On the Bad Shot mine a lease and bond have been given to Vipond, McLean, Mills & McLellan. Development work will be resumed. The mine is in the Lardeau section, near Camborne.—Four hundred tons of salt are at the warehouses along the lake front for use in the concentration plant at Five Mile.—J. A. Darragh has applied for 300 inches of water to be taken from Mohawk creek, to be used for mining and milling purposes at the Silver Dollar group.

IND'IA.

The total output of the gold mines of India for month of July was 51,283 ounces as compared with 51,606 ounces for June, and 50,571 ounces for July, 1903.

JAPAN.

K. Takenouchi, manager of the Kasaka M. & S. Co., says they are operating properties at Rikichu. The ores mined are principally copper bearing, but carry values in silver and gold. Improvements will be made in mining and smelting methods.

MEXICO.

Chihuahua.

The Guggenheim Exploration Co. has started work on the San Pedro copper properties in Tepezala camp.

A placer gold field is reported found in Guaynopa canyon, near Casas Grandes. A large number of prospectors, many of them Americans, have staked out claims. One prospector from Casas Grandes is said to have taken out \$17,000 worth of gold from his claim in five days.

Coahuila.

The Sierra Mojada camp is reported producing 8500 tons of ore per month, divided among the mines as follows: American S. & R. Co., 1050 tons; Compania Metallurgica Mexicana, 1200 tons; Constancia M. Co., 1350 tons; Esperanza M. Co., 800 tons; Fronteriza M. Co., 50 tons; other shippers, 500 tons.

H. G. Collins of Las Esperanzas, with E. Gonzales, is prospecting for coal with diamond drills in the Sabinas valley, State of Coahuila.

Jalisco.

La Fortuna M. Co.'s 10-ton amalgamating plant is in full operation under management of F. E. Lloyd. The plant is at Ahualulco, and consists of stamp mill, copper plates, etc.

Sonora.

Ore has been opened up at the San Bernardino mine, 14 miles southeast of Cananea, assays showing 125 ounces silver, 12% copper and a trace of gold. McDonald & O'Brien of Cananea are the owners, and they expect to put more men to work.

J. B. Tomlinson of Prescott, Ariz., with Boston, Mass., men, put in \$125,000 worth of machinery at the Swansea mine, 65 miles southeast of Cananea. A 200-ton concentrating mill will be the principal part of the equipment.

Near Sahuaripa the Cieneguita C. Co. is putting in a 200-ton reverberatory furnace, says T. S. Lewis of Denver, Colo., treasurer of the company.

Tamaulipas.

It is reported the gusher of the Mexican Petroleum Co. at Ebano continues flowing about 1600 barrels of oil a day. Work is being rushed on five 35,000-barrel steel storage tanks, and when these are completed the other wells will be sunk to the oil-bearing strata.

NEW ZEALAND.

The New Zealand gold output for month of July is reported at 48,013 ounces, valued at £180,027, as compared with 55,902 ounces, valued at £216,578 for July, 1903.

Commercial Paragraphs.

THE Risdon Iron Works of San Francisco, Cal., is shipping this month to the Philippine M. Co., via Manila, a standard Risdon dredge, with 34-foot buckets, having a capacity of 200 cubic yards daily.

THE Pelton Water Wheel Co. report five orders last month from Java, to be used in developing power for quarries, coffee, tea and other industries. The company states that over 11,000 wheels are now in operation, with an aggregate maximum capacity of 1,125,000 H. P. They will send free on request their illustrated book, containing valuable hydraulic data, by addressing the Pelton Water Wheel Co., 124 Main St., San Francisco; 147 Liberty St., New York.

A COMPANY has been organized and incorporated under the laws of California, and known as the Vencedora Mine Equipment Co., to experimentally investigate and test newly devised and patented mining and metallurgical machinery and processes, with a view to placing plants on mining properties for interests in the same, and otherwise putting on the market their machines or processes, on which the company has already acquired several patents. The organizers of the company are W. C. Ralston, A. G. Fisk, Charles Hirschfeld, H. T. Creswell and Jos. Spiers of San Francisco, Cal.

Trade Treatises.

"Wire Rope Tramways" in an excellent description of the several styles of aerial wire rope tramways made by A. Leschen & Sons Rope Co., 920 North First street, St. Louis, Mo. The company's branch offices are 163 Washington street, New York; 137 East Lake street, Chicago; 1717 Arapahoe street, Denver, and Rialto Building, San Francisco. A request to any of these offices will secure a copy.

"Electrically Driven Machinery," being Bulletin 101 from Harron, Rickard & McCone, 21-23 Fremont street, San Francisco, Cal., is a treatise of standard size (6x9 inches), which commends and describes modes of electrical power application, air compressors, mine hoists, pumping machinery, blowers, ventilators, etc., with finely illustrated description of each device, with prices. This booklet is worthy of a place on any mining engineer's desk.

## Personal.

G. K. ORR is superintendent of the Lundquist mine, near Auburn, Cal.

C. W. PURINGTON is at Nome, Alaska, and will return to Denver, Colo., October 15.

W. L. WATTS, E. M., of Los Angeles, Cal., is in Oaxaca, Mex., on professional business.

F. SUSTERSIC is manager of the Amparo M. Co., operating at Etzatlán, Jalisco, Mex.

S. McDONALD is superintendent of the Henry Adney mine, on Beacon Hill, Cripple Creek, Colo.

A. W. BOYD of Spokane, Wash., is in charge of the placer mines of the Erie P. M. Co. at Erie, B. C.

F. D. JOHNSON has resigned as manager of the Ivanhoe Junction mine at Kalgoorlie, Western Australia.

G. D. BLOOD is chief engineer for the United States & Nicaragua M. Co. at Yauli, Segovia, Nicaragua.

A. S. MILLS is superintendent of the Oriental group of copper mines at Cave Creek, Maricopa county, Ariz.

E. H. LIVEING is resident consulting engineer for the Associated M. Co. at Kalgoorlie, Western Australia.

J. WAGNER has resigned as superintendent of the Bonnie Bee M. Co., at Dutch Flat, Placer county, Cal.

W. H. BUNCE is chief engineer of the American M. Co., operating near Port Delrick, Cape Gracias, Nicaragua.

E. McCORMICK of Calumet, Mich., has returned there from an examination of placer mines in Colombia, South America.

O. H. FAIRCHILD of Denver, Colo., is remodeling the Marion-Geyser mill at Mercur, Utah, for New York capitalists.

J. J. MACDONALD is consulting engineer for the Seal of Gold M. Co., operating mines at Dale, San Bernardino county, Cal.

H. H. NICHOLSON at Sumpter, Or., is consulting engineer for the Morning G. M. Co., operating in the Greenhorn mountains.

W. W. GARRETT has been appointed professor of chemistry and metallurgy in the Missouri School of Mines at Columbia, Missouri.

A. F. RISING, recently of Madoc, Ontario, has accepted a position with the San Carlos C. M. Co. at Linares, Nuevo Leon, Mex.

G. J. LYON, C. E., has been appointed on the faculty of the civil engineering department of the University of Colorado at Boulder, Colo.

A. W. CONNER has accepted appointment as assistant professor of civil engineering in the Missouri School of Mines at Columbia, Mo.

W. BALLANTYNE of Central City, Colo., is manager of the Conqueror group of mines at North Empire, Gilpin county, near Central City.

H. SANGER, formerly in charge of the Uinta C. Co., is again manager of the company's mines and smelter at Vernal, Uinta county, Utah.

E. WALSER, formerly cyanide operator for the Dorcas mill, Florence, Colo., is metallurgist for the Montana Zinc Co. at Walkerville, Mont.

J. W. HOWARD, consulting, civil and mining engineer, has been appointed on the international jury of awards at the St. Louis Exposition.

H. COLVIN has resigned as superintendent of the Bamberger-De Lamar mill at De Lamar, Nev., to accept a place with the Utah C. Co. at Bingham, Utah.

H. M. DAVEY has severed his connection with LeRoi C. Co. Northport, Wash., smelter and has gone to Marysville, B. C., to build furnaces for a smelter there.

W. G. RAYMOND of Rennselaer Polytechnic Institute has been appointed head of the engineering department of the Iowa State University at Ames, Iowa.

V. B. SHERROD has resigned as manager of the Nuevo Australia & Nuevo Porvenir mines at Guanacavi, Durango, Mex., and will go to Guanajuato, Mex.

J. C. BARBER, recently with the Homestake M. Co. at Lead, South Dakota, has accepted position as superintendent of a mining company, operating at Ketchikan, Alaska.

G. D. DOVETON, after an absence of sixteen months, being engaged profes-

sionally by Creston Colorado Co. of Torres, Sonora, Mexico, has returned to Denver, Colo.

G. C. MASON, for twelve years past on the engineering faculty of New York University, New York City, has opened an office as consulting engineer at Portland, Oregon.

C. G. HYDE, C. E., engaged in engineering work at Pittsburgh, Pa., has been appointed assistant professor of sanitary engineering in the University of California at Berkeley, Cal.

G. M. FORD of Auburn, Cal., has gone to Korea to accept the position of superintendent of construction for the Oriental Con. M. Co., operating near Puk Chin, in Wunsan province.

T. P. RIGNEY of Salt Lake City, Utah, has retired from management of the Summit mineral wax mines at Soldier Summit, Utah, and will give his attention to personal interests.

SUPERINTENDENT T. H. SIMMONDS of the Bunker Hill & Sullivan mine at Wardner, Idaho, has gone to California, to be absent several months, and Foreman W. McDougal will act as superintendent.

G. G. LINDSEY of Toronto, Canada, third vice-president of the Crow's Nest Pass Coal Co., operating at Fernie, Michel and Morrissey, B. C., has been appointed general manager of the company's mines.

K. TAKENOUCHI, manager of the Kasaka M. & S. Co., operating copper mines at Rikichu, Japan, is examining smelting methods as practiced in Utah and Montana. He will visit Australian plants before returning to Japan.

MANAGING DIRECTOR A. J. McMILLAN has been appointed manager and J. W. Astley general superintendent of the Le Roi C. Co. at Roseland, B. C. A. I. Goodell is manager of the company's smelter at Northport, Wash.

R. BRONDEL, recently superintendent of the San Pedro copper mines at Tepetzala, Chihuahua, Mex., has been transferred by the Guggenheim Exploration Co. to the Descubridora mine at Durango, Mex.

H. W. REYNOLDS, for the past four years with the mechanical engineering department of the Michigan Agricultural College, has been appointed assistant professor of mechanical engineering in the University of California at Berkeley, Cal.

## Obituary.

WESLEY HUNTER, a pioneer mining man of Colorado, died at Idaho Springs, Colo., on the 8th inst., at the age of 68 years.

J. MITCHELL, a mining man of Idaho Springs, Colo., died on the 6th inst. Deceased was born in England forty-nine years ago.

H. N. MARTIN, superintendent of the San Marcial coal mines in Sonora, Mex., was killed in a raid by Yaqui Indians on a La Barranca stage last week.

FRITZ MILLER, a British Columbia mining man known as the discoverer of the Atlin, B. C., mining camp, died at Atlin on the 2nd inst. Deceased was a native of Germany about thirty years of age. He was one of the earliest of the Northern prospectors, going into the Yukon when fifteen years of age. Later he staked the first claim on Pine creek at Atlin.

P. MCCANN, a mining man of Colorado, died at Central City, Colo., on the 10th inst. Deceased was 59 years of age. He went to Colorado in 1886 and had been identified with mining and milling in Gilpin and Clear Creek counties most of the time since then. In the '80s he was milling in California gulch near Leadville. He was superintendent of the mines operated by the Kansas Burrows Con. M. Co. of Gilpin county.

## Books Received.

"Oil Engines" is the title of a profusely illustrated and practical treatise on the design and construction of oil engines by A. H. Goldingham, M. E. (second edition enlarged). The work treats on a large number of oil engines and their application to various uses, such as running dynamos, compressors, pumps and many other kinds of machinery. It contains instructions for running and repairing oil engines, and also numerous tables useful in making comparisons and computations. Price, cloth, \$2. Spon & Chamberlain, 123 Liberty street, New York.

## Latest Market Reports.

SAN FRANCISCO, September 16, 1904.

### METALS.

SILVER.—Per oz., Troy: London, 26 $\frac{1}{2}$ d (standard ounce, 925 fine); New York, bar silver, 56 $\frac{1}{2}$ c, refined (1000 fine); San Francisco, 56 $\frac{1}{2}$ c; Mexican dollars, 47c San Francisco, 45 $\frac{1}{2}$ c New York.

COPPER.—New York: Standard, \$12.75; Lake, 1 to 3 casks, \$12.75; Electrolytic, 1 to 3 casks, \$12.75; Casting, 1 to 3 casks, \$12.50; San Francisco: \$15.00. Mill copper plates, \$17.00; bars, 18@24c. London: \$57 5s spot per ton.

Copper remains almost unchanged, the small fractional changes being the result of a steady market and production. From present indications no material change need be anticipated during the next three months.

Following are the figures of the German consumption of foreign copper for the months January-July, 1904, as compared with the same period of time in 1903-1902:

	1904.	1903.	1902.
Import, tons.....	64,334	49,263	47,765
Export, tons.....	4,514	6,283	5,517

Consumption, tons. 59,520 42,980 42,248

LEAD.—New York, \$4.30; Salt Lake City, \$3.50; St. Louis, \$4.12 $\frac{1}{2}$ ; San Francisco, \$4.50, carload lots; 4 $\frac{1}{2}$ c 1000 to 4000 lbs.; pipe 6 $\frac{1}{2}$ , sheet 7, bar 5 $\frac{1}{2}$ c; pig, \$4.85. London: £11 16s 3d long ton.

SPELTER.—New York, \$5.20; St. Louis, \$5.00; London, £22 10s  $\frac{1}{2}$  ton; San Francisco, ton lots, 6 $\frac{1}{2}$ c; 100-lb. lots, 7c.

TIN.—New York, pig, \$27.42 $\frac{1}{2}$ @27.62 $\frac{1}{2}$ ; San Francisco, ton lots, 28c; 500 lbs., 28 $\frac{1}{2}$ c; 200 lbs., 29c; less, 29 $\frac{1}{2}$ c; bar tin,  $\frac{1}{2}$  lb., 30@32 $\frac{1}{2}$ c. London, £126 2s 6d spot.

PLATINUM.—San Francisco, crude, \$18.50  $\frac{1}{2}$  oz.; New York, ingot, \$19.00  $\frac{1}{2}$  Troy oz. Platinum ware, 75 @ 82c  $\frac{1}{2}$  gram.

QUICKSILVER.—New York, \$42.00@44.00, large lots; London, £7 15s San Francisco, coil, \$41.50@42.50  $\frac{1}{2}$  flask of 75 lbs.; Denver, \$45.00. Export, \$41.50@42.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6 $\frac{1}{2}$ c; extra, 17 $\frac{1}{2}$ c; genuine, 31 $\frac{1}{2}$ c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 17.75c; San Francisco, Plumbers', 100-lb. lots, 15.25c.

ZINC.—Metallic, chemically pure,  $\frac{1}{2}$  lb., 50c; dust,  $\frac{1}{2}$  lb., 10c; sulphate,  $\frac{1}{2}$  lb., .04c.

NICKEL.—New York, 40@47c  $\frac{1}{2}$  lb.; ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 31@34c.

### STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$12.85 @13.20; gray forge, \$12.00; San Francisco, bar, 3c  $\frac{1}{2}$  lb., 3 $\frac{1}{2}$ c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$23.00@23.00; open hearth billets, \$23.00 @23.00; San Francisco, bar, 7c to 12c  $\frac{1}{2}$  lb.

### GENERAL SUPPLIES.

ANTIMONY.—New York, Cookson's, 7 $\frac{1}{2}$ c; Hallett's, 6 $\frac{1}{2}$ c; San Francisco, 1000-lb. lots, 8c; 300/500-lbs., 8 $\frac{1}{2}$ c; 100-lb. lots, 10 $\frac{1}{2}$ c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15 $\frac{1}{2}$ c; less than one ton, 17 $\frac{1}{2}$ c. No. 1\*, 60%, carload lots, 13 $\frac{1}{2}$ c; less than one ton, 15 $\frac{1}{2}$ c. No. 1\*\* 50%, carload lots, 11 $\frac{1}{2}$ c; less than one ton, 13 $\frac{1}{2}$ c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9 $\frac{1}{2}$ c; less than one ton, 11 $\frac{1}{2}$ c. No. 2\*\* 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2.00 per keg.

CAPS.—3x, \$5.50@6 per 1000; 4x, \$6.50 @7; 5x, \$8@8.50; Lion, \$9@9.50, in lots not less than 1000.

FUSE.—Triple tape, \$4.00 per 1000 feet; double tape, \$3.50; single tape, \$3.10; Hemp, \$2.75; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11 $\frac{1}{2}$ c  $\frac{1}{2}$  set; 14 oz., 40s., 10c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 23@24c  $\frac{1}{2}$  lb.; carloads, 23@23 $\frac{1}{2}$ c; in tins, 30c; soda ash, \$2.00  $\frac{1}{2}$  100 lbs.; hyposulphite of soda, 3@3 $\frac{1}{2}$ c per lb.; caustic soda, in drums, 3@3 $\frac{1}{2}$ c  $\frac{1}{2}$  lb.; Cal. s. soda, bbls., \$1.20@1.40  $\frac{1}{2}$  100 lbs.; sks., \$1.05; chlorate of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2 $\frac{1}{2}$ @2 $\frac{1}{2}$ c; powdered sulphur, 2@3c; flour sulphur, French, 3 $\frac{1}{2}$ @3 $\frac{1}{2}$ c; alum, \$2.00@2.25; California refined, 1 $\frac{1}{2}$ @2c; sulphide of iron, 8c  $\frac{1}{2}$  lb.; copper sulphate, 5 $\frac{1}{2}$ @5 $\frac{1}{2}$ c; chloride of lime, spot, \$2.50@2.75; sulphuric acid, in carboys, 66 $\frac{1}{2}$  B, 1 $\frac{1}{2}$ @2c  $\frac{1}{2}$  lb.; nitric acid, carboys, 8c  $\frac{1}{2}$  lb.

OILS.—Linseed, boiled, bbl., 57c; cs., 62c; raw, bbl., 55c; cs., 60c; Lucol oil boiled, bbl., 50c; cs., 55c; raw, bbl., 48c; cs., 53c. Kerosene—Pearl, per gal., 19 $\frac{1}{2}$ c; Astral, 19 $\frac{1}{2}$ c; Star, 19 $\frac{1}{2}$ c; Extra Star, 24c; Ecocene, 23c; Elaine, 26c; Water White, in bulk, 13c; Mineral Seal, iron bbls., 18c; wooden bbls., 20 $\frac{1}{2}$ c; cs., 24c; Mineral Spermin, cs., 26 $\frac{1}{2}$ c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22 $\frac{1}{2}$ c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 13c; do., in cs., 19 $\frac{1}{2}$ c; Lard Oil, E. W. S., bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Spermin, crude, 63@68c; Natural White, 63c; Bleached, do., 57c; Whale Oil, cs., 52@57c.

ALUMINUM.—No. 1, 99%, small lots, 37c  $\frac{1}{2}$  lb., 100 lbs., 35c; 1000 lbs., 34c; ton lots and over, 33c; Pittsburg, No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

BORAX.—Concentrated, 6@7c  $\frac{1}{2}$  lb.; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

BONE ASH.—Extra No. 1, 5@6c  $\frac{1}{2}$  lb., No. 1, 4@5c.

RED LEAD.—500 lbs. and over at one purchase,  $\frac{1}{2}$  lb., 7c; less than 500 lbs., 7 $\frac{1}{2}$ c.

LITHARGE.—Pure, in 25-lb. bags, 8@9c  $\frac{1}{2}$  lb.

MOLYBDENUM.—Best, \$2.00  $\frac{1}{2}$  lb.

CHROMIUM.—90% and over,  $\frac{1}{2}$  lb., 80c.

PHOSPHORUS.—American,  $\frac{1}{2}$  lb., 70c.

SILVER.—Chloride,  $\frac{1}{2}$  oz., 90c@1.00; nitrate, 55c.

MERCURY.—Bichloride,  $\frac{1}{2}$  lb., 77c.

MAGNESIUM.—Pure, N. Y., 60c.

MANGANESE.—Metal,  $\frac{1}{2}$  lb., \$2.75.

SODIUM.—Metal,  $\frac{1}{2}$  lb., 50c.

BISMUTH.—Subnitrate,  $\frac{1}{2}$  lb., \$2.10.

URANIUM.—Oxide,  $\frac{1}{2}$  lb., \$3.50.

FIRE BRICK.—Domestic, carloads per 1000, f. o. b., factory square, \$25.00; soap and split, \$22.50; arch and wedge, \$27.50; skewback, \$30.00; circle, \$32.00.

FIRE CLAY.—Domestic, per ton 2000 lbs. in 125-lb. bags, double, and dry ground, f. o. b., factory, \$8.50.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

ROCK DRILL.—No. 769, 465. Sept. 6, 1904. W.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

COMPOSING STICK TILTER.—No. 769,443. Sept. 6, 1904. S. Lack, Berkeley, Cal. This invention relates to improvements in typesetters' tools and particularly in means for supporting a composing stick in inclined position. The object of the invention is to provide a simple device to be carried by the stick capable of being folded out of the way when not in use, but being instantly at hand and easily applicable when needed.

## The Difficulties of Concentration.

The object of concentration of ores is to collect the values occurring in a large mass of rock into a smaller mass, thus enriching it in proportion to the amount of concentration. By concentrating 6 into 1, or 20 into 1, is meant the collecting of all—or as much as possible—of the values in six tons of ore into one ton, or that in twenty tons into one ton. The subject of concentration is one which has engaged the attention of a large number of practical and scientific men, who have worked along lines often widely different, but with greater or less success. There are a great many concentrating devices and an almost equally great variety of the several types. There are bumping tables, shaking tables, buddies and inclined planes, stationary and moving; there are a dozen or more makes of belt concentrators having particular kinds and variable degrees of motion. There are jigs, of several kinds, with their accessory machinery. Spitzkasten and spitzluten are concentrating devices, and beside these there is a great variety of hydraulic classifiers, all depending for their operation upon the same principles. A smelter is necessarily a concentrator, for it reduces the valuable metallic contents of an ore to a lesser bulk and sometimes weight, often only a small percentage of the original volume of ore, while containing practically all of the values.

There is a large and very important difference in the facility with which various minerals concentrate, and to this difference is due most of the difficulties of concentration and probably the large number of different kinds of concentrating devices. Probably the least troublesome material to concentrate is pyrite from a clean quartz gangue. Chalcopyrite is less easy of concentration, owing to its inferior hardness and consequent tendency to slime. Galena, although softer than chalcopyrite, does not slime so readily, owing to its higher specific gravity and largely to the cubic habit of its crystallization, which may be detected in the finest particles of the mineral when examined under the microscope. All other soft sulphide and telluride ores slime more or less upon crushing, and as it is not uncommon to find several different kinds of sulphide minerals in a single ore, and the gangue may consist of several varieties of earthy mineral, such as quartz, calcite, heavy spar, etc. These complex ores render the separation of the valuable sulphides from the gangue often a difficult matter. The relative size of the particles of the several sulphides present, as well as of the gangue,

El Rico Mill, Mother Lode, California. (See Page 210.)

Hauling Timbers to the Mines. (See Page 210.)

Assay Office of El Rico Mine, Mother Lode, California. (See Page 210.)

is an important factor in concentration, and, in view of this, the method of crushing any particular ore should be carefully studied before a plant is installed. It may be said that, with a few rare exceptions, complete or satisfactory concentration of an ore can not be effected by a single operation. The ore must be crushed to a fineness which will free the valuable particles of the ore from the matrix, and this may be accomplished in stages—first coarse crushing, with a separation of the coarser fragments of valuable mineral, usually on jigs, followed by screening and recrushing of the lighter portion rejected by the coarse concentrating machines, for the purpose of further freeing the mineral from the gangue. Hydraulic classifying, to effect classification of sized ore particles,

is also an important factor in concentrating, and renders the subsequent operations on tables, belt machines and other devices much easier of accomplishment. There is too often a tendency to perform the entire concentration at a single operation on one machine. This in many cases is an impossibility; still the practice continues. One of the secrets of successful concentration is in avoiding the sliming of the material as far as possible, and when slimes result from mechanical crushing to remove them by classifiers from the remainder of the pulp, that each class may be treated separately, in a proper manner and each on a concentrating device suited to the character of material.

It is generally understood that all ores are adaptable to concentration by the smelting method, when mixed with suitable fluxes, but often this method is impracticable for various mechanical, physical, or economical reasons, and concentration by hydraulic method on the various devices above referred to is the natural consequence. For many years the art of ore dressing has been carefully studied and practiced in Europe, but for a long time, for commercial reasons, some of the methods employed there were deemed unapplicable to conditions in America. Now, however, adaptations and variations of the European methods have been adopted and in some instances American ingenuity has resulted in the devising of means to affect separations which were scarcely attempted in Europe. The electro-magnetic separator is a device which is of recent date, but is a pronounced success. It has rendered the separation of zincblende from its associated ores and gangue minerals possible when other mechanical means failed. Contemporaneously with this the "salt cake" process, for separating zinc from other sulphides was successfully introduced in New South Wales.

## Broken Hill Report.

The half yearly report of the Broken Hill Proprietary Co. of New South Wales for the half year ending May 30, 1904, has been received and presents some interesting figures, and also indicates the wisdom of the policy which directs the operations of that large concern. As an instance may be mentioned the statement that the cost of development for the half year was \$115,000; equivalent to 36 cents per ton of ore raised. Included in this item was the cost of sinking the Delprat shaft to 1020 feet. This indicates a policy of carrying on development contemporaneously with ore extraction—one of the most important details of mining practice. The Broken Hill is now in its twentieth year, but this half yearly report shows that the tonnage produced exceeded by 5000 tons that of any similar period in its history, which again indicates the wisdom of a policy of carrying development so far in advance of extraction as to make this increasingly greater output possible. The tonnage produced was 305,512, of which all but 7194 tons consisted of concentrating ore.

A plant has been erected to manufacture sulphuric acid as a by-product from ore-roasting furnaces. Among other improvements, a plant has been installed for the purpose of separating zincblende from the complex ore of this mine by what is known as the Delprat "salt-cake" process, an invention of the manager. Each pan employed in the process treats 100 tons in twenty-four hours, the total capacity of the Broken Hill plant being 2000 tons weekly. This process is said to effect, in a wet way, results similar to those of the electro-magnetic separator. The history of Broken Hill has been a very interesting one. Originally the oxidized ores were high-grade lead ores, high in silver, with a large percentage of manganese oxide—typical smelting ores. The ores now mined are low grade, complex and difficult to treat. Concentration of sulphides, roasting of slimes and

separation of zinc are some of the manipulations through which these ores pass before smelting. The mine has paid over \$40,000,000 in dividends and it is still largely profitable.

## The Mining Law.

There appears to be a disposition to make radical changes in the existing Federal mining laws. That this may be done to advantage is believed by many, but in the contemplation of any changes in the laws such proposed alterations should be carefully considered, for ill-advised changes can only result in greater confusion and increased, instead of lessened, litigation. It must also be remembered that all mining claims located prior to any change will continue to exist under the laws obtaining at the time of location of such claims. The extralateral right is the most prominent cause of disturbance, and in this the relation of the end lines of a claim to the dip of the vein is an important factor. As long, however, as locators are permitted to lay out their claims in haphazard fashion, with the end lines at other than right angles with the side lines, and with no particular reference to the strike or dip of the vein, there may be expected the legal complications which have constantly arisen during the past years.

If the extralateral right is abolished in favor of square locations, or of those of any other definite form or size, then the first requirement of the mining law—the discovery of mineral in place—must also be abolished in order that the locator may acquire by location sufficient territory adjacent to his outcrop in the direction of the dip to justify him in erecting the large and expensive plant often essential to the economical development and operation of the property on a scale commensurate with its magnitude. This condition has been appreciated in Mexico, where not even a discovery is required, but the would-be locator who wishes to avail himself of the opportunity presented by the Government of acquiring undeveloped mining property simply makes his selection, which is viewed by a Government official. He may then take as many claims (pertenencias) as he wishes and pays an annual tax on the concession. He may or may not do development work, as he elects, but his title remains good as long as he keeps up his taxes. In Mexico, as elsewhere, the locator should be sure that the officially written description of his claim coincides with the boundaries of the claim on the ground—in other words, make sure he is getting the ground he selects; but this is a matter of detail. In the United States it is rarely the case that a recorder of a mining district visits a claim he is requested to record, before entering the same on his official books. The writer knows of but one recorder who made this his invariable rule, and he positively refused to make such entry until he had made a personal inspection and satisfied himself that the claim presented for record did not conflict with any other. There is no mining litigation of record in his district. In the contemplation of a change in the existing mining laws it would be well, perhaps, to give the above instance more than a passing thought. In a district where the recorder prevents encroachment of claims upon each other much litigation is avoided.

THE Congo Free State, in Equatorial Africa, has passed a law which forbids the use of any mining product, as prepared at the place of extraction, for payments, gifts, exchange, or any commercial transaction. Any person not being a concessionaire of a mine, or authorized by a concessionaire, found in possession of precious metals produced from mines in the Congo Free State, or engaged in conveying such metals, renders himself liable to imprisonment. This statute is aimed at those who systematically steal gold specimens, diamonds and other valuable mineral products, and those who buy them from the purloiners. The law was doubtless suggested by similar laws in South Africa. In the United States there are abundant laws making theft of any kind punishable, but it would be inexpedient, if not impossible, to pass and enforce a law making it a misdemeanor to have valuable minerals of any kind in one's possession, unless such person were the owner or operator of a mine. Yet there are some districts where the strictest vigilance is necessary to prevent misappropriation of specimens.

## The Drainage Tunnel in Mining.

There is no factor in the economics of mining more important than the inexpensive handling of underground water. In some mines it is an expense exceeding all others, and in still other mines the volume of water is so great as to render profitable mining impossible. Wherever there are great quantities of water to handle, and the cost of drainage is excessive, it is good business to run a tunnel for the purpose of handling the water by gravity instead of mechanically. The tunnel, once driven and properly timbered, is no longer a source of expense, but a means of economy in the operation of the mine. In addition to this, it affords a means of ventilation superior to any other, and also a comparatively inexpensive means of transportation of ores and materials from and into the mine. There are many districts where tunnels are either inexpedient or impossible, owing to the topography of the country, and still other places where drainage by tunnel will solve the water problem, but its advantages are either unappreciated or the mine owners cannot agree upon a concerted plan of action and equitable division of expense.

The driving of long tunnels by private enterprise, for drainage and transportation purposes, on a basis of contracts previously secured, has met with some unfortunate experiences, and capitalists are slow to appreciate the rather uncertain advantages to themselves in undertaking enterprises of this character. The greatest drainage tunnel in the United States is the Sutro tunnel draining the Comstock lode at Virginia City to a depth of about 1750 feet. Only those who have stood on the bank of the Carson river east of the mouth of the Sutro tunnel, and looked up at the great mountains of trachyte which lay between him and the outcrop of the lode at Virginia City, can understand what a gigantic undertaking the financing of such an enterprise at such a time was. The work was undertaken and continued to a successful issue, but it was a constant hard fought battle—an unequal war between the determination and courage of a few men and physical, financial and legal obstacles. The main tunnel is a little over 20,000 feet in length, and the lateral branches along the lode about as much more. Without doubt were it not for the Sutro tunnel the Comstock would have been deserted years ago. This is, as has been said, the most noted mine drain tunnel in America, if not in the world, but there are other great tunnels, the advantages of which are fully appreciated by those who have benefited by their existence. In the early history of the Ontario mine, at Park City, Utah, a drainage tunnel was run which relieved that mine to the 600 level of a large and constantly increasing volume of water. Later a second tunnel was started, to drain the mine to the 1500 level. This tunnel is now in 17,000 feet, has cost over \$600,000 and is to be driven 3000 feet more into and through the Daly-West ground, which will give this tunnel a total length almost equalling the main Sutro tunnel, and all done by private enterprise. In the Cœur d'Alene district of Idaho, the Bunker Hill & Sullivan Co. have driven a drainage and transportation tunnel 12,000 feet in length, and it has resulted in greatly cheapening the cost of mining at that property. The Yak tunnel at Leadville, Colo., is in about 12,000 feet, and is one of the most important features in that district, both from an engineering and economic point of view. At Cripple Creek, Colo., the drainage adit, known as the El Paso tunnel, has proven of inestimable value to the development of mining in that district, and a lower and longer tunnel is now being seriously considered to render accessible the deeper ore bodies of that district. In the Bingham district of Utah the Dalton & Lark tunnel, known as the Mascot, is in over 6000 feet, and the Honerine tunnel at Stockton, Utah, is in 6000 feet and being driven to 7000 feet. In Colorado there are numerous instances of the great benefit derived from drainage tunnels, among them that at Creede, which drained the mines on Bachelor mountain. Beside the above there are numerous other drainage adits in mines elsewhere, and in one instance, at least, that of the mines at Clausthal, Germany, a drainage tunnel is provided with gates and boats are floated into and from the mine and used for transporting ore and materials.

## CONCENTRATES.

WATER PIPE is usually tested to 300 pounds pressure per square inch before delivery.

THERE is more friction on the face of a wooden pulley than on that of a cast iron pulley.

GENERALLY speaking, about 7.5 gallons of water per horse power per hour are required for steam making in boilers.

THE water-jacketed melting furnace is not a "new" institution. It is mentioned in Overman's Metallurgy as being in use over fifty years ago.

WHERE slipping occurs on the brakes of hoisting engines, oil or grease is not recommended. Chalk aids the brakes to hold and is not injurious.

THE metric gram weighs 15.432+ grains. The legal value of the gram in the United States is 15.432 grains. A new 5-cent nickel weighs 5 grams.

ANY heavy piece of iron that affords a secure rest for the end of a drill will do for swaging machine drills, but no substitute is as convenient as the notched sole plate made for this purpose.

THE volume of a cone-shaped tank may be ascertained by the following formula, from Trautwine: Volume =  $\frac{1}{3} \times \text{perpendicular height} \times (\text{area of top} + \text{area of base} + \sqrt{\text{area of top} \times \text{area of base}})$ .

WHERE A locates a placer claim, whether he may know of the existence of a quartz lode therein or not, B may not enter A's claim to prospect for a vein or to locate one should he know of such, as he would be a trespasser on A's claim.

BLOW HOLES in iron castings may be filled with a mixture one part gum arabic, one part plaster of Paris and one part iron filings mixed with a little water. This, when dry, becomes hard and the hole will be scarcely noticed if properly filled.

AS URANIUM and other radio-active minerals become better known to prospectors, it may be anticipated that they will be found in many places where not at present suspected. Uranium ores occur in several localities in the Black Hills of South Dakota.

A SINGLE diamond drill hole is likely to give misleading information. Prospecting with the diamond drill may be carried on to great advantage if it be done systematically, but holes sunk at random, with no care as to the record of results, is of little value.

WHEN the ventilation becomes poor in the mine and no connection can be made with other workings which will afford natural ventilation, it is time to increase the size of the ventilating fan if it is running to its capacity. It may be necessary to provide more power also, but this should not stand in the way.

WHEN the drills can no longer be tempered the steel has probably been overheated and the carbon burned out. The ends should be cut off 3 or 4 inches from each drill and new bits forged on them, then in the future avoid too high heat in the forge. The overheating was probably done in heating to forge, and not to temper.

KUNZITE is a transparent lilac-colored spodumene, a lithia-bearing aluminous silicate. Its discovery is of comparatively recent date. It occurs in pegmatite together with other lithia-bearing minerals, notably lepidolite and amblygonite. It is used as a gem stone, and its value is determined, as in other gems, by its purity, freedom from flaw and its size.

A QUICK and convenient method of ascertaining the tonnage of solution in a tank is to calculate the tonnage of the tank when full. Divide this into feet and inches in height. A measuring pole should be made by painting a foot and inch scale on it, marking the tonnage. Then by immersing the measuring pole in the solution the depth in feet and inches will at once tell the amount of solution in tons in the tank.

CONCENTRATES said to contain \$150 to \$200 per ton, the greater part of the values being in silver sulphide (argentite), are treated at the Woodstock mine in New Zealand by the cyanide process, by the agitation method. The concentrates are agitated for thirty-six hours with a 4% cyanide solution. Two pounds of lime are added for every ton of concentrates. The charge treated is usually  $1\frac{1}{2}$  ton. The actual recovery is stated to be 90% to 94%, at a cost of about \$4.50 per ton for materials and labor.

THE ton according to the United States Statutes is 2240 pounds or twenty hundredweight of 112 pounds each. This is called the long or gross ton. The ton of 2000 pounds is called the short or net ton. The bloom ton contains 2464 pounds + two hundredweight of 112 pounds each; and the pig iron ton had 2268 pounds or

2240 pounds + twenty-eight pounds "sandage" to each "quarter," allowing for the sand adhering to the pigs of iron. In electric traction and hoisting the ton contemplated 2000 pounds.

BUT two sections in the United States produced lithium materials in 1903—Pala, San Diego county, Cal., and the Etta and Bob Ingersoll mines, in the Black Hills, S. D. The minerals mined were lepidolite and spodumene (both silicates) and amblygonite (lithium phosphate). The Pala lepidolite carries about 5% lithium oxide and amblygonite from Pala 8.3%. Spodumene is obtained principally from the Etta mine, in the Black Hills. The production of lithium minerals for 1903 was 1155 tons, valued at \$23,425 at the railroad. The uses of lithium are limited, being mostly for medicines.

WHERE several persons hold a mining location in common and the annual assessment work is left undone, one of these co-owners cannot re-locate the claim as against his former partners. One of them may perform the assessment work to the extent required by law, thus saving the claim for all, and he may then demand from the several co-owners their share of the expense. Then, if refused, he may proceed to "advertise out" his partners in the manner prescribed by law, but he may not re-locate in his own name, as against the others, any more than he can profit by his own negligence by a re-location alone and fail to perform the necessary work.

WHEN sinking was discontinued at the Combination shaft of the Savage, Hale & Norcross mines on the Comstock lode of Nevada, it had reached a vertical depth of 3250 feet. This was March 28, 1882. It was at that time the deepest shaft in the world with the single exception of that on the Adelbert mine, Bohemia, which was down 3280 feet. Since that time a number of shafts have been sunk to greater depth, notably in the Lake Superior region. The Combination shaft above mentioned is one of the few deep vertical shafts still open on the Comstock. The Yellow Jacket and Foreman shafts, both deep vertical openings sunk at the cost of several millions each, are caved and probably will never be reopened.

COMMERCIAL ASBESTOS is mainly of two varieties, chrysotile and amphibole, the applications of the latter being limited to where a very short fiber or a ground product is used. The uses of asbestos are numerous and constantly increasing, a few being fire screens, partitions, ceilings, stove linings, pipe coverings, electrical insulation, cloth, theater curtains, gloves for furnace-men, glass workers' shovels and baking screens, fire-proof paints, and packing for fireproof safes. When asbestos is used for electrical insulation, in case of short-circuiting the "burnout" is confined to one channel and one wire. Canada is the largest producer of asbestos, most of the output going to the United States. In 1903 Canada produced 42,328 tons, value \$904,852. The United States in 1903 produced 887 tons, value \$16,760.

THE usual method of computing the capacity of an air compressor is to multiply the sectional area of the intake cylinder in feet by twice the length of stroke of the piston, in feet, and this product by the number of revolutions per minute at which the machine may be run. This will give a rough approximation of the capacity of the compressor, and is based on the assumption that the piston is double acting, and gives the result of the number of cubic feet of free air per minute—deduction being made for the volume of the piston rod. To obtain the actual capacity of the compressor, however, requires a careful test, which may be best made with the use of indicator cards. The number of atmospheres for a final pressure is determined approximately by adding fifteen pounds to the gauge pressure and dividing by fifteen.

THE business of a company organized under the laws of the State of Colorado, or Territory of Arizona, or other foreign State or Territory, and doing business in the State of California, is conducted in accordance with the laws of the State in which it is incorporated. If the stock is non-assessable, as in Arizona, it is non-assessable in California; but no stock is non-assessable of corporations organized under the laws of California, no matter what directors or others may promise. However, the stockholders of all corporations operating in California, and organized under the laws of a foreign State, are subject to the personal liability of stockholders provided for in the corporation laws of California, it being the evident intention of the law not to give the stockholders of foreign corporations an unfair advantage over corporations organized in California.

TO give amalgamated mill plates a final cleaning at the end of a run, the amalgam may be softened by covering the plates with gunny sacks and then pouring over them scalding hot water for several minutes. Or a quantity of sand may be heated and piled on the plates. The heat softens the amalgam and greatly facilitates its removal from the plates with steel scrapers. Good scrapers may be made from old flat mill files. In using them care should be taken that the silver plating is not removed as well as the amalgam. This "sweating" of plates, as it is called, should be only done when it is intended to hang up the mill for an indefinite period. The weekly or monthly practice of sweating is not to be recommended, as it not only takes time and hard labor, but it removes what is most desirable in a plate for sub-

sequent amalgamation, that is a film of gold amalgam on the plate. No surface is superior or equal to that of gold amalgam for catching more gold. Most mill men in their eagerness to make a good cleanup overlook this important point and scrape the plates too close.

THERE is no limit to the number of mining claims a locator may take for himself or for others. Placer claims cannot exceed twenty acres in area, but an individual may take as many twenty-acre claims as he can find unappropriated, and an association of eight or more persons can take not to exceed 160 acres in a single claim. They may take as many claims of 160 acres each as they desire. On each tract of twenty acres the individual locator must perform \$100 worth of work annually, but the association of persons need perform only \$100 worth of work on each claim of 160 acres. Where there is a group of quartz locations, these several locations cannot be considered a single claim, on which \$100 worth of work will suffice, as is the case with the 160-acre placer claim, but \$100 worth of work must be annually performed on or for each claim 1500x600 feet or less.

A STEEL CORE in a hoisting rope adds from 7% to 10% to its strength, but it is customary to insert a hempen core in ropes used for hoisting, as this greatly lessens the wear, due to bending of the rope over sheaves and drums. Where high speeds are employed it is advisable to have sheaves and drums of large size. The standard rope is made of six strands, each formed by twisting nineteen wires together about the hemp or steel wire center. Inferior steel ropes are not as serviceable as those of good iron. When the wires composing a strand and the several strands are twisted in the same direction it is known as a "lang" rope. Where great flexibility in a rope is desired it is customary to make the several strands of wire ropes which are made of twisted wires, as in the case of tiller ropes. No great flexibility is required in standing ropes like those on which buckets are drawn by a hauling wire on aerial trams.

IT is known that dilute cyanide solutions have a direct effect on many sulphides. Experiments have shown that chalcocite, when finely crushed and treated with a 0.03% solution, will within an hour yield a portion of the copper to the solution. Copper glance acts in much the same manner, copper being present in the solution in the form of cyanide. Covellite, a sub-sulphide of copper, is attacked even more readily than the sulphides, a sulphocyanide of copper. The carbonates and oxides of copper are attacked freely. Stibnite (antimony sulphide) is affected by cyanide and is one of the most objectionable of minerals in cyanide treatment. Some chemists assert that, if first treated with a solution of sodium sulphide, the antimony will be dissolved and carried away in the wash water. A part of the sulphur of stibnite has a tendency to combine with the potassium of the potassium cyanide, forming sulphide of potassium, the remainder of the sulphur forming, with the cyanogen, sulphocyanogen. Galena (lead sulphide) is attacked slowly by cyanide solutions, but its sulphur forms sulphocyanogen; zinc blende is not materially affected, but the experiment of placing a strip of bright silver among the ore showed that decomposition takes place, as the silver was blackened. Pyrite is scarcely, if at all, affected by cyanide solutions.

IN a few mills, mostly in Australia, gold is precipitated from cyanide solutions in filters of charcoal. In some plants the charcoal—finely granulated—is packed in barrels and in others it is placed in hopper-shaped boxes. James' "Cyanide Practice" says: "One hundred and forty-four tubs are required to precipitate 400 gallons of solution per hour, so that at a plant of 800 or 1000 tons a day capacity, 2000 regulation tubs and no less than forty regulation furnaces for burning the charcoal would be required, and the ash remaining at each cleanup would weigh ten tons, containing, say, 1% gold. The fusion of a large quantity of light ash would not only require large amounts of flux, but would probably be attended with considerable loss of gold." It is probably due to the above mentioned difficulties that charcoal precipitation is not in more extended use. At Mount Morgan, Queensland, Australia, where the ores are treated by chlorination, precipitation of gold from the solutions is successfully effected by means of charcoal filters of pyramidal shape, made of wood and lined with sheet lead. These hoppers, sixty-four in number, each contain a layer of charcoal 2 feet 6 inches deep, placed on a perforated board covered with cheese cloth, and kept from floating by a perforated sheet of lead. Before being placed in the filters the charcoal is crushed to pieces about one-sixteenth of an inch in diameter, and the fine dust rejected. The solution introduced at the top percolates through the charcoal, depositing the gold in a finely divided condition, on the surface and in the pores of the charcoal. Occasionally some gold escapes in the solution and this is delivered to a filter of sawdust where the further precipitation of gold is completed. At these works numerous methods of precipitation were tried and each rejected in favor of the charcoal. Among other things experimented with were sulphate of iron which was discontinued because the spent liquor was not available for reuse, and because of the large area of precipitating tanks required; sulphurous acid and sulphureted hydrogen also were rejected, as a slight excess remaining in the spent liquor would precipitate gold in the leaching vats; and sulphide of iron was rejected because of the formation of ferrous sulphate.

## The Desert Dry Lakes of California.

NUMBER V.

Written for the MINING AND SCIENTIFIC PRESS by  
G. E. BAILEY, E. M.

The importance of the California deposits is only emphasized and increased when compared to the world's production of borax, which is shown by the following table taken from Bulletin No. 24:

GENERAL PRODUCTION OF BORAX.  
(Metric tons).

Year.	United States	Chili	India	Germany	Italy	Peru	Turkey.
	Calcium Borate.	Calcium Borate.	Borax.	Boracite.	Boric Acid.	Calcium Borate.	Pandermite.
1894..	5,950	6,700	367	176	2,746	800	9,100
1895..	6,126	4,532	400	150	2,633	4,000	9,081
1896..	12,310	7,486	340	184	2,616	1,179	12,626
1897..	17,600	3,168	280	198	2,704	11,850	11,375
1898..	13,911	7,034	184	230	2,650	7,178	.....
1899..	21,834	11,951	.....	183	2,674	7,638	.....

Reduced to percentage and rank this table shows as follows: In 1894 Turkey ranked No. 1 and produced about 32% of the whole amount; No. 2, Chili, producing about 26%; No. 3, the United States, producing only about one-quarter of the world's supply; No. 4, Italy, about 11%; No. 5, Peru, about 4%; No. 6, India, with about 2%, and last of all Germany, with only about one-half of one per cent.

In six year's time this condition of affairs had wholly changed. The United States has leaped from the third to the first place, producing over 50% of the total amount of the world, followed by Chili which produced about 30%. Peru produced about 11% and Italy about one-third as much as Peru. Germany stood still at one-half of one per cent, while Turkey, the former leader, dropped out of the race in 1897, followed by Italy which ceased operations in 1899. It will be seen from these facts that California produces over one-half of the world's supply of borax. If this rate of increase of production is maintained for a few decades, the next generation will have to import their supplies instead of depending on home resources; unless steps are taken to conserve the contents of the dry lakes or saline lakes of this country.

In this connection it will be well to consider briefly the nature of the foreign sources of supply. In speaking of the foreign sources in general the Mineral Industries says:

The foreign sources of borax are the following: The Tuscan Hot Springs; the ulexite bed at Suzurlu, in Asia Minor; the alkaline beds in South Tibet; the small deposits in northern Chili, in the region ceded by Bolivia after the late war; and the salt mines in Stassfurt, in Germany.

Considerable quantities of stassfurtite are annually afforded by the salt mines at Stassfurt, Germany. The mineral occurs in small masses, from the size of a barley corn to that of a bean, imbedded in the salt.

This source is too limited to enable this country to become a producer of note. There is very little information accessible in regard to the source of India's supply.

It is obtained from the alkaline basins or deserts of that region and is brought to northern India. While it is the oldest source of supply of this material, very little is known definitely about the occurrence or extent of the deposits.

They seem to be dry lakes similar in origin and character to these of California. Italy produces no borax, but has a limited supply of boric acid from which borate of soda (borax) can be made. The third annual report of the State Mineralogist of California, 1883, contains an account of the occurrence of the acid from which the following notes are quoted:

The boric acid of Italy comes from the districts of Volterra and Pumarance, in the province of Pisa. Near the town of Marbo there are about forty hot springs whose waters contain boric acid, the acid being obtained by conducting the steam into vats where the acid is crystallized from the vapor. These springs are called "Lagioni," which has held to the idea that the source of the Italian borax was lagoons or lakes, which is not the case.

The only other locality mentioned is as follows:

Boric acid is also found in the waters of the small lake of Monte Rotondo in Italy, from which it is recovered by evaporation. As this lake has only an area of about eighteen acres, it is not of special importance.

The only mention in the Mineral Industries is as follows:

Italy—The product is sassolite or crystallized boric acid, from which borax is made with soda.

The deposits of Peru and Chili are found in "dry lakes" similar to those in California. Mineral Industries says:

Peru and Chili—Both of these contain the borate or dried-lake bottoms, in association with various alkaline salts, and practically described for California.

In a report published three years later is the following:

One of the most important of the earliest sources of borax are the deposits of Ascotan and Maricunga, north of Copiapo in Atacama, Chili, where ulexite, known locally as "tiza," occurs in old lake beds in layers alternating with layers of salt and salty earth. A recent British consular report contains the following interesting particulars about the Maricunga borax district. The lake where the borax is found measures 32½ kilometers from north to south and 20 from east to west, giving an area of 650 square kilometers. Uppermost is a layer of salt 20 centimeters thick, mixed with clay and mud, and below this a layer 24 centimeters thick, averaging 27% boric acid. Below the layer of borax is another of a mixture of borate of lime, soda and clay, impregnated with iron. Below this again is another layer of borax 9 centimeters in thickness. The quantity of borax in the unexplored part is calculated at 69,000,000 tons. A railway line passing through this district was recently surveyed, and its construction is now under consideration.

It is evident from the above that Chili and Peru are the only rivals of importance that California and Nevada have; and that the world's supply must be obtained from these two regions in North and South America.

VALUE OF THE SODAS.—So far attention has been called more especially to the borax because it is a

heard of the "alkali deserts" of the West, and the sight of plains covered with a sandy-like mantle of salts is familiar to every transcontinental traveler. These salts are mainly sodium carbonate, sulphate and chloride, sulphate predominating on the eastern side of the basin, carbonate on the west side, chloride, as in the Great Salt Lake, occupying the central position. Of course this division is only approximate, and the salts are generally mixtures of all three.

It is not necessary to go into voluminous details. Two or three quotations are sufficient to show that the value of the natural sodas of California is recognized in the commercial world, and that this industry is already well established. Quoting from the Mineral Industries nine years later than the date of Prof. Chatard's report, as quoted above, we read:

There was a considerable production of sodium carbonate in 1900. The production, reduced to a basis of 58% ash of natural soda in the United States, came from California and Nevada, and amounted to 14,000 short tons (\$195,300), as against 10,500 short tons (\$147,000) in 1899. The producers were the Inyo Development Co. of California and Nevada, Griswold & Epperson of Wadsworth, Nev., and Occidental Alkali Co. of Hawthorne, Nev. \* \* \* And for the following year (1901) we find the production of sodium bicarbonate, reduced to the basis of 58% ash, was about 15,000 short tons (\$197,000), as against 14,000 short tons (\$195,300) in 1900. The production continues to come from California and Nevada.

Evaporation of Salt in San Mateo County, Cal

Salt Making Near Redondo Beach, Los Angeles County, Cal This Small Lake Was Formed by the Building of a Sand Spit Between the Mainland and the Ocean.

rare and unique mineral that cannot be produced in chemical manufactories except from natural borates. Boric acid, borate of lime, or crude borate of soda, must first be taken from some one of nature's storehouses as the basis of the manufacture, and, as already shown, such storehouses are rare.

Carbonate and bicarbonate of soda, and sulphate of soda, have been made for many years from salt, soda, ash, etc.; but this artificial method is more or less expensive. The discovery of "natural soda" a couple of decades ago has not only helped the manufacture by lowering the cost of production, but also the consumer by lowering the price. The principal sources of supply of the United States are the lakes in the California and Nevada portion of the "Great Basin." Prof. Thomas M. Chatard, the chemist of the United States Geological Survey at Washington, D. C., spent some months at these deposits in California and Nevada and has made a special study of them, and is considered the leading authority on "natural sodas" in America. He says:

Natural soda is the residue obtained by the evaporation of natural alkaline waters without the aid of artificial heat. It is composed of sodium carbonate and bicarbonate in varying proportions, mixed with impurities, mainly sodium chloride and sulphate. It is found to some extent in all dry regions, such as Hungary, Egypt and the deserts of Africa and Asia; but nature has been especially bountiful to the United States in giving us a most valuable source of national wealth in the despised and detested "alkali dust" and "alkali water" of the Great Basin. \* \* \* Everyone has seen or

The production of soda in the United States for the year 1901 was 480,000 metric tons, as compared with 390,000 tons for the year 1900, and the imports for 1901 were 24,859 tons. A total of 15,000 tons from the natural soda deposits of the Pacific coast is not large when compared with the total production by artificial processes in the East; but it shows that the industry is well started; that the demand is enormous, and that the soda industry of the West may soon rival that of the rest of the world, just as borax has. The enormous consumption of artificially produced soda carbonates plus the importations show a demand that makes the deposits of natural sodas in the West most valuable. As the population of the country increases, the consumption of such an article as soda, used daily by every family, must rapidly increase, and all natural soda deposits must become more valuable as the consumption increases. Dr. Chatard, looking into the future, says:

It is not improbable that the natural soda fields and springs of the western United States will be in time an important factor in regulating and probably depressing the market.

OTHER SALINES.—Before leaving the question of the value of these deposits of borax and natural sodas, we wish to call attention to the fact that borax and carbonates of soda are not the only valuable salines that they contain. The numerous analysis scattered through the reports on these "dry lakes" of the California State Mining Bureau and the United States Geological Surveys show that these saline deposits

also contain large quantities of compounds of magnesia and potash, sulphate of soda and more or less of the rare iodine and bromine. All of these will be utilized in the near future, as chemical manufactures increase on the Pacific coast and attention is paid to the by-products of these saline lakes.

## Milling of Auriferous Ores in New Zealand.\*

NUMBER II.

Written by H. A. GORDON.

There are different opinions as to the weight of stamps that should be used. Until within the last four years the weight of each stamp in any of the batteries did not exceed 800 pounds, but it is generally held now that it is more economical to have stamps of 1100 pounds, as they do better work, the height of drop depending on the hardness or friability of the ore to be crushed. As a rule, a low drop and quick action give the best result in forcing the pulverized ore through the screens. The stem, 15 feet long, 3½ inches in diameter, weighs 482 pounds; the head, 20 inches long, 9 inches in diameter, 350 pounds; the shoes, 9 inches long, 9 inches in diameter, 159 pounds; the tappet, about 130 pounds. This makes a total weight of 1121 pounds.

Whatever height of drop is determined, the stamps should be driven as fast as possible, so long as the tappet does not fall on the cam. This speed can be ascertained mathematically from a formula which gives the following speed:

Drop of	Drops per Minute.
4 inches	118.3
5 inches	110.5
6 inches	104.8
7 inches	99.8
8 inches	95.3
9 inches	91.5
10 inches	88.2
11 inches	85.3
12 inches	82.0

The coefficient is from experiments made in actual working, which showed that 0.21 of a second was the period that the stamp required to be at rest in order to obviate the tappet striking the cam. That is, the stamps can be run at the speed mentioned with perfect safety.

In some mills where the batteries are placed on level ground a hydraulic hoist is used to lift the ore to the bins, or, if it has gone through the rock breaker, it is lifted and dumped on to a grizzly; but where the ground will admit the mine trucks are run on the top of the grizzly platforms.

In the older mills the stems are screwed at a place where the tappets are fixed, with a key-way cut in the stem, so that a vertical key can be driven in where the tappet is placed to the required height; but in all the modern mills the stems are without the thread from end to end, and the tappets are held to the stem with three cross-keys. The most modern mills in the colony have been supplied by the Allis Chalmers Co. of Chicago and London.

A jack shaft about 3 inches in diameter rests on brackets bolted to the frame, having finger bars.

The mortars for heavy stamps are generally of the Homestake pattern, weighing about three tons. The mortar bed is from 7 inches to 9 inches thick, and the sides at the bottom of this 4½ inches; the inside dimensions being—width at the bottom, 10½ inches; length, 4 feet 3 inches, with a total height of 4 feet 8 inches. Arrangements are made for having a chuck-block covered with silver plate inside the mortar box for collecting amalgam; but in many cases this is not used. All the dies and shoes are made of steel, which is found to be more economical than those made of chilled white iron, as they last longer and wear more evenly.

The screens generally used are made of iron wire gauze of from 20-mesh to 60-mesh, according to the quality of the ore under treatment. In the majority of mills in the north island a 30-mesh to 40-mesh screen is used, but in some cases where the gold is very fine in the matrix the ore goes through a 60-mesh screen. In the south island the gold is generally in much coarser particles, and therefore a coarser mesh screen is used. In most of the old mills the screens used are made of punched charcoal sheet iron.

The amalgamating tables are generally about 5 feet wide, constructed on a gradient of from 1½ inch to 1¼ inch to the foot, and vary in length from 9 feet to 12 feet. There is a grooved ripple near the head of the tables, below which they are covered with copper plates, or in some instances plates of muntz metal coated with quicksilver. In modern mills the copper plates are about ¼-inch in thickness, in some instances electroplated with one ounce of silver per square foot; but some millmen prefer to scour the plate and coat with quicksilver themselves. In any case, the plates require to have an even and smooth surface, and to be laid down on the table perfectly level transversely. In the early days of gold milling the amalgamating tables were covered with plates of very thin copper, which were liable to buckle and form an uneven sur-

face, which is a very objectionable feature in securing good amalgamation. In removing the amalgam the plates are slightly scraped, and when once they have a thin, hard coating of gold amalgam they are in a far better condition to save gold.

In regard to the quantity of water required millmen have different opinions. This, however, has to be regulated in proportion to the gradient of the tables and the character and quantity of the crushed ore. The crushed material requires to pass over the plates in an even and thin film, with as little water as will keep them clear.

In some mills the pulp from the tables passes into spitzkasten and spitzluten, as in the case of the Kauri Freehold Co.'s mill at Gpitonui; the overflow is lifted by 2-wheel elevators and deposited in the percolating vats to be treated with cyanide solution, while the coarse sands are reground in a mill before they are subjected to cyanide treatment. In the south island the pulp from the tables of the Progress mines of New Zealand mill, at Reefton, passes through an amalgam trap on to vanners, where the ore is concentrated, two vanners being used to every five head of stamps, while the sand and slimes from the vanners are carried away in a chute and distributed over a large plant of canvas-covered tables, where a further concentration takes place. These tables are constructed in 3-foot divisions and 12 feet long, on a gradient of about 2 inches to 1 foot. There is a small sluiceway in the main chute, which can be regulated to let out the necessary quantity of sand and water on a distributor at the head of each table. The pulp is allowed to run over the tables in as thin a film as possible. These are covered with fine duck. Each four divisions are constructed level transversely, and the next four divisions are at a slightly lower level, so as to correspond with the gradient of the chute carrying the sands and slimes from the mill. This chute is carried down along the head of the tables, so that each set on the downward grade has to be at a lower level to allow the pulp to be run over them. The fine sand and slimes flowing over these tables are carried away into the river by the tail water from the turbines which drive the machinery of the mill.

After allowing the water to pass over the tables for about two hours the headgates in the main chute for one set of tables are closed, and the fine concentrates lying on the canvas are washed down with water from a pressure hose into a small chute, which conveys the concentrates into a tank at the lower end of the tailing plant, where a small centrifugal sand pump is placed. This forces the water and concentrates into a trough or tank at a higher level near the roasting furnace. The concentrates are removed from this trough and stacked ready to put through the roasting furnace previous to chlorination.

In the north island the tailings or pulp passing over amalgamation tables is run into percolating vats, where it is treated with cyanide solutions.

In regard to the pulp after it leaves the amalgamating tables, it depends on the class of ore as to what treatment it is subjected to. If it contains much sulphurets it has to be concentrated, the concentrates roasted, and the roasted ore treated by chlorination or by cyanide solution. In the north island the large percentage of silver alloyed with the gold in the ores cannot be extracted unless the ore is roasted and thoroughly chloridized, and the ores are in general of too low a grade to pay for roasting. The only place where a roasting furnace is attached to a large mill is at the Progress mines of New Zealand mill at Reefton. The general system in the north island is to treat the pulp by cyanide solutions.

The size of a cyanide plant depends on the quantity and character of the ore, the general practice being to have a dissolving tank, standard solution vat, percolating or leaching vats, sumps, agitation vats, zinc precipitation boxes, solution pump, vacuum chamber and air pump, melting and roasting furnace, and laboratory.

A dissolving tank only requires to be a small one, sufficient to dissolve the KCy; it may be made 3 feet, 4 feet, or 5 feet in diameter, and from 2 feet to 3 feet in depth. The salts are, in some plants, placed on a perforated tray after being broken up in small pieces. The tray is suspended in the tank by having a wire rope attached to the tray and on a pulley overhead; the shaking of the tray in the tank greatly facilitates the solution of the salts. When the salts are dissolved the liquor is run into a standard solution tank, where the strength is made up to from 10% to 15% of KCy, or whatever strength is decided on. One pound of pure salts dissolved in ten pounds of water will give 10% KCy solution.

The leaching or precipitation vats are in general constructed of steel plates and coated with a mixture of tar, pitch, and kauri gum. The dimensions of the vats vary considerably—from 20 feet to 50 feet in diameter, and from 4 feet to 7 feet in depth. Some of the vats belonging to the Waihi Co. at its Waihi mill are made of concrete, 50 feet by 50 feet, and about 4 feet in depth; but the more recent vats constructed by this company are all circular and made of steel plates. At the bottom of each vat there is a filter frame constructed of wooden slats 1 inch wide, notched together so that all the divisions are 1 inch square. These frames are made in sections so as to be easily handled; in large vats there

may be eight sections in one filter frame. This frame is kept up about 3 inches above the bottom, and when laid down has to be about 2 inches less diameter than the bottom of the vat. A filter of cocoanut matting and hessian cloth is laid on the top of the filter frame, and held tight against the vat by having a rope tightly packed into the space between it and the edge of the filter frame. Two pipes 2 inches in diameter are generally placed in each vat, with brass cocks to draw off the filtered solution to the zinc precipitation boxes. In the early cyanide plants a filter bed made of gravel was laid on top of the filter frames; but these beds very soon became so impervious that no solution could get through, and, also, in removing the sand after treatment the beds were liable to be damaged. The filter cloth has taken the place of the bedding and is found to answer far better.

Most vats have distributors attached to distribute the pulp evenly over their surface: this is done by a set of revolving arms made of gaspipes, bent at the ends, and all of different lengths—the water and pulp from the battery flowing through the pipes with bent ends cause them to revolve on the same principle as a turbine wheel. The vats are filled to within about 6 inches of the top, and are allowed to settle; the water is then siphoned off and the solution of KCy put on. The solutions from the sumps are now pumped up into the top of the ore, and the required strength made up by adding a certain quantity of the standard solution. To ascertain this quantity the strength of the sump solution is tested by standard nitrate of silver solution in the usual manner, and when the strength is ascertained, and also the quantity of the solution required, the additional quantity from the standard solution vat is easily arrived at—as, for example, if twenty tons of sump solution were used containing .1% KCy, and a working solution required was .3%, the number of pounds of a 15% standard solution would be as follows:

	15%	0.3
	0.3	0.1
	14.7	0.2
therefore 14.7 : (20 x 2240) :: 0.2		
8960		
— 600 52 pounds of strong solution.		
14.7		

(TO BE CONTINUED.)

## "'Malgamatin'."

TO THE EDITOR:—Here is something which may appeal to some of your readers. As a bit of realism it strikes a sympathetic chord in mill operatives.  
Boulder, W. A., Aug. 2.

'Malgamatin' on the pans  
Down the Golden Mile,  
Mixers belchin' boilin' sands  
Swellin' someone's pile.  
Heat and dust and KCy,  
Hot mud splashin' in your eye,  
Twenty pans rotatin';  
Spin, you whirlin' devils, spin!  
Can't hear nothin' for the din,  
'Malgamatin'!

Now the elevator's stuck,  
Twisted buckets jammed;  
Never saw such purple luck,  
May the job be d—d!  
For this flamin' dust is chokin',  
Might as well in hell be stokin',  
"Bash those edges straight in!"  
"Pass, oh pass the hammer here!"  
'Taint all counter lunch and beer  
'Malgamatin'!

Chippin' mudflake off the edge,  
Hammer-head went plump!  
Close up three-pound weight of sledge,  
Hear the muller bump!  
Snatch the clutches out of gear!  
Blazes! won't the foreman rear!  
Here's a lovely ratin'!  
(Can't he give it to a bloke!\*)  
Bet a quid† there's somethin' broke,  
'Malgamatin'!

Boss says, "Clean up, Number Four!"  
Get the tackle to her;  
Lift the muller from the floor,  
Guess we'll have to shoe her!  
Jam the bars beneath the dies,  
Put some weight on, up they rise,  
Set those cogs gyратin'."  
Pans on either side a-steam'!  
Lord! it ain't no place for dreamin',  
'Malgamatin'!

Lyn' thick between the dies,  
Cloggin' up the pan,  
Don't it tempt a fellow's eyes,  
Man is only—man!  
Half a hundredweight in this,  
Ounce or two they'd never miss—  
Go to blazes, Satan!  
While my girl's in me believin',  
Haven't got no time for thievin',  
'Malgamatin'!

\* Slang for "one of the common herd."  
† Slang for £1.

THE daily press reports the theft of amalgam valued at \$25 from the plates of the California quartz mill at the St. Louis Exposition, which makes the exhibit even more realistic than before.

Crushing in Cyanide Solution as Carried on in the Black Hills, S. D.\*

Written by C. H. FULTON.

The crushing in cyanide solution process was first introduced into the Black Hills at the old Dakota plant at Central City by J. M. Henton. The method originated in New Zealand, being first used by F. R. W. Daw, in 1897, at the Crowns mine. In the Black Hills it has become practically the established method for the denser siliceous ores, there being at present five plants in operation using this method, with several more of the same kind projected. The dry crushing process still holds its own on the more porous and open siliceous ores, and there are also plants in operation which do fine, dry crushing on dense siliceous ores. The mills employing the crushing in cyanide solution process are the Horseshoe, 120 stamps, 60 in operation; the Dakota mill, 30 in operation; the Maitland mill, 40 stamps; the Hidden Fortune mill, 60 stamps, and the Lundborg, Dorr & Wilson mill, a 6-foot roller mill.

GENERAL FEATURES OF THE PROCESS.—The process comprises the following operations:

1. The crushing of the ores, generally by stamps, in a cyanide solution ranging from 1.3 to 2.2 pounds of cyanide per ton, and carrying a protective alkalinity equivalent to 1 to 1.5 pound of sodium hydrate per ton.
2. The separation of the sands from the slimes by means of cone classifiers.
3. The treatment of the sands by percolation.
4. The treatment of the slimes by agitation and decantation.
5. The precipitation of the values by means of zinc thread.

The process is applicable to the dense siliceous ores that require a comparatively fine crushing, and which contain but a small quantity of cyanide consuming compounds. For ores that without previous alkaline treatment destroy much cyanide the process is not applicable. As a matter of fact, it may be stated that the cyanide consumption in this method is higher than in dry crushing. The cyanide consumption in the wet crushing mills of the district varies from 0.75 to 1.50 pound per ton of ore treated. At a typical dry crushing plant, the Imperial mill at Deadwood, milling the same class of ore, the consumption is 0.4 pound per ton. At the other dry crushing plants of the district it ranges from 0.4 to 0.75 pound per ton. The increased consumption of cyanide is a defect inherent in the process for several reasons: 1. Agitation of the ore with cyanide solution in the battery causes extra consumption. 2. Although the battery cyanide solution carries a protective alkalinity (alkalinity above that due to cyanide and cyanogen compounds) of from 1 to 1.5 pound per ton, this does not by any means completely protect the cyanide from destruction by cyanicides. The reaction between cyanicides and cyanide and alkaline earth hydrates and caustic alkalies probably takes place in part at least simultaneously. It has been recognized by metallurgists that with many ores it is essential to apply a comparatively highly alkaline solution low in cyanide to the ores before the stronger cyanide solutions are employed, for the alkalinity carried in the strong cyanide solution would be ineffective in preventing a considerable consumption. 3. There is also an increase in the consumption due to the discharge of considerable cyanide in the moisture going out with the slimes tailings. This might be called a mechanical consumption. This consumption alone amounts to from 0.3 to 0.6 pound per ton of ore treated. The mechanical consumption of dry crushing plants is but an insignificant factor.

At the present time it is difficult to make a comparison as regards the relative merits of the process under discussion and the dry crushing process. There is probably, on the whole, little difference between the two processes as regards cost, although the wet crushing mills probably have a slight advantage in this respect, in spite of the slimes treatment and the higher consumption of chemicals. The wet crushing plants, of course, have an advantage in that they do not suffer from the dust nuisance. However, the hope that the wet crushing plants, on account of the great fineness of crushing that would be carried on, would be able to treat the blue ores in the raw state successfully has not been verified, and it is probable that for this class of ores roasting will finally have to be resorted to. In this case, of course, dry crushing will have all the advantage. Some of the mines of the district furnish but little blue ore, while others have a great deal in their reserves. For the first type the crushing in cyanide solution method is, without doubt, a permanent institution.

THE CRUSHING OF THE ORES.—The ores are rough crushed generally by Gates crushers and in one instance, at the Maitland mill, by a Blake crusher. The crushed ore will pass a 1.5 to 2-inch ring and is fed to the stamps by Challenge feeders. Stamps, with one exception, are used for the fine crushing of

the ore. The Lundborg, Dorr & Wilson mill employs a 6-foot Monadnock roller mill for the fine crushing, a set of rolls being placed between the Gates crusher and the roller mill, in order to get the proper sized feed of ore.

The following table gives the details of the stamps at four of the mills:

NAME OF MILL	DETAILS OF THE STAMP MILLS.			
	Type of Mortar	Capacity per Stamp in Tons per 24 Hours.	Amount of Solution per Ton of Ore	Screen Used
Hidden Fortune	Double issue, rear blocked up.	4	5	24 mesh, 26 wire.
Maitland	Single issue.	4 to 5.5 to 4	4 to 5.5 to 4	26 by 13 mesh, 26 wire.
Dakota	Single issue.	5	5	10 by 4 mesh, 20 wire.
Dakota	Double issue, rear blocked up.	4.4	5	10 by 4 mesh, 20 wire.
Horseshoe	Double issue, rear blocked up.	6.4 to 5	6.4 to 5	14 by 7 mesh, 21 wire.
* Crushing in very dilute cyanide solution and amalgamating with inside plate and over tables.				

Some of the earlier mills installed double issue mortars, with the idea of getting an increased stamp duty, but it was soon found that the amount of solution required in crushing was so great that the mills were unable to handle it economically, and the rear discharges were closed by wooden frames. It will be seen from the table that the depth of issue and the width of the mortar at the discharge level vary considerably at the different mills. The weight of stamp has not so great a variation.

As the stamps are used for crushing purposes only at all of the mills, with the exception of the Hidden Fortune, it would seem that in general a narrow box, a shallow discharge and a heavy stamp, up to 1100 to 1200 pounds, would give the greatest capacity and most economical results. However, the retaining of the ore in the mortar for a certain length of time, in order to agitate thoroughly with cyanide solution, is desirable. At most of the mills from 50% to 53% of the values of the ore is extracted in the batteries and the classifying cones. Stamps for this type of crushing should attain a capacity of five tons and over per stamp, and in the later designs of mills to be built this has been provided for. At some of the mills the ore is very hard, which in part accounts for the rather low capacities.

The screens used also vary considerably at the different mills, ranging from 26 mesh 26 wire to 10 mesh 20 wire. This is necessitated by the requirements of the individual ores, which, while having the same general characteristics, differ somewhat in the fineness of crushing required.

Recently several of the mills have installed wire cloth screens, in which the opening is rectangular instead of square, the long dimensions in these screens being from two to two and one-half times that of the short dimension. Screens of this type give somewhat greater capacity and do not choke so readily as screens with a square mesh.

The denser siliceous ores require a comparatively fine crushing, but if the crushing is carried beyond a certain fineness nothing is gained in extraction, and trouble is encountered in the production of an excessive amount of slimes, which are difficult to handle in the mill. It has been demonstrated that if the ore is crushed so that the great bulk of it is not coarser than 30 mesh (0.0195 inch), and not finer than 60 mesh (0.0075 inch), the most economic extraction is obtained. Material finer than 60 mesh yields but very little higher extraction than that between 30 and 60 mesh.

The 5% greater extraction obtained in the mills on the slimes—although the recovery is the same as on the sands—is for the greater part due to the agitation obtained in the treatment. If the size of the ore particles, however, is coarser than 30 mesh, the extraction on most of the ores is materially decreased.

The following table shows the nature of the mill product made at some of the mills:

TABLE II.—MECHANICAL ANALYSES OF MILL PRODUCTS.

NAME OF MILL.	NAME OF MILL.			
	Mesh of Screen	Dakota—Stamps, Screen 10 by 4 Mesh, 20 Wire	Lundborg, Dorr & Wilson Mill, Screen 18 Mesh, 0.046-inch Space	Imperial—Rolls, Screen 16 Mesh, 21 Wire
Percentages Remaining on Screen.	Plus 20	12.7%	1.0%	3.0%
	Plus 30			18.0%
	Plus 40	23.0%	10.0%	17.0%
	Plus 60		10.0%	16.0%
	Plus 80	14.8%		5.0%
	Plus 100	6.0%	10.0%	5.0%
	Minus 100			36.0%
	Plus 150	14.8%		
	Minus 150	29.8%		
	Plus 200		19.0%	
	Minus 200		50.0%	

The Dakota mill uses the coarsest screens of any of the mills and gets a product about 20% of which is coarser than 30 mesh, a rather high percentage, but in view of the very low tenor of the ores treated, and their shaly nature, this crushing is the most economical that could be practiced. The other mills use finer screens and their mill product approaches closely to that of the Monadnock mill, quoted in the above table. One mill—the Hidden Fortune—crushes some cement ore which contains considerable coarse free gold. This mill has adopted the crushing in cyanide solution process in conjunction with amalgamation inside and outside of the mortar. A very weak cyanide solution—1.5 pound per ton—is used with success as a battery solution, no difficulty being experienced to get good amalgamation. The plates need somewhat more frequent dressing, owing to the hardening action of the cyanide on the amalgam. This same method is used, in part, at one or two mills employing the Diehl process at Kalgoorlie, Western Australia. It is also very probable that the plates will have to be more frequently renewed, owing to the solvent action of the cyanide.

(TO BE CONTINUED.)

Perfection Dust Collector.

Dust is an ever present problem in stamp mills and ore reduction plants. Wherever ore is treated, whatever the form of reduction, the dust is often a dreadful nuisance and a menace to health and a constant source of expense. In many cases the loss occasioned is considerable. Mining men and others will be pleased to know of a machine that the makers say they guarantee will solve the dust problem wherever it is put in, and in many cases result in a considerable saving in values.

Reference is made to the "Perfection Dust Collector," made and sold by Prinz & Rau, Milwaukee, Wis. The device is illustrated herewith. This dust

Perfection Dust Collector.

collector is made up of a central drum having openings through which the dust-laden air passes into cloth tubes, the dust adhering to the sides thereof. When the drum moves a number of these dust-laden tubes are thus brought directly over the conveyor, which automatically shuts off the air from entering these tubes, the rubber-faced hammers at the same time, in connection with the back draft, effectually cleaning the tubes of all adhering dust. As the drum revolves each row of tubes discharges the dust

\* Bulletin No. 7, South Dakota School of Mines.

into the conveyor, by which it is carried out of the machine.

Any one who has choked and gagged in the dust of a dry mill will appreciate the fact that a machine has been found that will clear the air, enable them to work in comfort, and at the same time save values that now go to waste. One man writes that he has a Perfection Dust Collector that collects 300 pounds of dust every day.

The Prinz & Rau Mfg. Co., Milwaukee, Wis., are the sole makers of this machine. It was invented by Mr. Prinz, who did all the experimenting and made it a practical working machine before offering it for sale. The company have testimonials from managers and superintendents of milling and mining companies throughout Colorado, South Dakota and elsewhere, commending and endorsing their dust collector, and speaking particularly of the good work it does in collecting the dust that before had been such a nuisance and a positive injury to health. The collector further commends itself by not only clearing the air and giving one a chance to breathe, but also by saving values in dust which would otherwise be lost.

The Prinz & Rau Manufacturing Co. claim that their Perfection Dust Collector is "the only machine that has proved a success in the saving of valuable dust in chloride, cyanide and bromide mills, dry concentrating plants, furnaces, roasters and other mills in which dust is created in the reduction or treatment of ores. The collection of this dust is not only a source of revenue, but at the same time a great protection to the workmen who have to inhale the injurious dust. The Perfection Dust Collector is also extensively used in collecting dust arising in cement mills, lead and zinc works and bricqueting plants. By the use of fans connected with pipes having suitable hoods for concentrating the suction, the dust can be blown into the Perfection Dust Collector and automatically separating the air, delivering it to any desired point, and allowing the air to escape perfectly free from dust. The dust when discharged can be automatically blended with the pulp without affecting any subsequent treatment. When the dust to be collected is of a sharp sandy nature, or the air in which the dust is mingled is of a high temperature we strongly recommend the Perfection Dust Collector with perfected sheet steel central drum. The steel drum collector is especially adapted for handling hot air from furnaces. A small amount of cold air blended with heated air from the furnace precipitates the fumes and allows the values to be collected. When the dust to be collected is of soft nature, our regular or standard collector can be used."

## Borax in the United States.

The amount of crude borax produced in the United States in 1903 was 34,430 short tons, valued at \$661,400. The production in 1902 was 17,404 short tons of refined borax, valued at \$2,447,614, and 2600 short tons of crude borax, valued at \$91,000, a total of 20,004 short tons, valued at \$2,538,614. Of the refined borax 862 short tons, valued at \$150,000, were boric acid. Had the valuation in 1903 been taken on the refined instead of the crude product the figures would have been \$2,735,000 instead of \$661,400.

Refineries for borax are located at Bayonne, N. J., Brooklyn, N. Y., New Brighton, Pa., Chicago, Ill., and Alameda, Cal., where various more or less secret processes are employed to convert the crude material into products designed for various uses.

Borax is used for many purposes. When melted at a high temperature it dissolves metallic oxides and forms transparent colored glasses. It is used as a flux in welding metals and in melting gold and silver. It is employed in the manufacture of granite iron ware and of enameled bath tubs and other articles, as well as in making pottery and earthenware. Manufacturers of the hard, tough grades of glass and of encaustic tiles are large users of borax. It is used by painters, tanners, hat makers, and calico makers, as well as by beef packers.

The domestic uses of borax are widely known, and in chemistry and metallurgy the borates are employed in many ways.

An account of the borax industry in the United States is given in a pamphlet entitled "The Production of Borax in 1903," by C. G. Yale, forming a chapter in "Mineral Resources of the United States, 1903." This pamphlet, which contains detailed statistics covering the production and importation of borax in 1902 and previous years, is printed for gratuitous distribution and may be had by application to the Director of the United States Geological Survey.

A LARGE number of Chinese coolies have recently been taken to the Rand, and a much larger number are expected to be shipped. What the outcome of this experiment will be—for it is considered an experiment even by the most serious supporters of the movement—can not be determined until several months of trial have been given the undertaking. It has been found that, as elsewhere, the expense of mining on the Rand increases with depth, the mechanical difficulties increase, and the value of the ore in great depth, if not decreasing, surely does not increase. Naturally cheap labor is required if the mines are to be operated for profit, for not only is it

necessary to make a profit over running expenses, but also to cover interest on the large capital investment, which in the larger concerns usually exceeds \$3,000,000. Whether a fewer number of well-paid, skilled workmen can be employed to greater profit than can be made by working a large number of unskilled Chinese, remains to be shown by the experiment now being tried.

## Boom Swinging Gear for Hoisting Engines.

The Lidgerwood Mfg. Co., New York, have put upon the market three different types of boom swinging gear for derrick engines. In the No. 4 swinging gear illustrated herewith the company have devised

Lidgerwood Standard Double Friction Drum Engine and Boiler Equipped With No. 4 Boom Swinging Gear.

another apparatus of the kind; it is employed for swinging the boom of an ordinary derrick while simultaneously the boom is being raised and the load hoisted.

This new swinging gear consists of a drum shaft with two gear wheels and two drums and a friction shaft and two frictions and pinions mounted on side stands tied together by two flat steel braces secured to the bottom of the side stands and countersunk in them, making an independent apparatus, which is mounted on an extension of the engine skids and fastened to the front ends of the engine bedplate. If desired, the engine bedplate may be extended and the swinging gear mounted on it. The friction shaft is driven by a pinion, next to the winch head on the forward drum shaft, meshing with an idler gear, which in turn drives a gear wheel keyed fast to the outer end of the friction shaft. There are two cone frictions on the friction shaft, the male part carrying the friction woods, being mounted on the shaft with a feather key, and the female part being cast with a pinion and mounted loosely on the shaft. The pinion of one drives a gear directly on the drum shaft, thus turning the drums in one direction, while the pinion of the other drives an idler pinion, which in turn drives the other gear on the drum shaft, turning the drums in the other direction. The drums are spirally grooved and the ropes wind over on one drum and under on the other.

One of the swinging drums is keyed fast to the shaft; the other is loose thereon, but prevented from turning by means of a collar keyed to the shaft, on which are lugs or projections which fit into corresponding recesses in the drum. When the collar is loosened and moved back, the drum may be revolved far enough to take up the slack, due to the stretching of the rope, and then the collar moved back into place and secured. The drums being outside the bearings, the ropes leading to the bullwheel are not in the way of hoisting and boom lines.

The No. 4 swinging gear is made on the duplicate part system and all parts are easy to get at and can be placed upon any of the Lidgerwood standard double drum hoisting engines, either with or without boiler.

The Lidgerwood Mfg. Co. are showing this new No. 4 swinging gear in their fine exhibit at the St. Louis Exposition in Machinery Hall, where it is attracting considerable attention.

## A Crucible Charge for Gold and Silver in Zinc Ores.\*

Written by E. J. HALL and E. POPPER.

Experiments have been conducted for the past four years by various members of the chemistry department aiming to improve or supplant the present scorification method of assaying zinc ores for the precious metals.

Investigations were made on the scorification assay using oxide of iron in Furman's "Manual of Assaying," a combination method similar to that used for copper mattes, and a scorification charge using soda.

However, all of these methods proved to be just as troublesome as the ordinary scorification method,

which frequently necessitates the use of but small amounts of ore (.1 A. T.), as well as constant attention and manipulation to prevent the formation of zinc crusts. Furthermore, the results were no better.

Therefore, the following investigations were conducted with the hope of eliminating both the troubles inherent in any scorification, as well as the special difficulties met with in the scorification of zinc ores, by the use of a crucible method.

The preliminary work consisted largely in experimenting with nails and with nitre as desulphurizing agents on sphalerite, the most common zinc ore, and in studying the effect of varying the amounts of litharge, soda and borax glass.

Omitting the details of this work, it is sufficient to say that, after making some two hundred fusions, the results indicated that the most satisfactory charge must contain:

1. Only sufficient litharge to give a lead button of proper size to collect the gold and silver, on account of the difficulty in regulating the size of the button, and because lead oxide in the slag seems to interfere with the complete decomposition of the ore and prevent the formation of a slag which is free from lumps and readily poured.

2. Soda ( $\text{Na}_2\text{CO}_3$ ) four or five times as much as ore.

3. Borax glass sufficient to prevent the charge from being entirely basic and assist in fluxing the gangue minerals not acted upon by soda alone.

4. Argol, if necessary, sufficient to reduce all the lead.

It may be necessary to add a couple of nails if the ore is high in pyrite (over 15%) to prevent the formation of a brittle button. The final charge adopted was:

Ore.....	1	A. T.
Soda ( $\text{Na}_2\text{CO}_3$ ).....	1 1/2	A. T.
Litharge.....	1 1/2	A. T.
Borax glass.....	1	A. T.
Argol.....	0 to X	

The reason for using only one-third A. T. of ore is the tendency of the charge to boil excessively, and the danger of overflowing when a larger charge is run in a 20-gram crucible. This boiling is not caused mainly by decomposition of the ore, but apparently

\*School of Mines Quarterly, Columbia University.

by the action of the soda on the silica of the crucible, as it may continue long after the fusion is complete. The charge given is very similar to that of Aaron.

The experiment was made of varying the temperature (measured with a Le Chatelier pyrometer), and it was found that best results were obtained from 750° C. to 775° C. Above this temperature (which is about that of scorification) the results were lower, in some cases considerably below the scorification figures. The time required in the muffle was from thirty to thirty-five minutes.

In view of the fact that an ore containing 15% of copper could not be satisfactorily run with this charge, experiments were made to determine the amount of copper which could be taken care of. Ores were made containing varying percentages of copper sulphide, and it was found that ores containing up to 7½% of copper could be satisfactorily assayed.

There is no doubt in the minds of the investigators that the charge could be used for one-half A. T. of ore, the fluxes being increased proportionately, if the fusions were made in a 30-gram, low-form crucible (Denver Fire Clay Co.). The results compared with scorification follow:

Ore.	Per Cent Zn.	Scorification .1 A. T. Oz. Au and Ag per Ton.	Crucible ½ A. T. Oz. Au and Ag per Ton.
1	2.5	48.00	48.20
2	5.0	10.00	10.41
3	6.0	9.70	9.78
4	8.0	42.50	42.54
5	9.5	165.00	168.48
6	11.5	125.80	129.40
7	11.5	38.00	37.95
8	17.5	17.10	17.16
9	27.5	135.80	139.35
10	29.7	85.00	87.66
11	35.6	105.70	106.56
12	44.0	71.10	73.83
13	47.6	44.80	47.28
14	52.0	40.10	41.34

The gold and silver beads were not parted, as the gold present would not affect the comparison.

A study of the table will show that in every case the results by this crucible charge either checked or exceeded those obtained by scorification.

### Isolated Mining Regions.

In the high Sierra of California there are many beautiful valleys through which roads already have been built, or in which they may be constructed at no greater expense than that attaching to road building in the foothill region. The topography of some of these valleys is such that they have been surveyed with a view to making them the sites of reservoirs for mining and other purposes. Some of these valleys are in the vicinity of mines and undeveloped mineral deposits. The accompanying illustration is that of Bloody canyon, as seen from the meadows at

Mono county. The Mono pass is at an altitude of 10,600 feet above the sea. The mining region is more easily approached from the western side, or by the road from Bridgeport, a few miles to the northward. In these several mining districts the ores are mostly sulphide, carrying varying amounts of copper, lead, iron, zinc, etc., beside gold and silver. The processes best suited to their reduction must vary greatly with the changing character of the ore in the various mines. In most of them amalgamation and concentration, with subsequent separation of the several products by means of electro-magnetic separators, is the best suited to the conditions at present existing there. In time, when the development of the mining industry seems to justify it, railroads will undoubtedly penetrate this region, and then smelters will become an important factor in ore reduction. The topography of this section of the Sierra Nevada is not unlike a great portion of that in Colorado, or in British Columbia. In each of the twolatter regions railroads have done much to make accessible the mineral wealth of the county, and in time these same agencies will also aid greatly in opening up the important mineral districts of the high Sierra of California.

### Tetrault Concentrator.

During the past year many changes have been made in the Tetrault concentrating table. This concentrator, illustrated herewith, is 6 feet wide by 10 feet long, covered with linoleum and without riffles, with a smooth surface. The manufacturers claim it

Tetrault Concentrator.

will not churn or mix the pulp after it is delivered onto the body of the table, but merely settles out the heavy mineral from the lighter gangue. "After the mineral takes its place on the table it passes in one continuous smooth band or stream, covered at all

the table. The clear wash water from the compartment also flows longitudinally off the table."

The tables are being manufactured and sold by the Progressive Concentrating & Milling Co., Boulder, Colo.

### Shaft Sinking in Quicksand at Hibbing, Minn.\*

Written by H. B. STURTEVANT.

The satisfactory completion of any engineering or mining feature is of interest to this Institute; and further, the Institute has certain rights to information of the details of such accomplishment. Hence this paper on sinking, partly in quicksand, of the Susquehanna shafts at Hibbing, Minn., during 1903. Our conditions were in brief as follows: A surface of 138 feet, of which 57 feet were in dry sand, 50 feet in quicksand, and 31 feet in hardpan.

Anticipating quicksand, it was decided to sink first a small shaft, to reduce difficulties to a minimum; this shaft would drain the surrounding territory, making it less difficult to sink a large working shaft near by. And further, the small shaft would be used as the permanent drainage and timber shaft. On February 15, 1903, the sod, or rather frost, was broken for the small shaft of size 8x10 feet inside; timbers 12x12 inches, studdles 3 feet and hanging bolts 1½ inch. The shaft bearers were 20 to 24 inches diameter and 32 feet long. At the depth of 45 feet six ¾-inch wire ropes were used to hang the shaft from the bearers, using 8x8-inch wrought washers ½-inch thick.

At a depth of 57 feet water and quicksand were encountered; and as considerable pull on the wire ropes was noticed we built two trusses at the collar of the shaft, using the bearers as lower cord of an ordinary queen post truss. From 57 feet we used the drop shaft method. A shaft set was beveled to an edge flush on outside of shaft and placed in position and forced down; filling in other sets above it and under the jacks successively, bolting timbers to each other, and hoisting the sand, and pumping the water. In this manner we sank 15 feet, but could go no further, and the operation was repeated until a depth of 85 feet was reached.

The experience was valuable, and we modified the method later in sinking the operating shaft, to be mentioned further on.

At 85 feet the pressure of sand being very great, and difficulties increasing, we reduced the size to 6x8 feet, building up inside the shaft a solid box with bottom edge beveled, but flush on outside, and this solid box was forced down 22 feet to 107 feet and bedded in hardpan. At 85 feet the timbers were anchored to the collar trussed bearers by four 1½-inch ropes, thus making ten wire rope hangers, besides the usual iron hangers. At 107 feet the timbers were again anchored by wire ropes. The enormous strain on the shaft timbers due to quicksand was manifested by the washers 8x8 inches pulling into the bearers fully 2 inches.

During the entire process we forced in advance of the timber a sheet steel box, 3x5 feet of ½-inch plates, put together with angle irons, and 10 feet long. This box was forced down in the middle of the shaft and served to partially drain the bottom, and to serve as a sump for the pump suction.

Progress in quicksand was very slow, and 8 to 10 feet per month was all we could do, the rate varying from nothing to 6 inches per day. We found, as others have, that the great danger to success lies in the sand and water bubbling through under the bottom timbers. To prevent this the sand was not removed faster than necessary, and when bubbling was indicated a plank hewn to edge on end, or a shovel was used and water allowed to rise a few feet; further, during the entire work in quicksand we ran eight-hour shifts, work progressing continuously in order to hold what we had made. And to avoid trouble over the idle Sunday the sand was not removed at bottom and water was allowed to rise to the pumps.

In hardpan below 107 feet depth the process used was driving lath, removing ground and placing timbers, bolting them together. Sinking progressed in clay at the rate of 1½ foot per day, until the shaft was bottomed on ledge of ore at 138 feet on September 14, or seven months from date of beginning.

The drainage increased to 300 gallons per minute

\*Abstract Trans. Lake Superior Min. Inst.

A Mountain Meadow in the Sierra Nevada of California.

the head of Walker lake. Both canyon and lake are of glacial origin, and at the head of the canyon in the distance are several small glacial lakes, and also the noted Mono pass through which hundreds of miners wended their way in the early '60s, when placer mining was active in several districts in this Sierra region. This valley is at an altitude of nearly 8000 feet, and is on the east side of the Sierra Nevada, in

times by a thin layer of water, and is not agitated or mixed up again by passing over a series of riffles. The fine particles, or slimes, are held in place by the coarser material and carried along with them into the boxes. The pulp is fed into the hopper compartment and flows down onto the deck of the table. The table is inclined longitudinally downward from this end and directs the flow of the ore longitudinally on

on July 1 at 90 feet depth and 450 gallons at 138 feet. The sinking pumps tried were unsatisfactory, because of jumping in case of air in the suction; and No. 10 Cameron pumps were substituted.

The shaft is only 2 feet out of plumb; and this does not impair its serviceability for pumping and timber. In sinking it was found necessary to use the greatest care to maintain the bottom edge of timbers exactly level in quicksand or the shaft would sink out of plumb. The water would occasionally make cavities which would fill suddenly, producing a great strain on timber and hanging ropes. There was no way of anticipating this, and as the timbering was solid there was no way to inspect behind it. Anticipating these troubles we would, while sinking, ram hay behind the timbers, and the effect was to prevent dirt washing down on outside of shaft.

It is also very necessary in sinking in quicksand to hoist no more sand than possible; that is to say, the sand will try to run into the shaft under the timbers, and if removed too fast the sand outside the shaft will become loosened and run, and cause timbers and irons to break; and the whole work may be ruined irreparably. On one occasion we noticed unusual bubbling and we immediately stopped the pumps and allowed the water to rise 15 feet, and then lowered sand from the surface and filled the shaft several feet in which condition it stood, efforts to resume being without success for six days, when sinking was resumed.

The hoisting shaft was begun July 28, 1903, 4 feet east from the drainage shaft. The size was 6x16 feet, inside, with usual timbering, to the water line. It is shown in plan in Fig. 1. It was found that the

drainage shaft pumps had drained the ground at the hoisting shaft to such an extent that a No. 7 Cameron working slowly handled the water.

The same difficulties were encountered as at the drainage shaft, but in less degree, and we are satisfied that had we not partially drained the ground by the small shaft it would have been impossible to sink the large one, because the troubles are in proportion to the external dimensions. The method in the quicksand in the hoisting shaft was quite different from that used in the drainage shaft; and particular attention is called to the following details, as we consider the method a most successful one, and not, so far as we can learn, one which has before been used.

A drop section of shaft timbers of full size of shaft was framed and placed in position. The details of the drop section are shown in Fig. 2. It is 4 feet in

depth, made of 12x12-inch timbers bolted together and braced; the lower two sets are beveled, flush outside, and a 1/8-inch plate of steel shaped to fit the edge was fastened by spikes, making a shoe or edge 3 inches wide to cut the sand; outside of this drop section was bolted a sheeting of plank, with lower edges hewn thin for less resistance to sand, and the upper end of plank extending 3 feet 6 inches above the timbers, as indicated in sketch, and behind the last permanent shaft timbers.

About 20 or 30 jacks, 2 1/2 x 18 inches, were operated between the drop section and the last permanent timbers, the plank sheeting serving to retain the sand. As the jacks forced down the drop section

Fig. 1.—Shaft Plan at Mine.

Fig. 2.—Section Showing Method of Sinking.

they were removed temporarily, and timbers placed, and bolted to the last permanent timbers; and to bring the permanent timbers close together pockets were cut out for nuts and washers. In other words, as the jacks forced down the drop section the permanent timbers were placed above the jacks and this process was continued until the iron shoe was imbedded in clay at 107 feet, after which we drove lath and after removing the ground put in timbers.

As this was to be the hoisting shaft it was very necessary that it be vertical and truly in line without serious variation. The greatest possible care in the use of jacks was necessary to success in this particular. The greatest variation from vertical is only 6 inches. As an additional protection against a crooked shaft we placed diagonal braces 8x8 inches at each end from the collar of the shaft down to depth of 85 feet. The necessity for these braces might be questioned, but our experience in the drainage shaft, where the washing away of sand behind the timbers and the caving causing the entire shaft to surge several inches, prompted us to take no chances. The shaft timbers were hung by wire ropes from the bearers at collar of shaft, but it was not necessary to truss the bearers as in the case of the drainage shaft.

As an improvement I might suggest the substitution of steel sheeting for the plank as less liable to break or get loose; and further, the steel would, being thin, allow the drop section to cut the sand easier.

We sank the shaft through the quicksand at the rate of 8 feet 6 inches to 9 feet 6 inches per month, working continuously, excepting Sundays. On reaching hardpan on January 1, 1904, we sank at the rate of 1 1/2 feet per day. As to speed of sinking in quicksand we shall not boast, but we modestly claim success in continual progress and that we did not lose either shaft; neither did we lose headway gained, excepting on the occasion mentioned above, and further, our hoisting shaft has a variation of only 6 inches.

For our conditions and with 50 feet of quicksand I can suggest no improvement over the methods used at our hoisting shaft. However, if the quicksand were 100 feet deep, the difficulties would increase, and it is probable that the freezing process might be more successful and more rapid, although the method described could be used. The essential feature of our success was the solid drop section with steel shoe and with back lath well secured and extending upwards to span the open space occupied by the jacks.

To Thomas Caddy I am pleased to give great credit for success in the sinking of the shafts.

### The Motter Furnace.

Herewith is illustrated the Motter furnace, which is 40 feet long, the roasting tube being 22 inches di-

The Motter Furnace.

ameter, fire space around outside of tubes 4 inches. The tubes ride on large wheels built on stone foundation. The furnace travels five to fifteen revolutions per minute, according to the quantity and character of the ore being treated. It has a combined apparatus for drying and roasting the ore, to leave it in condition for cyaniding, amalgamating and other chemical treatments. This machine is being manufactured by the patentees, W. H. Motter & Son, Denver, Colo.

### THE PROSPECTOR.

Rocks that contain fossils may be metal bearing as well as those of igneous origin, or metamorphic rocks in which all traces of fossils have been obliterated. As examples of ore-bearing fossiliferous rocks, may be mentioned the sandstones and shales of Silver Reef, Utah, and Permian rocks in which the fossil fish and wood have been changed to rich silver-copper ore. In the Black Hills of South Dakota the Cambrian beds and carboniferous limestones are fossiliferous and also ore bearing. This is notably the case with the upper Cambrian quartzite, which, where unaltered, is characterized by the little bore holes of arenicolites, but which in some districts becomes high-grade gold ore, and in some places is rich in lead and in silver chloride. Other fossiliferous strata in the Cambrian are also ore bearing. Fossiliferous limestones in many regions contain lead-silver and copper ores by replacement.

The rock specimens from Vaughn, Kern county, Cal., is largely composed of amphibole (hornblende) and feldspar, the whole covered with iron oxide. It is apparently from a dike of coarse grained granitic rock.

### The Mother Lode in Tuolumne County, California.\*

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by W. H. STORMS.

Serpentine is a prominent accompaniment of the lode in this county, and although gold is known to occur in schistose masses of this rock in Amador Co., none have been reported, as far as known to the writer, in Tuolumne county. Occasionally small, rich shoots or pockets are found at contact of the serpentine and other rocks—clay slate and greenstone schist—but these are of comparatively infrequent occurrence. The serpentine lies sometimes on one wall and sometimes on another. It is a curious fact that the occurrence of the mariposite-bearing dolomite and ankerite is almost always found in close association with the serpentine. Mariposite is a mica deriving its color from chromium oxide, and serpentine has long since been recognized as the principal, if not the only habitat of chromic iron, which fact may account for the persistent appearance of the chromium mica mariposite in the dolomitic mineral. In very large masses of this rock (it sometimes appears in dikes over 300 feet wide) that portion of the dolomite most distant from the serpentine usually contains but little, if any, mariposite.

The gold-bearing rocks of the lode are chiefly quartz which contains from 1% to 3%, and sometimes more, iron sulphide, and the accompanying amphibolite schists which are more or less siliceous and also contain auriferous iron sulphide. In some mines rock of the latter description forms the principal ore-bearing material. All of the important mines have a variety of gold-bearing rocks, including the quartz lenses, silicified schist and ankerite, and the mill treatment is essentially the same throughout all the mills of the lode. The ore is passed through rock breakers from which it goes to stamps, where it is crushed to pass a 30 or 40 screen—the height of drop, and of the discharge and other details of stamp mill practice varying but little in the several mines. Amalgamation is practiced both inside and outside the battery, the pulp going to various makes of concentrating machines. The sulphurets are either shipped to smelters or are roasted and treated by the Plattner chlorination process, as at the Rawhide, or by barrel chlorination, as at the Eagle-Shawmut, near Jacksonville. Cyanide is being tried in an experimental way on tailings at several mines. In all cases the saving is high, usually over 90%, by whatever method is employed, and it appears to be a case of relative economy of the several processes.

The Alabama mine, referred to in the last paper, has been idle some time, due to legal and other complications. It is stated that in the north drift of this mine rich ore was found before shutting down, but was not followed as it was going into the neighboring property, the Omega.

South of the Alabama is the Crystalline mine. The geological conditions here are similar to those of the Alabama. This does not always follow, for often within a few feet the geological conditions change to an extent which had not been anticipated.

The Crystalline mine has produced a large amount of gold from pockets as well as from milling ores, but seems as yet to have failed in finding a large and continuous body of pay rock, though the surface indications are favorable to successful deep development. South from the Crystalline mine is a small property (a fractional claim) known as the Gem, which has been worked in a small way and which has produced many thousands of dollars in gold from the greenstone schists forming the hanging wall country of the main vein, which outcrops on the hill back of the Gem workings. These schists are silicified and impregnated with auriferous iron sulphide, and free gold. The mine has been worked mostly by open cuts, which has made mining cheap. The mill has been run by a large overshot water wheel. This was a very common means of power along the Lode in the early history of mining there, some of the wheels built at that time being 50 to 60 feet in diameter, though the greater number were about 30 feet. In more recent years impact wheels, steam and electricity have almost entirely replaced the old-fashioned overshot wheels.

Whiskey Hill is an eminence beginning at Wood's creek, 1 1/2 mile south of Table mountain. This ridge is caused by the greater resistance to erosion of the continuous, unbroken outcrop of the Mother Lode. The serpentine and soft amphibolite schist being more quickly eroded than the quartz and dolomite, which form for most part the summit of this ridge—Whiskey Hill—noted for the large amount of gold

\*See illustration on front page.

taken from its surface and from pockets occurring in the hanging wall schists and slates in the early mining days. It is in this zone of schists that the Gem workings have been mostly made. The Trio mine lies west of the Gem and is located on the main lode. It has considerable development of a superficial character.

Two of the engravings on the front page are of El Rico mine, near Tuttletown, on the Mother Lode, and the third shows the usual method of delivering the heavy timbers at the mines.

(TO BE CONTINUED.)

## Mining and Metallurgical Patents.

PATENTS ISSUED SEPTEMBER 13, 1904.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

LOWER TUMBLER AND LADDER END FOR ELEVATOR DREDGERS.—No. 770,011; S. L. G. Knox, Milwaukee, and W. Ferris, South Milwaukee, Wis.

In lower tumbler mechanism for dredging machines, combination of hollow rotating tumbler shaft, brackets in which shaft is supported, removable caps on brackets, and tie rod passing through shaft and secured at ends between brackets and caps, whereby tie rod is rigidly held in place and brackets are held at fixed distance apart.

HYDROCARBON VAPOR BURNER.—No. 769,981; H. B. Cary, Los Angeles, Cal.

Gasoline vapor generator and injector consisting of enlarged flat head and elongated duct portion extending at right angles from one side thereof, parts being formed integral and head comprising circular face and shouldered rear portion, face forming shield and rear portion being provided with passage formed from limbs, each limb extending respectively from one shoulder to limb from adjacent shoulder, except last one, which terminates at point adjacent to first limb, plug in outer end of each limb, and jet piece, head of burner being of such area and thickness as to receive and retain enough heat from furnace as to produce constant vaporization, and duct portion being provided with three passages, one of which is larger than others and extends longitudinally entirely through portion and transversely through head substantially at center thereof, and other passages extend parallel with larger passage and terminate at inner ends, respectively, one with inner end of last limb of passage in head and other with first limb near its plug, and outer end of one of them communicates with jet piece in alignment with larger tube and other one is adapted to communicate with oil supply.

GOLD-SAVING APPARATUS.—No. 769,886; J. S. Bolinger, Cherokee, Cal.

Combination with riffled or like surface of submerged sections of foraminous material flexibly held

at one end adjacent to surface and arranged as perforate partition between finer sands and values and coarser material above. An arrester for undercurrent of water flowing thereover, comprising series of successively arranged flexible screen sections secured at upper ends to surface and approximately of same width as surface.

TILTING METALLURGICAL FURNACE.—No. 769,712; J. A. Potter, Pittsburg, Pa.

Endwise tilting furnace and regenerators located at opposite ends and registering with end ports, regenerators being movable toward and from port joints.

WELL-SINKING APPARATUS.—No. 769,727; M. T. Chapman, Aurora, Ill.

Combination with rotatable platform, of a pair of jaws mounted thereon, each jaw comprising endless chain, and support therefor consisting of block having groove in face, in which groove chain is adapted to move.

EXCAVATING APPARATUS.—No. 769,828; T. F. Moore, Syracuse, N. Y.

Excavator having its sides of greatest depth midway between ends and bottom extending from rear ends forwardly along lower edges of sides and terminating at lowest points.

CRUSHING OR PULVERIZING MILL.—No. 769,740; E. C. Griffin, Newton, Mass.

In mill of class described, grinding chamber containing annular die, overhead revoluble carrier, crushing roll, spindle operatively connected therewith, and fulcrumed on carrier, tubular shield surrounding spindle and mounted on carrier, lower end of shield opening into grinding chamber and its upper end opening through carrier, and means mounted on

latter and communicating with upper end of shield to collect and force downblast of air through shield.

RABBLE FOR ROASTING FURNACES.—No. 769,689; M. Corcoran, Anaconda, Mont.

In device of character described, arm provided at lower edge with lateral base flanges, carrier plate provided with flanges arranged to engage base flanges of arm whereby carrier plate may be slid upon arm, and blade and carrier plate being provided one with a guide and other with head adapted to engage guide, whereby blade may be slid into position in carrier plate.

CEMENT KILN.—No. 769,742; F. M. Haldeman, Alpena, Mich.

Cement kiln having hood removably attached thereto, hood and kiln being each provided with lining of firebrick or similar material, and gasket of asbestos or similar non-heat-conducting and non-fusible material between linings.

PROCESS OF EXTRACTING PRECIOUS METALS FROM ORES OR SLIMES.—No. 769,938; H. R. Cassel, New York, N. Y.

Process of extracting precious metals from ores by adding bromide and cyanide in solution to ore, and then passing chlorine gas through mixture to convert bromide into bromine and form solvents for precious metals.

THE cyanide process has now been in actual and successful operation for nearly fifteen years. It has been improved in many ways and its application much extended as the knowledge of the process grew. Improvements are constantly being made and intelligent efforts directed toward simplifying and cheapening its application, with a good show of success, so that in a decade from now, or in a quarter of a century from its first use, it will probably have found a much wider field of usefulness and successful operation. The field for improvement is broad, and other processes promise to make cheaply available the values in ores now considered either too low grade or too rebellious for treatment by existing methods.

THE first electric transmission plant for mining purposes in California was installed near Placerville, El Dorado county, for the American River Syndicate, when power generated on the American river was transmitted to the Dalmatia mill, near Kelsey, May 1, 1890. The electric plant was situated 1300 feet lower than the mine, a mile distant. The power was derived from 400 inches of water under a 112.5-foot head. The dynamo was figured at 126 H. P. The motor was situated in the mill and was belted to the main shaft of the mill and ran rock breakers and mills, etc.

# Mining Summary.

SPECIALY COMPILED AND REPORTED FOR THE  
MINING AND SCIENTIFIC PRESS.

## ARIZONA.

### Cochise County.

It is reported the Empire S. Co. at Benson has been reorganized as the Southwestern S. & R. Co., and will add a 200-ton water jacket furnace to its equipment.

J. A. Lewandowski of Douglas, engineer for the Savage G. & C. Co., operating at Paradise, says a smelting furnace will be put in.

### Gila County.

The water rights, rights of way, franchises, etc., of the Clark electric power proposition have been taken over by the Globe Power Co., which will start construction this fall. B. G. Fox of Globe is interested. The capacity of the plant will be 8000 H. P. A 30-foot concrete diversion dam will be built in Salt river below the mouth of Cherry creek. A tunnel 10 feet by 13 feet, 7015 feet long, will carry water through the mountains to opposite Redman flat, from which point a pipe line will cross Salt river, from where the water will be conducted by canal to the power house above Pinal creek. The water will have a head of 285 feet to the river bed. A substitution will be built in Globe, from which lines will be built to all parts of Globe district for distributing power to the mines. Specifications also provide for a dam 100 feet high above the mouth of Cherry creek. Two other reservoirs on side streams will also be built. It is said the Globe Power Co. will provide small electric hoists for rent to the smaller mine owners in order to increase development of the district.

### Graham County.

The output of the Arizona C. Co. at Clifton for August was 2,165,705 pounds of copper.

The Federal M. Co., operating the San Juan mine, near Safford, reports progress in development work. A 100-ton smelting plant will be built. J. F. Weber is manager.—The Michigan-Arizona M. Co., with headquarters at Safford, has been organized to operate mines in the Graham mountains, on which development work has been done. The ore carries gold and silver values. It is intended to sink a shaft to 1000 feet, after which levels will be run.

Work has been resumed by the Coronado C. Co. The company owns a group of claims in the Coronado mountains near Metcalf, adjoining the Coronado mine of the Arizona C. Co.

### Mohave County.

The Gold Roads M. Co., near Acme, last week shipped bullion valued at \$3800, taken out in two weeks' run of the mill.—It is reported that work on the Roosevelt mines, in the Gold Roads section, will be started up next week. The mines are owned by J. M. Day of San Francisco. The properties are said to have bodies of milling, gold ore.

W. Fellows, superintendent of the Hilty group of mines, near Kingman, is hauling in lumber and machinery for a hoisting plant.—F. Stull reports getting out ore in his lease on the Lucky Boy mine, near Chloride, and will make shipments. Storms caused several landslides to fill up the portal of the tunnel at the mine, which has been cleared. Stull is also working men on the Mocking Bird mine, near Stockton Hill, and is getting ore.

At Chloride the Philadelphia & Arizona M. Co. has sold its Minnesota-Connor properties to F. H. Griffith et al. Development work will be increased. The shaft on the Minnesota mine will be sunk 200 feet deeper. The mill will be run on tailings until the dumps are run through, when ore from the mine will be handled. Water will be piped from the Lucky Boy mine, after which a pipe line will be laid from the Merrimac mine to the mill and a pumping plant installed.

### Santa Cruz County.

The Tom Taggart group of mines, near the Wandering Jew mine, in Tyndall district, Santa Rita mountains near Nogales, has been bonded to E. L. Crowell et al. Operations have been started.

### Yavapai County.

It is reported the Silver Flake mine, near Prescott, will be reopened.—J. S. Jones, at Chaparral, is putting in an air compressor at his mines.

J. K. Truman of Phoenix has started development of a group of claims near Wagoner, near the Black Canyon road. He has a hoist set up and is putting in a pump. The ore carries gold and copper.

E. M. Clark of Groom Creek, owner of the Chicago mine, says he will build a mill.—W. W. Elliott is putting men on

the properties of the Mount Union Con. M. Co., near Prescott, to build a mill and other buildings. E. E. Greenwood is superintendent and manager.

### Yuma County.

W. W. Elliott of Prescott of the Amalgamated G. M. Co., operating at Quartzsite, says the company has sixty men at work building roads, grading the millsite and developing water. The mill will have 120 stamps of 1000 pounds each. Power will consist of 350 H. P. boilers and one 350 H. P. compound Corliss engine. The company has five eight-horse teams on the road, and will put on five more, freighting from Congress Junction, says Superintendent Meeks.

## CALIFORNIA.

### Amador County.

At the South Eureka mine, Sutter Creek, B. B. Haven superintendent and W. J. McGee manager, progress is being made on construction of the 20-stamp mill. Excavating is completed. The new mill is being built to the west of the present one and separate from the old building. It will also be operated with independent power.

### Butte County.

Near Oroville, San Francisco and New York men have leased the Sugar Loaf mining claim. Development work will be begun by Superintendent Page.

### Calaveras County.

Work will be started this week on the North Star mine, adjoining the Gold Cliff mine at Angels. This mine, with four others adjoining, has been taken by Eastern men, who will put in machinery capable of handling 200 tons of rock per day; a mill test of eleven tons of rock averaged \$4.20 per ton. J. Jacobs is superintendent.—The Beatrice mine, at Murphys, will be operated again, beginning Oct. 1, with R. E. Ober superintendent.

Work of extending the electric wires to the Marshall mine, near Mokelumne Hill, is about finished. Work in the mine has been delayed owing to the non-arrival of the pump. The company operating the Marshall mine is the California Gold Placer M. Co.

At the Black Wonder mine at West Point rock assaying \$60 per ton is reported opened up. There is a 5-stamp mill on the mine and at present operations are being confined to putting in additional machinery for full operations. The mine is operated by Moffitt & Sallee of San Francisco.—The south extension of the Black Wonder is being operated by A. J. Teeple of Mokelumne Hill.

### El Dorado County.

It is said final payment has been made on the Mameluke Hill mine, near Georgetown, and that the company expects to resume operations by October 1st.—The drainage tunnel at the Nigger Flat mine, Smith's Flat district, has been retimbered and reopened and work of unwatering the mine is progressing.—The Monte M. & M. Co., Gold Hill district, has started putting up a 10-stamp mill. The shaft in the lower tunnel is 60 feet in depth and is said to have developed an ore body.

The Landecker G. M. Co., which has bought the Landecker property, is working thirty men. They have completed top buildings and grading for the mill and retaining walls is completed. The lower drain tunnel of the mine, which is near Placerville, has been driven to the pay channel, showing workable gravel.

The Short Handle mine, in Spanish Dry Diggings, near Placerville, which has not been worked for several years, will resume operations.—It is reported gravel yielding 25 cents a pan has been struck in the South Slope gravel mine, owned by Bosquit et al., of Placerville.

Two boilers and a steam pump are being set up by El Dorado C. M. Co., and work on the triple-compartment shaft at the Eureka gold quartz mine in Georgetown will be resumed. The shaft is down 200 feet.

### Humboldt County.

G. A. Waldner of Eureka, president of the Big Bar M. Co., operating the Big Bar placer mine on the Klamath river, 6 miles from Orleans, reports mining is being increased. The flume is being repaired. F. Road is superintendent.

### Mariposa County.

The Mount Gaines mine, above the Hornitos G. M. Co., is developing and milling ore from the Barfield mine. A 5-foot Huntington mill crushes the ore.—At the Grimshaw, the shaft is down 150 feet. The mine is under bond to Bierce & Rhodes of San Francisco.

On Bear Valley mountain, near Hornitos, on the Homestake mine the tunnel has been driven 100 feet by the Hornitos G. M. Co., and 700 feet more will be run.—At the Exchequer mine, Superintendent M. O'Brien reports development progressing. The mine is at the mouth

of Cotton creek, 7 miles north of Hornitos on the Merced river. There are seven claims in the group, says the Gazette-Mariposan, and the main ledge crosses the river and can be worked by tunnel from either side. A mill run by water power will be built. The mine is owned by the Exchequer G. M. Co.

### Mono County.

The White Mountain M. Co. has been incorporated at Salt Lake City, Utah, by E. W. Clark, president; F. Pierce and W. J. Barrette. The company owns ten silver lode claims in an unorganized mining district in Mono county.

### Placer County.

The Three Star mine, near Auburn, is again in full operation, says Superintendent B. F. Hartley, after repairs to the pipe line.—The Baltimore mine at Forest Hill is running with a few men opening up the ore bodies, says Superintendent Vestal.—About thirty-five men are at work putting in the dam for the Eagle Bar M. Co. at Channel Bend.

There are seventy men working at the Cash Rock mine, near Forest Hill. They are nearly down to bedrock. This is a river mine and they cannot work after high water arrives.—Twenty men are at work driving the tunnel at Peckham Hill. They are also putting the tunnel ahead at the Seller mine and expect to break through next week.

### Plumas County.

E. C. Robinson of Oakland, part owner of the Morning Star group of mines in Granite Basin, near Quincy, says the Trenton M. & M. Co. has been incorporated to work the mines this winter and will sink a shaft on the Morning Star, which is 86 feet below the water line, to 286 feet from surface. From shaft they will drift 500 feet.

### Riverside County.

The United States Tin Co. is operating the "Temescal" tin mines near Corona. Machinery has been put in, and concentrating tables are treating the tailings dumps. The company is working under a twenty-year bond, on a royalty basis.

### Sierra County.

The Mabel Gravel M. Co. has been incorporated to operate in Sierra county, by J. W. Morrell, J. M. Haskins and J. H. Patterson of San Jose, and J. M. Walling of Nevada City.

### Shasta County.

The Mammoth C. M. Co., composed of A. F. Holden of Bingham, Utah, W. H. Coolidge, R. D. Evans, E. A. Clark et al. of Boston, Mass., having bought the Mammoth group of copper mines, near Kennett, has development work under way. The company will build a smelter. J. Filius of Redding is local agent.

W. A. Albertson, superintendent of the Clover Creek Quicksilver M. Co.'s cinnabar property on Clover creek, northeast of Redding, reports another 10-foot body of ore has been opened in the mine. The ore is high grade. The main vein in the mine is 50 feet in width.

In South Fork mining district in western Shasta county, near Redding, a custom smelter will be built on Clear creek by the Redding G. & C. Co.

### Slakiyou County.

(Special Correspondence).—The Medina G. M. Co. of Tacoma, Wash., has fifteen men at work developing a group of six claims near Oro Fino. The ledges average 2½ feet in width in diorite. These ledges were uncovered by hydraulics in working the Scott gravel mine. The main ledge courses through three consecutive claims. The longest tunnel is in 250 feet and the breast 200 feet below surface. The lower tunnel when at this point will have backs of 250 feet. Near mouth of lower tunnel a steam hoist is being put up and a shaft will be sunk. The 10-stamp mill, remodeled, is run by water power. The ore is free milling so far and increases as a base proposition as depth is gained. It yields average milling value of \$10 per ton in gold. Further development will be done to find advisability of a concentrating or a cyaniding plant. The officers of the company are: C. Saunders, Northampton, Mass., president; I. A. Towne, Tacoma, Wash., and G. W. Addison, at the mine, manager.

Near Oro Fino, A. D. Cameron of Seattle, Wash., has a bond and lease on three claims through which run three ledges. He will increase development work and next spring will build a mill.

Oro Fino, Sept. 20.

(Special Correspondence).—The Sheba mine, on Patterson creek, consisting of 200 acres, and lately owned by the Patterson Creek G. M. Co. of San Francisco, has been taken over under lease and bond by C. J. Fry et al. The general formation is granite and porphyry, with ledges 10 to 20 feet in width. The ore is free milling with sulphides and averages \$10 gold per ton.

The main shaft is down 200 feet. Under C. J. Fry's management a new ore body has been opened. The milling plant is of ten stamps and two Frue vanners. Work will continue during the coming winter.

Ore is being opened up in the Boston quartz claims, 4½ miles from Yreka. The claims are owned by W. B. Shearer and R. M. Brown of Yreka and J. W. Berry of Gazelle, with Brown as manager. The ledges are 4 feet in width and the pay ore a free-milling ribbon quartz with assay values of \$40 per ton. Open cuts for 3000 feet along apex of ledge are said to show same grade of ore.

The Mabel group of two claims is on the divide between Mill and McKinley creeks, 6 miles northeast from Scott Bar. The general formation is slate and limestone; the vein matter is 2½ feet in width of white, sugary quartz, iron stained, with free gold showing. Values are also carried in high-grade sulphurets, both iron and galena. Developments are by tunnels driven in from McKinley and Mill creek sides—one in 300 feet, others 150, 75 and 80 feet, respectively. The Columbia is another claim, owned by Fisher of San Francisco, under lease to owners of the Mabel group. A crosscut tunnel on that claim crosses the side line of the Mabel and taps the ledge 300 feet below surface. On the Columbia is a 5-stamp mill, and 100 tons of Mabel ore treated gave return of \$16 per ton in gold. The Mabel group is owned by A. J. Timmons of Yreka and is under management of J. Chase.

J. Ironsides, superintendent of the Cherry Hill mine, says he is doing development on his own property adjoining. In the 700-foot tunnel he has a 40-foot winze in free-milling quartz, with values of \$30 per ton in gold.—On east fork of Deadwood creek is the Opal group of three claims, owned by Sacramento and Nevada City men. The ledges are in slate, being ribbon quartz, mineralized, with 7% sulphurets. The concentrates assay \$350 per ton. The average value of the ledge matter is \$22 per ton in gold. A crosscut tunnel taps ledge 170 feet below surface. Drifts on the ledge amount to 1200 feet. A mill has been built and five stamps with concentrating table are being placed. C. J. Bryant is manager and has twelve men employed.

Yreka, Sept. 21.

At the Drummer Boy mine, near Yreka, formerly worked by a Mexican horse arrastra, F. W. Mahler, owner, says he has developed a vein of ore 25 feet wide, in its lowest tunnel, with a high grade vein of quartz, 2 feet on either wall, of average value of \$18 per ton, and has 175 feet of backs from the tunnel. He also has 1000 feet of drifting and raises, and three levels with ore in sight, and will build a mill and concentrator.

L. C. Monahan of Redding is opening up a quartz ledge at Cecilville, in Salmon river section, and says he will put up machinery.

At the Mount Vernon mine, at the headwaters of Greenhorn and Cherry creeks, which is being opened up by the Mount Vernon M. Co. of Spokane, Wash., Superintendent Lane says he has 385 feet of backs developed and expects to have 685 feet by spring. The vein averages 20 inches wide. An electric plant has been put in to run a sawmill that is cutting lumber for a 10-stamp mill. The buildings and the mine will be lighted by electricity. Superintendent Lane has twenty-five men on the payroll.

### Trinity County.

W. & W. Valentine expect to erect a stamp mill on their mine, near Deadwood. They have two ledges, one being 12 feet wide and carrying payable values. The other is smaller, but higher grade.—G. Simmons has a lease on the Fox & Francks mine and has put up a Huntington mill and will start crushing ore this week.

The Haas mine at Junction City has been sold to J. Elliott. Owing to lack of water, it could be operated profitably only during winter and spring months. Elliott intends putting hydraulic equipment on the Haas.—W. Montgomery, superintendent of the Bobs Farm M. Co., which has bought the Mountain Boomer mine at New River, reports work increasing.

J. G. and G. Lorenz are working their mine on Grizzly creek, near Weaverville. They have put in a sawmill and will further open up the mine.—The Lappin Co. is putting in a 5-stamp mill at its mine. The company is also running a lower tunnel to tap the ledge below the old works, so as to do away with the pumping plant.

W. M. Stover, who has bought the Unity mine at Minersville, reports work progressing. He has men cleaning out the ditch and will dig 1½ mile of new ditch.

### Tuolumne County.

C. Wagner has a five years' lease on the Stanislaus gravel mines Nos. 1, 2 and 3, covering 480 acres, near Columbia.—

Bond has been given to E. Knickerbocker, G. W. Thompson, T. Nagle, T. Harris and B. Jennings of San Jose on the Emma K., O. K., Electric and Thunderbolt claims, near Confidence, for \$10,000, payable within three years. They are to pay 25% of the gross output of the mines, which will apply on purchase price.

The Big Oak No. 1 (the Moody) mine, near Groveland, is being unwatered by Superintendent D. S. Tyer for Tait & Roper of New York, who have a bond on the property.

Work has been suspended at the Altadena mine, near Columbia, the pumps have been pulled out and the property abandoned.

The Jumper and Golden Rule mines at Stent are doing development work preparatory to extending workings when the heavy rains come. The properties are owned by the Jumper Gold Syndicate, with M. B. Kerr manager. The Jumper mill is dropping thirty stamps of its sixty, with R. E. Eampson as mill foreman.—The Santa Ysabel mine is working three shifts, sinking a shaft, with E. C. Loftus as superintendent and manager.

The Rawhide mine, near Jamestown, is reported closed down due to shortage of water.

## COLORADO.

(Special Correspondence).—The Interstate Commerce Commission, at a meeting here the past week, elicited testimony introduced showing that the freight rates made by the various railroads entering the city are much higher than to any other point for the same class of goods. Denver has brought pressure to bear and the Commission has heard the charges. On certain classes of mining machinery the rate from Chicago to Salt Lake City is about the same and in some cases less than from Denver to Salt Lake.

Contracts for the big tunnel to tap the Gunnison river, to irrigate a large section near Montrose, will soon be let. This tunnel work will require several years for completion.

About \$14,000 have been distributed to the families of the miners who were killed and maimed in the Independence depot disaster on June 6th. This amount was subscribed by citizens of Cripple Creek district, illustrating the general disposition of mining men.

Efforts are being made to have the convict Romaine, now serving sentence in the Kansas Penitentiary, pardoned, that he may be brought to this State for trial on the charge of blowing up the Independence depot, near Victor, June 6th. He has confessed to the crime and implicated several others.

Papers have been filed with the Secretary of State of the Red Mountain Railroad M. & S. Co., with a capitalization of \$5,750,000. Headquarters of the company are Phoenix, Ariz., and Philadelphia, Pa. Denver, Sept. 19.

Denver reports say the American S. & R. Co. has made a reduction in its prices for treating ores, which will enable low-grade ores to be treated at the local smelters and will result in treatment of ore that is now thrown on the dump. The Colorado & Southern railway has made a reduction in its freight rates from Georgetown, Central City and intermediate points, and the miners in Gilpin, Clear Creek and Boulder counties will increase output. H. Lyne at Denver, acting manager of the smelter, says the object in making the reduction was so the smelter could secure a large supply of quartz. Quartz is needed in smelting, and because so much concentration work has been done of late years the ores having large quantities of quartz were not sent to the smelters. The output of the mines within a radius of 100 miles of Denver is expected to be doubled because of the low smelting and freight rates. The new rates went into effect Sept. 20, and are: For ores of gross value of \$10, \$4 per ton smelting charges; ores giving from \$10 to \$18, \$5 per ton; ores of gross value of from \$18 to \$25, \$6 per ton smelting charges. Sulphur and silica in the ores will not be taken into consideration. Zinc will cause an extra smelting rate. The Colorado & Southern has made a rate of \$1.25 from Georgetown and other places of equal distance.

### Boulder County.

The F. J. K. group of claims on Woodland mountain, near Eldora, has been sold to Boston, Mass., and Pennsylvania men, who have incorporated under Colorado laws as the Woodland M. Co., with J. R. Campbell of Eldora as president and manager. Work will begin this week on the development of the mines, which are favorably located for working by tunnel.

### Clear Creek County.

Idaho Springs reports say work is progressing on the excavation for the addition to be built on the Bertha mill. The capacity will be doubled. G. W. McClanahan of Booneville, Mo., interested in the

Bertha Co., is superintending operations. Increase in the capacity of the mill will allow treatment of 100 tons of ore daily. They are adding two Kinkead mills, two batteries of rapid drop stamps, two Gilpin county bumping tables and two Wilfleys. Manager J. H. Eaton of the Dives-Pelican and Seven-Thirty properties, near Silver Plume, says a larger air compressor will take the place of the one now in use at the Burleigh tunnel. Additional drills are being put in.

The electric power line to the Stevens mine, near Silver Plume, is completed and the transformers are being set up. The motors and other equipment are ready for operation.

R. C. Vidler, manager of the Transcontinental M., M. & T. Co., operating properties in East Argentine district, near Georgetown, reports negotiations under way for transfer of one-half the company's holdings to an English company for \$1,000,000. The Vidler tunnel has been driven 600 feet and has, so far, cut seven veins carrying payable ore.

### Dolores County.

S. Larson, manager of the Horlick group of mines at Dunton, reports indications in the Horlick group of mines encouraging. He is working twenty-five men on development and is driving several tunnels. At 1400 feet below the mine is a 10-stamp mill, being used at present for sampling the ore. Its capacity will be increased. The mill will be connected with the mine by a wire-rope tramway 1400 feet in length. The company generates its own electricity.

### Gilpin County.

An air compressor has been put in at the King mine on King flats, near Central City, by the Nevada Con. G. M. & M. Co., and developments are being increased. Crosscut is being driven south on third level to cut a known ore body on the Lamberson & Warren property. T. Cornish is manager.

The Fairfield M. Co., operating the Fairfield mine at Russell Gulch, has partially suspended development to put in an air compressor. Several lessees are at work and are taking out ore.

Sinking operations are being carried on by the Newfoundland G. & S. M. & M. Co. at the Newfoundland shaft on Gunnell hill, near Central City. The shaft is down 690 feet, says Manager G. W. Mabbee. The ore bins are being filled for test shipment of 100 tons to the Rocky Mountain concentrator at Black Hawk. An addition has been made to the main shaft building.

The Peterson slow-drop stamp mill at Gilpin is being run on ores from the Gold Dirt mine and an average of twenty tons is being treated daily. The mill has been leased by the Gold Dirt M. Co. and they overhauled it. G. Williams is in charge. The Gold Dirt Co. intends to experiment this fall with cyaniding the tailings. Two four-horse teams are hauling ore from the Gold Dirt mine.—The Proconier mine in Hawkeye district has been leased and bonded to E. H. Jeffries for one year for \$25,000, and the lessee will sink the shaft and drift.

The Cashier G. M. & R. Co., operating the Pittsburg mines, near Russell gulch, is shipping smelting ores which give values of \$170 per ton. The company will put in a hoisting engine of 60 H. P. capacity and will sink the main shaft 200 feet below present depth of 620 feet. B. L. Campbell is superintendent.

Operations have been started by the Protective G. M. Co. on the Saratoga West and Ridge mining claims west of the Saratoga, near Central City. C. Heselbine of Denver is manager. Work of retimbering the Ridge is under way. The company intends to sink the shaft another 100 feet and will put in a steam hoisting plant.

The Pyrenees and Nimrod group of mines on Quartz hill, near Central City, will be operated by the Pyrenees-Nimrod M. Co., which has been incorporated with E. B. Wilson, Minneapolis, Minn., president; F. F. Reed, L. E. Tobias; manager; J. Moynahan of Idaho Springs. They have unwatered, cleaned up and prospected the workings to determine condition of the property, the work being done on the Nimrod where there is a shaft down 600 feet. Shipments will be started and machinery will be installed on the Pyrenees which is 100 feet west of the Nimrod shaft. The Pyrenees shaft is down 850 feet and it is intended to make that the main working shaft of the group.

### Gunnison County.

The Standard M. I. Co., controlling the Augusta Metal M. Co. and the Black Queen G. M. Co., is mining in Crystal in the northern part of Gunnison county, near Camp Pittsburg. The Augusta and Excelsior tunnels are opening up the ground. The Augusta Metal M. Co. has extended its tunnel in on its group of twenty-six lode claims a distance of 3000

feet. The main Augusta vein, for which the tunnel was driven, was cut at 2854 feet at a vertical depth of 1420 feet. The vein is 15 feet across. The company has drifted on it for several hundred feet both ways. But little ore has yet been taken out. The ore is galena and carries gold. The company expects to make heavy output when it completes plans of development under way, and will equip the property with machinery. A larger compressor will take the place of the one which has been in use for three years. Other improvements are to be made in the power plant, says Manager T. O'Brien. A tramway system will connect the mine with the mill. The tram will be 2 miles in length. The milling plant will be of 100 tons capacity.

The Red Jacket mine, at Pitkin, was started up last week by a new company, with J. Grant in charge. A plant of machinery is on the property.

At Whitepine the Erie M. Co. will build a zinc mill this fall.

### Hinsdale County.

The Adelia M. Co. has been incorporated by J. Uglow, W. Mendenhall and G. D. Bardwell, of Lake City, to operate a group near the Isolds mine, in Burrows Park district, south of Lake City.

The Handies Peak G. M. & M. Co. has been incorporated to carry on mining operations in Hinsdale county. Its principal offices will be in Denver. The incorporators are F. H. Sprague, S. T. McDermitt and R. R. Bollinger.

### Lake County.

Leadville reports say the Bohn shaft, on lower Carbonate hill, will start up this week and sink deeper, the Coronado and the Penrose shafts having drained this section, and there will be no difficulty in getting down to the required depth. On Rock hill the Bessie Wilgus mine, near the Dome and Rock claims, has resumed. It is owned by T. B. Wilgus of Morgantown, W. Va. Machinery is being placed. Sinking will be started.

Leadville reports say a strike has been made by J. F. and G. Campion, owners of the Reindeer mine, on Rock hill. A body of lead carbonate that measures 150 feet through has been uncovered for 1100 feet. The ore body is thought to be a continuation of the old Dome shoot. Ore is being shipped to smelters without sorting and nets \$20 a ton.—The New Monarch M. Co., on Little Ellen hill, is operating three shafts and blocking out ground. Two more boilers, 200 H. P. each, are in place at the New Monarch and sinking will resume. The present depth of the shaft is 800 feet, and at bottom bodies of oxidized ore have been opened. The shaft will go under that and get to the sulphide zone. At the Cleveland the shaft is being sunk and is opening up lead sulphides. The gold-bearing quartz ore is being kept separate as it comes from the shaft. A railway spur is being built to the shaft.

Work on the reduction plant at the Yak mine at Leadville is progressing, and the mill will be completed before winter sets in. The mill is being built to treat zinc ores by concentration.

### Larimer County.

The Le Bar Oil Co. has abandoned its well on Box Elder creek, Douglas, near Fort Collins, after attaining a depth of 2625 feet. Four sands were found, all of which contained oil, but so flooded with water that none of them would produce in paying quantities.—The Douglas Oil Fields Co. has sold its entire holdings to an English company headed by R. O. Hilliard of London.

### Ouray County.

The Treasury T., M. & R. Co., at Red Mountain, has started building a stamp mill. Excavation will be made for a 100-ton plant, but for present machinery will be put in for fifty tons daily.

More men are being put on at the Ouray Chief mine at Ouray. The shaft which is down 100 feet will be sunk to the contact at 300 feet. In bottom of shaft is a body of high-grade ore. Stopes and drifts will be worked by hand and later machine drills will be put in.

### San Juan County.

The Silver Wing mill above Eureka, on the Animas river, will be overhauled and put in operation by M. Schmelzer for the Eureka Exploration Co. that has 1000 tons of ore mined at the Silver Wing mine near the mill and has ore at the Frederica mine 2 miles from the mill. The mill has capacity of fifty tons a day. Extension of the Silverton Northern Railroad, and a short tram line connecting the mill with bins beside the track, will be built.

The Galty Boy group of seven claims has been sold to T. Ross et al. of Waynesburg, Pa., for \$40,000. The Galty Boy group is in Dry gulch, 1 mile from Cement creek, near Gladstone.

Negotiations are reported pending for sale of the Kendrick-Gelder smelter, at

Silverton, to the Red Mountain Railway Mining & Smelting Co., of Red Mountain. This smelter is said to be adapted to treatment of the heavy sulphide ores of the Red Mountain country.

Daily shipments from Silverton average seven cars of ore and concentrates, says the Silverton Standard. The incoming freight, of coal, lumber, machinery, merchandise, etc., also averages seven cars daily.

### Summit County.

Superintendent C. A. Finding says the Mountain Pride mine on Baldy, near Breckenridge, will resume operations.

### Teller County.

Lessees Wright & Co., operating the Zenobia claim on Bull Hill, at Victor, owned by the Stratton estate, report sending out ore averaging two ounces gold per ton. The ore is mined from the 900 foot level, 550 feet north of the shaft, where the vein averages 5 feet in width. They are shipping a carload per day.

Whiting & Co., who have a lease on the Bluebird dump, near Cripple Creek, are shipping two cars of ore per day, and will double the tonnage. They have put in machinery, including a 15 H. P. electric motor, with which the ore is raised on a tram car from the dump to a height of 80 feet. By gravity the ore passes through screens, through a spray washer and then into the bins and tanks. The ore is giving returns averaging \$15 in gold per ton. It is estimated that there are 20,000 tons of rock in the Bluebird dump.

Seven sets of lessees are operating on the Prince Albert group on Beacon hill, at Victor, and all have ore. Two other operators have been granted a prospectors' license. The company will deepen the shaft an additional 200 feet. This will open the ground to a depth of 450 feet.

Work will be resumed in the Moffat tunnel, which is in over a mile and in its course penetrates Gold and Raven hills. Its destination is a point on Bull hill below the Victor mine. A number of properties may be reached from the adit. Operations will be under direction of J. M. Parfet, manager.—Production at the Zoe mine, on east slope of Beacon hill, has begun by Nichols & Co. A 4-foot body of ore is opened at depth. Values run \$30 per ton.

## IDAHO.

### Bannock County.

W. R. Kivett of Boise says in Lava Creek mining district, near Arcola, he has bought a group of twelve claims and will develop the ground. Equipment will be put in.

### Boise County.

W. H. Simpson of Boston, Mass., has bought at Pearl the Mather claim, near the Black Pearl mine. It has been developed by a tunnel. At Marshall lake, in Idaho county, he has also bought the Big Dutchman group of seventeen claims.

### Elmore County.

M. M. Johnson, mine manager of the Newhouse M. Co. of Salt Lake City, Utah, reports having an option on a group of gold-bearing mines at Atlanta. Developments at depth of 400 feet on the ledge show a width of 7 feet between walls, averaging \$15 per ton. A mill will be built in the spring.

N. L. Raber, manager of the Canton G. M. & Dredging Co., operating on Snake river at Glenn Falls, near Glenn's Ferry, says a new dredger has been completed at a cost of \$55,000. It has a capacity of handling 2000 yards of gravel daily.

### Idaho County.

F. J. Conroy of Nampa, manager of the New Century M. Co., operating in Black Warrior district, reports forty men at work, building a road, by which to take in mining and milling machinery. Gold ore is being opened up in Mammoth No. 2 of the company's group.

G. L. Hedges, manager of several mines at Buffalo Hump, reports he has bought the Lone Star group in the Four Mile country, 20 miles north of Hump. The Lone Star has a porphyry dyke 300 feet wide which Hedges says will average \$4 per ton in free-gold values. It can be worked by quarry system. Supplies are being taken to the mine.

The Hogan mine, near Elk City, says G. L. Hedges, proposes to increase the mill from 20 to 100 stamps. They will put in a cyanide plant. They report making a profit of \$1 a ton on the ore. Treatment costs 80 cents a ton.

### Nez Perces County.

Culdesac reports say deposits of aluminum ore (presumably bauxite) have been found near the brick plant north of Culdesac. It is said the organization of a company is under way to develop the land held by the brick company and to arrange for extracting the aluminum values.

**Shoshone County.**

O. Gorke et al. of Chicago, Ill., of the Gold Dollar M. Co., owning placer and quartz properties in Pierce City district, near Greer, have an option on the Rose quartz mine for \$40,000. The company is operating its placers and proposes building a 20-stamp or 30-stamp mill for the quartz property. The Gold Dollar Co. owns the Chicago-Pierce placers, covering 320 acres.

Low water in the streams is reported affecting the mining companies in the Cour d'Alenes. At the Morning mine at Mullan there are but forty-five men at mine and mill, over 200 employees being laid off last week on account of lack of water. The mill is closed down. Operations will not be resumed until the rains have raised the creeks. This may not be before October 15. The Black Cloud mill has suspended operations, due to low water in Nine Mile creek, and ten men are employed where there were thirty on September 1. The low stage of water in Canyon creek is causing trouble with the tailings at the Mammoth and Standard mills. There is insufficient water to carry the tailings far away, which has caused the channel to fill up and the water to spread. The Federal Co. has men at work attempting to keep the water in the channel.

A consolidation has been made by which the Bernier and Flynn groups will be worked through the lowest tunnel level of the Frisco mine at Gem. The Bernier group adjoins the Black Bear, which is part of the Frisco group, and the Flynn group lies in line and southeast of the Bernier group, extending to the summit of the divide between Canyon creek and the South Fork. The Frisco tunnel, beginning at the mill, extends several thousand feet, reaching into the Black Bear claim. This consolidation gives 5000 feet in length of unopened ground. The Black Bear Fraction, of the Bernier group, has ore in the upper workings carrying values in silver and lead. The Frisco tunnel extended will come under that ore body at vertical depth of 1400 feet. Extended to the east limit of the Flynn group it will reach a depth of 2500 feet. D. M. Hyman, owner of the Frisco mine, P. Bernier and F. Burbidge, of Spokane, Wash., are principal owners. The consolidation will be incorporated.

The main shaft on the mine, so that cars from the mine will run the ore direct from the cage to the ore bins in the mill. The mill will also be near the tunnel development.

On Miller mountain, near Weiser, the Magnolia Co. is operating its 5-stamp mill and has cut the ore shoot in its tunnel at a depth of 165 feet from surface. The ore is free milling.

On Little Goose creek, 4 miles east of Meadows, the Rock Flat M. & M. Co. is developing a group and reports opening up a 45-foot ore body. The management expects next spring to build a 100-ton cyanide plant at mouth of the tunnel. The company has been incorporated by A. H. Butler, D. C. Blake, S. H. Coon, W. E. Webb and C. W. Merritt of Meadows.

The Hunter mill at Mullan is being overhauled and improved machinery put in under direction of W. A. Bradley. Development work continues in the mine.

The electric power line for Larson & Greenough's compressor plant at mouth of Grouse gulch is reaching completion. The addition to the compressor plant is under cover and ready for the machinery. Another flume line has also been built from Rock creek to the compressor with 150 feet fall.

A company has been incorporated by T. W. Clayton, G. E. Miller, D. Keith, J. W. Phillips and E. G. Soule of Spokane, Wash., and A. J. Prichard and S. V. Osburn of Osburn to operate the Evolution group below Osburn.

**Washington County.**

The Flat Rock M. & M. Co., Ltd., has been organized by A. H. Butler, D. C. Blake, S. H. Coon, W. Webb and C. W. Merritt. The ground owned by the company comprises the B. B. B. placer and other claims near Meadows. A crushing plant and a cyanide tank will be put in. Fifteen men will be put to work.

Manager C. F. Macey of the Iron Springs M. Co. says he will build a cyanide mill on the company's mines at Iron Springs, near Council. Foundations are laid. The saw mill owned by the company is getting out lumber for the mill. The reduction works will be located below

**KANSAS.**

**Cherokee County.**

At Galena the pumps on the Windsor ground have been repaired and are unwatering the workings. Four pumps are going and it is estimated 25,000 gallons a minute are being thrown. The Murphy pumps were also started to drain the ground there. On the Southside ground

24,000 gallons were being pumped when the water was "beaten" at the 94-foot level, at which the miners are working. Boughton Bros. have started up the Victoria mill. Jeffries & Co. will put in an 8-inch pump on the Wyandotte ground.

**MICHIGAN.**

**Houghton County.**

Houghton reports give the copper output of the Lake mines for August as follows:

Mines.	Tons.
Quincy	1,306
Atlantic	324
Mohawk	189
Michigan	171
Franklin	350
Winona	40
Adventure	115
Baltic	788
Tricontinent	635
Copper Range	1,823
Champion	800
Oscoda	1,210
Wolverine	506
Massachusetts	105
Centennial	150
Columet & Hecla	3,390
Tamarack	410
Isle Royale	105
Phonix	80
Abnbeck	29

Increase is shown over the output for the corresponding month of 1903 by all except the Winona, Wolverine, Massachusetts and Isle Royale.

**MISSOURI.**

Joplin reports give the output of the Missouri-Kansas-Arkansas lead-zinc district for the thirty-seven weeks of 1904, ended September 16, at 365,921,870 pounds of zinc, valued at \$6,097,810, and 46,194,990 pounds of lead, value, \$1,257,790. Both metals show an increase of about 5,000,000 pounds in quantity over the same period of last year.

**Jasper County.**

J. J. Luck is building a mill on the Horton land at Webb City and expects to have it ready for operation next month; an air compressor is also going in.—L. M. Janes is building a mill at Hard Shaft on the American Cornfield lease. The mine and mill are owned by the Fullerton M. Co.—The New Hope mill, being erected by J. J. Luck et al., is progressing. They have developed a sheet of zinc ore at depth of 200 feet. Six drill holes have been put down on the lease, which includes 123 acres, and all are said to show same run of ore.

The Baker mine in Central valley, near Joplin, has been leased by G. H. Davis and will be operated by the Ozark Lead Co.

**MONTANA.**

**Gallatin County.**

Bozeman reports say A. D. Sheridan and G. Whitney, near mouth of Leverick canyon, made a strike of copper showing a vein 12 inches which assays 13% of copper and \$13 in gold. They have also struck a deposit of magnetite, with a trace of gold. The Bozeman C. Co. has been incorporated to develop the property by A. D. Sheridan, G. Whitney, M. L. Rickman, J. T. Mitchell, C. O. Daggett, W. J. Killiam and R. A. Blackall of Bozeman.

**NEVADA.**

**Esmeralda County.**

The Kinkead-Goldfield Con. M. Co. has been incorporated to operate mines in Esmeralda county, and owns a group of fifteen claims near Kinkead, 12 miles east of Hawthorne. Ore has been taken out assaying \$15 in gold. A mill will be built. The mines are 3 miles north of the railroad track; water can be procured by sinking in the basin near the mines, says the Hawthorne Bulletin.

The Goldfield Great Bend M. Co. has been organized in Salt Lake City, Utah, to operate the Great Bend group, near Diamondfield, in Goldfield district. The officers are F. A. Keith president, F. B. Cook and P. Porter.

The New York-Tonopah M. Co. has been reorganized as the New York-Tonopah Con. M. Co., and will resume operations. The New York-Tonopah is equipped with a hoisting plant.

**Lincoln County.**

The bond of the Good Hope M. Co. on the Good Hope mine at Searchlight has reverted to the owners, G. F. Colton et al. Operations will continue under Superintendent T. L. Henderson.

The cement blocks for the ten additional stamps in the Quartette mill at Searchlight are in. Other improvements will be a larger hoist and enlarging the electric plant. The hoist will be 60 H. P. and the electric plant will have a total of 90 H. P. F. J. Harrington is superintendent.

Smith Bros. and Ryan Bros. of Caliente, owners of the Hope and Jackson mines west of Caliente, will resume work on the claims. There are 380 feet of development work on the Hope in a shaft sunk on a ledge 3 feet wide, carrying values of \$13

in gold, silver and copper. There is a 5-stamp mill and abundant water for treatment of ore. A good wagon road runs from the mines to the railroad. A ledge of cinnabar has been struck 3½ miles north of Caliente.

J. Foley, owner of the U. S. group of free-gold claims near Virgin river, 23 miles south of Moapa, reports striking a ledge in his 200-foot tunnel 4 feet wide, with ore assaying \$160. It is coarse free gold in honeycomb, quartz in lime and porphyry. He says he will build a mill.

Well drilling machinery is being set up by the Southwestern M. Co., says C. Gracey, superintendent, at El Dorado canyon. A well will be drilled at the Wall Street mine, owned by the company, to obtain water and to prospect the vein at depth. The mine is some distance from the mill, and if water can be obtained in quantity it is expected a reduction plant will be built at the mine.

**Nye County.**

C. E. Knox, president of the Montana-Tonopah M. Co., operating at Tonopah, in his report for the past fiscal year says ore of value of \$3,162,655 is awaiting reduction. The ores exposed are divided into two classes. Of the first class there are 14,166 tons of net value of \$98.25; of the second class, 70,834 tons of net value of \$25; these deductions being based on results derived from sales to the smelter. During the year the management opened up 4828 feet of ground, with a total of 7337 for the two years since opening the mine. Of this a large percentage was in ore, one drift extending 200 feet along strike of Macdonald ledge, which has maintained average width of 12 feet. From ores sold during the year there was derived \$201,000; shipments, however, having been confined to actual working requirements, while in July, after an all-rail outlet had been assured, production was practically suspended. On September 7, after delays by washouts, shipments were resumed. The crosscut on the 765-foot level is advancing. A new shaft will be sunk 500 feet north of the present one, and will connect with the Macdonald ledge, 970 feet below surface, while a recent development in the North Star shows ore in the Montana's south ledge, 150 feet below the 765-foot level in the Montana. D. B. Gillies, of Butte, Mont., is manager and superintendent.

At Tonopah, F. W. Hunter of San Francisco, Cal., has bought the Z and Colleen Bawn claims adjoining the Red Rock claim of the Pittsburg-Tonopah M. Co. on the west, and a company will be incorporated and development work started.

The drifts from the 60-foot level of the Lucky Baldwin mine at Gold Mountain are opening up ore. R. T. Brodek, manager, is having trial crushing at the mill of the Tonopah M. & Dev. Co. The engine has been repaired and the 10-stamp mill resumed crushing leasers' ore. Since starting up the mill has turned out 146 bars of bullion weighing 200,296 ounces, of a total value of \$100,000.

**Storey County.**

Thirty-one mining companies, composing the Comstock Pumping Association, have contracted with the Truckee River General Electric Co. for additional power, giving the mines two systems of supply, which can be used singly or together as required.

**Washoe County.**

Gold is reported found on bedrock at the reservoir being built by the Hunter Creek W. Co., 2 miles southwest of Reno.

The Springfield-Nevada M. Co., at Olinghouse, near Wadsworth, proposes putting in more mills, and will either arrange to utilize supply of water of winter, spring and early summer or take in water from Fort Defiance. In the former they will be limited to a nine months' milling season, at capacity of 100 to 150 tons per day, while a continuous run is possible with water from Fort Defiance. Superintendent J. D. Poole thinks the company will then be able to bring the cost of ore treatment down to \$1 per ton. There are several deposits of ore that carry \$4 per ton in free gold.

**White Pine County.**

The Pilot Knob mines at Ely are to be supplied with smelting facilities. In the Pilot Knob bodies of low-grade copper ores have been developed, says J. L. Gireaux, principal owner and manager.

**NEW MEXICO.**

**Colfax County.**

Two strikes are reported made at Elizabethtown. The first was in the Deep tunnel and the ore carries petzite (a silver-gold telluride). The Deep tunnel is in Baldy mountain 1400 feet and the vein struck, which is 6 feet in width, was cut at a depth of 900 feet from the surface. A considerable flow of water was opened up. The other strike was made on Goose creek, showing a body of sylvanite, and is 6 miles from Elizabethtown.

**Rio Arriba County.**

Machinery, consisting of boiler, hoist and drills, is being put in by the Dixie M. Co. at Hopewell.

**OREGON.**

**Baker County.**

The 10-stamp mill at the Emma mine, 6 miles east of Baker City, has been put in operation. The mill is at mouth of 1000-foot tunnel, which taps the pay shoot at depth of 500 feet. The mill is operated by electricity.—The big hoisting plant at the Virtue mine is in operation and work has been resumed on the triple-compartment shaft, which is down 300 feet. The hoisting plant is of capacity to sink 2000 feet. The number of men at the mine will be increased.

The Morning mine at Greenhorn, near Sumpter, has been taken over by the Morning G. M. Co., in which D. L. Killen, H. H. Ames et al. of Sumpter are interested. H. H. Nicholson is consulting engineer. A crosscut of 500 feet has been driven on the mill level and will open the Fairview and Parallel veins near their intersection. This work will be completed. The equipment of the Morning consists of a 5-foot Bryan mill, two concentrating tables, rock breaker of the Blake type, and 35 H. P. steam plant.

The Sumpter smelter at Sumpter, after several months' idleness undergoing alterations, has again been blown in.

Baker City reports say the Maxwell group, consisting of twenty-five claims, has been sold by the Pierce M. Co. to the Elkhorn Con. G. M. Co. The property is on Rock creek, 20 miles northwest of Baker City. Water rights, a 10-stamp quartz mill and a millsite are included in the property transferred for \$66,000.

Baker City reports say the reorganization of the Red Boy Con. M. Co. under the direction of A. Prussing of Chicago, Ill., who bought the property at sheriff's sale, has been completed, and \$100,000 will be available for development of the property. Operations will resume at the Red Boy. The development work will consist of 2000 feet of work. The new company will be the Red Boy Mines Co. The following are directors and officers: R. Nye, Fremont, Neb., president; J. G. English, R. P. Schneider, A. Prussing, J. O. Milligan, E. J. Godfrey and J. Thompson (the last named of Baker City).

H. Gerhardus, superintendent of the Monarch group in Cable Cove district, near Bourne, comprising eleven claims, owned by the Monarch G. M. & Dev. Co. of Portland, reports progress made this season in running on Crater ledge. The main ledge was crosscut for 30 feet. The ore extends across the Monarch, Debs and Hope ledges, all of which run into Crater ledge at one point. The dump contains 1000 tons of ore, which assays average of \$17, and a 5-stamp mill will be built. He has men on a new road that will cut off 5 miles of the distance from the camp to Bourne. F. Jennings is president of the Monarch company.

**Douglas County.**

The Continental G. M. Co., operating on South Myrtle creek, near Roseburg, will build a 40-ton milling plant, says Manager W. B. Stewart. Three tunnels are being driven on the main vein and all opening up ore.

Bohemia reports say the main working tunnel of Le Roy M. Co. is now in 600 feet on the ledge, which shows concentrating ore. The ledge has been exposed by six tunnels and a shaft for 1200 feet, showing average width of 15 feet. A reduction plant will be built. Short aerial tramways will be built from the lower tunnels on either side of the canyon to the mill-site on Champion creek, near Bohemia, where water and timber is at hand. The company has an air compressor plant and drills. A sawmill will be installed to turn out lumber and timbers for the plant and bunk and boarding houses.

Work on the Grizzly group, near Bohemia, will be resumed next week. The upper tunnel is in 500 feet, showing a shoot of ore 8 feet wide, with 180 feet of backs. About 200 feet lower down a crosscut tunnel is being run to cut the ledge. The property is on Grizzly mountain, and the ore is concentrating and smelting. The mine has millsite, water power and timber.

In Champion basin at Bohemia the Oregon Securities Co. is running an 8x9 tunnel through Grouse mountain to connect by electric railway the Musick mine on east slope of Bohemia mountain with the new mill in Champion basin. This tunnel will be 1600 feet in length, of which 800 feet is completed, and work is progressing at the rate of 5 feet daily. From mouth of tunnel down the mountain has been built a double-track endless wire tramway for 2600 feet to the mill, and enclosed with snowsheds. The 30-stamp mill is being finished. The company has an assay plant. The 500 H. P. electric plant of the company on Brass creek, 5 miles below, is in operation. The sawmill,

near the mill, is run with electricity. In the tunnel, at 400 feet, the Gray Eagle ledge has been cut, showing 6 feet of milling ore, and at 200 feet farther in, the Excelsior ledge has been cut, exposing 50 feet of milling ore. At 1000 feet the Champion ledge will be cut. All these ledges will have 1000 feet of backs from the tunnel level. One shift of two drills is driving, but a double shift will be put on next week.

F. J. Hard of the Vesuvius mine, near Bohemia, will add an electric lighting plant to his mill. The Vesuvius mill is about completed and will be ready to start work about Oct. 1st.

#### Grant County.

Near Alamo, Manager Witherop of the Oro Fino says the mine is being equipped for deep sinking. It includes a 40 H. P. boiler, hoisting and sinking plant of 600 feet capacity and pump. It is intended to sink between vein 1 and veins 2 and 3 and crosscut from the levels to the veins, which will be explored by drifts.

C. J. Allen, of Portland, principal owner of the Monumental mine, near Granite, has put men to work to reopen the mine. The machinery is being overhauled, which, with addition of improvements, will put the plant in condition to handle ore. There is a 6-drill compressor in the equipment. They will sink from the lower adit level at 1100 feet from portal of main crosscut. Alteration of the mill will be taken up next spring. The pan amalgamators will be taken out and amalgamating plates and concentrators put in. The ore will be roasted and wet-crushed. At present the Monumental mill is for dry crushing and the pan amalgamating process. By changing the mortars for new types the battery will be used as it is. Cyanide will be used after amalgamation and concentration, says Manager Allen.

#### Jackson County.

Opp, Reddy & Perry will put in machinery for a mill on Jackson creek below their present mill, near Jacksonville. Manager J. W. Opp says ore can be brought to the mill on cars by gravity from the mine. A building for a 20-stamp mill will be erected and ten stamps will be first put in. Power will be electricity from one of the Rogue river power stations.

Progress is reported in development at the Blue Lead copper mine of Upper Applegate, near Applegate, under management of the Bradshaw M. Co. of New York. Twenty-five men are employed. Superintendent G. W. Geddes states his company will put in a compressor and drive the tunnels with power drills.

#### Josephine County.

F. D. Million of Ashland and W. S. Love of Portland, with J. W. Thomasson, owners of the Blue Channel M. & D. Co., will put a hydraulic plant in on their claim in Robinson gulch, near Wolf creek. The property consists of three placer claims. Men are at work cleaning out ditches and sluice boxes, says Superintendent Thomasson.

Ore carrying free gold and sylvanite values is being taken out at the Lewis & Clark mine on Canyon creek, near Kerby. The mine is being opened up by the Lewis & Clark M. Co., of which M. Layman is manager, and headquarters are at Urbana, Ill. The formation is limestone and slate. The rich ores are from a depth of 100 feet in a tunnel on the vein. Development will proceed in this and also in five other tunnels. The company proposes to put in a milling plant soon. Electric drills are being used.

F. V. Metts, manager of the Silver creek basin placer mines near Grants Pass, says work is being carried on and 600 feet of tunnel is completed. The ditch is finished and the sawmill ready for operation. The tunnel will tap the basin at a depth of 210 feet from the surface, and 300 feet of tunnel remains to be run before the basin is tapped. After the tunnel is put through it will be enlarged and retimbered and double flumes put in.

C. Crane, superintendent of the Gold Lucky Queen mine on Jump-Off-Joe creek, near Grants Pass, says a 10-stamp mill will be put in this fall. The Granite Hill mine reports developing an ore shoot 500 feet long, the vein being 5 feet in width at the 200-foot level. The ore is milling rock. The company is steadily operating five stamps of the mill.

The Galice Con. M. Co. has opened a low bar on Rogue river, below Galice creek, near Grants Pass, taking advantage of the low water stage. A flume has been extended into the river. The gravel is said to be yielding 50 cents per yard.

At the Mountain Lion mine, in Missouri Flat district, 12 miles south of Grant's Pass, work is reported progressing under Crawford & Poindexter. Since June they have added 500 feet of tunnel, exposing two ore veins of an average width of 14 inches each. Two stopes have been

opened. The 5-stamp mill and concentrator have been overhauled and remodeled. Assay office and other buildings have been put up. The Mountain Lion is under bond to J. S. Crawford, M. B. Smith of Minneapolis, Minn., and C. H. Poindexter.

In Sucker Creek district, south of Holland, the Sucker Creek M. Co. has holdings of placer ground on California Bar. The company is working the ground and determining its value for more extensive operations by pumping and hoisting. While it is prospect work, and being done to ascertain the width and depth of the pay channel, the gravel is being hoisted and dumped into a sluiceway provided with riffles, where the gold is washed out, says Manager H. Warner. Two pumps supply water for the sluices and keep out the water from the drifts. A 7-mile ditch has been surveyed from the head of Sucker creek.

T. T. Burkhart of Portland, interested in the Gold Bug mine in Mount Reuben district, near Grants Pass, says development is progressing. The 5-stamp mill is not running at present, but will be opened again next month. The Benton, Gold Bug, Kramer and other mines in same district are being opened up.

#### Lane County.

A. O. Waller of the Great Northern Dev. Co., which operates near Blue River, says the Lucky Boy, which has been shut down while adding machinery, will resume operations this week. He also reports Woods & Diamond have started up their 2-stamp mill near the Lucky Boy.

### SOUTH DAKOTA.

#### Lawrence County.

The Copper, Gold & Silver M. Co. group at Galena has been bonded to J. S. Ford et al. of Chicago, Ill., who will build a mill and operate the mine. The price is \$25,000. There is low-grade ore in sight. The Gilt Edge Maid Co., 2 miles from Galena, has its 150-ton plant enclosed. The Cora M. Co. has been shut down temporarily. It is said there are 20,000 tons of ore on the dump, averaging \$5 per ton.

The Branch Mint M. Co., near Galena, is making improvements, including a 120-stamp mill and a branch railroad 3½ miles long.

It is reported the Homestake M. Co. at Lead will replace the horses hauling ore underground with compressed air engines. T. J. Grier is manager.

The Rossiter mill at Deadwood has resumed operations and will treat 60,000 tons of tailings on Deadwood creek, said to assay \$2.40. It is said a successful extraction can be made at cost of 43 cents per ton. Cost of conveying the ore from dump to tanks is given at 8 cents and the emptying at 2 cents per ton, or a total expense of 53 cents per ton for handling and treatment. The dump is 125 feet from the mill.

Sinking in the shaft of the Anaconda M. Co. near Lead will begin this week. The mine is on south extension of the Homestake ore belt and the shaft is following down a vein of free-milling ore. There is a steam hoisting plant on the ground.

The framework of the 100-ton cyanide plant of the Gilt Edge-Maid M. Co., east of Deadwood, is up and machinery being put in to run the plant. S. A. Duncan is manager. At the Dakota mine at Bald mountain the framework for the steam hoist is up. A shaft is being sunk to the quartzite level, already being 65 feet deep. A body of low-grade ore has been cut in the shaft and a mill will be built. The Dakota is shipping 130 tons of ore daily.

#### Pennington County.

The Holy Terror and Keystone mines at Keystone have been sold to C. J. Gunderson, A. E. Lee et al. of Vermillion. The mines have been idle for a year and the lower workings are under water. They will be opened and further developed. The ore carries arsenic and sulphides, and roasters will be put in to treat the mill tailings. The ore in the Keystone will be worked first and will be taken out through the Holy Terror shaft. Value is \$5 gold per ton.

### UTAH.

August, in the ore and bullion market, closed on settlements aggregating \$2,317,900, compared with a total of \$1,171,500 for August, 1903, says the Salt Lake Tribune, while to it may be added \$1,000,000 derived from sales of copper bullion containing gold and silver by owners of the copper smelters. There has been enforced curtailment of output at some of the producers. The American at Bingham blew in another furnace; the Bingham is installing a fifth and preparing with other equipment to make greater capacity. At the United States smelter, also at Bingham, work on the lead smelting plant is progressing, says G. K. Fisher,

superintendent of construction. Other plants are increasing capacities. The August output of pig-copper, in combination with gold and silver forwarded to the Eastern refineries during the month, was 3,744,986 pounds, compared with 2,573,580 pounds for August, 1903, divided as follows:

	Pounds.
Bingham Con.	1,030,400
Utah Con.	1,551,824
United States	1,152,762
Copper bullion contained in A. S. & R. Co. matte	900,000
Total pounds	4,644,986

The furnaces of the Utah Con. at Bingham are reducing metallic contents from 750 tons of ore daily, which will be increased to 800 tons.

#### Grand County.

Manager Wheat of the Grouse Mountain M. Co., operating at Miner's basin, near Basin, in La Sal district, says work will start next month, building a mill. L. V. Guthrie of Huntington, W. Va., is vice-president of the company.

#### Iron County.

Operations at the Johnny mines and mill at Stateline have been suspended indefinitely, as the water in the properties has become too heavy to handle with the equipment, says Superintendent Francis.

#### Juab County.

Work will be resumed in the Victoria mine at Tintic, either through the shaft put down by the company or the workings of the Grand Central mines, says Manager J. C. Sullivan.

Preparations are being made for the development of the ground owned by the McKinley M. Co. near Eureka. It is said a deal is under way to combine that ground with the property owned by the General Logan M. Co.

At Robinson, in the Mammoth mill, which has been closed for a year, dropping of the stamps has been resumed, and sixty men will be employed in the mill. At the Mammoth mine the main shaft, which is down 1990 feet, is going down at rate of 5 feet a day and will be sunk to the 2100-foot level. Shipments of first-class ore concentrates will be resumed.

The Latham M. & S. Co. will proceed with the equipment of its properties in Deep Creek section, near Fish Springs, for the concentration of its ores, says Manager Moats of Salt Lake City. The annual report of the management shows 32,900 tons of ore averaging 26% lead, ten ounces silver, 3% copper and fractional values in gold. The financial statement shows that during the year there has been expended on development of the properties \$41,775.71. G. L. Moats is treasurer and manager.

The Eagle Eye M. & M. Co. has been incorporated at Salt Lake City to develop properties in Tintic mining district. The officers are A. C. Lee, L. O. Ensign and B. A. Midgley.

#### Plute County.

The Annie Laurie M. Co. reports it will increase equipment in its mill at Kimberly, near Marysville, and will also put in electric haulage system in its lower tunnel.

#### Salt Lake County.

Excavations are being made for a concentrating mill for the Continental-Alta mines at Alta, says Manager Crowther. The first unit of the plant will have capacity of 100 tons daily.

A heavier hoisting plant will be put in at the Butler-Liberal mine in Bingham. The hoist will be placed over the shaft which is to connect with the main tunnel workings. Raising to the shaft is in progress, says Manager Jacobs.

August at the properties of the Boston Con. at Bingham, says Manager Johnson, gave net earnings of \$42,000, and yet the smelter required during last half of month to confine its daily output to 250 tons. There was forwarded to Bingham Con. smelter 7567 tons, showing 5% copper and \$6 gold and silver. A concentrator will be built.

The Valentine C. & G. M. Co. has been incorporated at Salt Lake City by J. W. Cairns, president; E. M. Cairns and D. M. Kennedy.

The Utah-Apex Co. at Bingham reports work will be started on a tunnel by which the expense of an angular haul will be reduced. It will be driven 3000 feet, the first vein to be tapped at 600 feet from the mouth. With this as an outlet a tramway over which to forward the output to market will be built. It is also said the company will provide a mill, and to that end has bought a site. Manager Orem of the Utah-Apex and New Red Wing is rebuilding the flume of the Live Oak mill, which was burned several years ago. P. M. McCrea is superintendent.

Material with which to build a tramway between the United States M. Co.'s Galena group and Jordan head-house, on the company's main line, is now on the ground, says Superintendent Mayberry at Bingham, and 1700 feet of aerial tramway

will be built. Lead, silver and gold-bearing ore have been opened up. Foreman Garland of the company's Telegraph group, says he is forwarding 350 tons of ore daily, and is prepared to increase the volume. In addition to the tonnage from the Telegraph, there is being sent out from the Old Jordan group 225 tons daily, or a total of 575 tons from the two, the contents consisting of copper, gold and silver in iron sulphides.—Bingham camp is supplying the mills and furnaces with 80,000 tons of ore per month.

#### Summit County.

Agreement has been signed by which the Daly West M. Co. acquires use of Ontario drain tunnel at Park City, and through which ore of former will ultimately pass. Work of extending the drain tunnel, now over 17,000 feet into the zone, will be started, the end-line of the Daly West to be reached in 1500 feet, the shaft to be connected with at a point 1500 feet in from the end line. With this the water problem at the Daly West will be settled, the horizon at which Daly West territory is penetrated being 1600 feet below that at which water has made its appearance in that mine. J. E. Bamberger, of Salt Lake City, is president of the Daly West Co.

At Park City, Manager C. L. Rood of the Daly M. Co. says operations have been discontinued at the Mazeppa shaft and that the Mazeppa country will be opened through the old Federal tunnel. Men are at work cleaning out the old tunnel workings. Crosscutting from the nearest point in the Federal tunnel level has begun in direction of the Mazeppa ledge. Power drills will be used. The ground has been explored to depth of 200 feet by the shaft and the tunnel will open the ground at 200 feet deeper and more than that on the dip of the vein. To get directly under the Mazeppa shaft, it is said 600 feet of work will have to be done.

Operations have been resumed at the Comstock mill at Park City.

#### Tooele County.

It is reported T. C. Wiswall et al., owning the Geyser-Marion group at Mercur, will also take over the properties of the Gold Dust M. Co. and the Silver Cloud mine. The Gold Dust has gold-bearing ores, as also the Silver Cloud. A cyanide plant will be built to handle the tailings dumps of the Geyser-Marion group. Some of the sands are said to show \$3 per ton gold, and the average is \$1. The ores from the Gold Dust and Silver Cloud will be mixed with the auriferous tailings in the dumps for treatment.

E. J. Raddatz, superintendent of the Honerine properties at Stockton, says good headway is being made in driving the tunnel to connect with the main Honerine shaft notwithstanding that water is issuing from mouth of the tunnel at the rate of 7000 gallons per minute, and that it makes a stream 2½ feet deep. The adit is completed for 6350 feet, and will be driven 650 feet more to make connection with the Honerine shaft. The mill is running and is reducing to concentrates 300 tons of ore per day.

For 1000 pounds of slag from its refinery at the mill at Mercur the management of the Con. Mercur reports last week receiving \$4221.28.

### WASHINGTON.

#### Stevens County.

A. L. Hughes, manager of the Knob Hill and American Flag Con., near Rock Cut, Lake Perie district, reports cross-cutting a 75-foot ledge assaying \$10 per ton. The company has cut the First Thought ledge on the American Flag Con., and development work will be increased. The American Flag Con. is ¼ of a mile from the First Thought. Hughes states the Giant company will put in an air compressor on its mine near the American Flag Con. The Abe Lincoln property will start next week after an idleness of several months.

#### Whatcom County.

The mine owners of Slate Creek mining district are considering building a smelter for that region, says O. B. Brown of Chicago, Ill., secretary and treasurer of the Chancellor G. M. Co., operating in that district. The chief problems are transportation and fluxing ores. A suitable site to build the plant, says Brown, is below the Chancellor mine. Pending decision regarding the smelter the Chancellor company is withholding the installation of a 10-stamp mill. Brown says it may be necessary to have a concentrating plant even though a smelter is built.

### WYOMING.

#### Carbon County.

Another strike is reported made in the Doane Rambler copper mine at Rambler. In running a crosscut from a tunnel 125 feet from the old shaft, a breast of copper ore 4 feet wide was cut. It is estimated the ore runs 15% copper.

FOREIGN.

BRITISH COLUMBIA.

Boundary District.

A compressor plant will be put in at the Betts & Hesperus mine of the Hesperus G. & C. M. Co. of Marquette, Mich. The mine is 3 miles from Grand Forks.

Greenwood reports say the E. P. U. mine has been bought by W. F. Honey et al. of Park River, N. Dak. D. McIntosh, manager of the Providence M. Co., will have charge. Men will be set to work this week. — The Combination, north of Greenwood, adjacent to the Elkhorn, has been bonded to Gaunce & Wickwire. The property will be incorporated. — A deal is reported pending for the Canadian mine, owned by J. Sutherland.

The Montreal & Boston C. Co. has put men to work on the Rawhide, adjoining the Snowshoe mine, near Phoenix, to get ready for making shipments of ore. A tunnel is into the hill and connected with the shaft, showing up bodies of ore. It is intended to build ore bunkers at the Rawhide capable of holding twenty railroad cars of ore, and to ship the same to the company's Boundary Falls smelter. At the Brooklyn enlarging and retimbering the incline shaft is progressing. It is intended to blow the smelter in about October 1st, when the properties will be in position to maintain regular shipments of ore.

At the Mother Lode mine at Greenwood 130 men are at work. — On the last monthly payday at the Granby and Brooklyn mines at Phoenix \$40,000 was disbursed in wages. During August the Granby mines shipped 42,030 tons of ore, being 8000 tons more than in July. In August 400 feet of development were done.

**Cariboo District.**

Hydraulic mining in the Cariboo has ceased for the season and all the gold has been cleaned up from the sluices. Despite the dry season the clean-up has been satisfactory, the Con. Cariboo, Ltd., alone reporting \$130,000.

**East Kootenay District.**

During the month of August 1800 tons of concentrates were shipped from the Eugene mine at Moyie.

The Kootenay Coal Co. of Victoria, L. H. Prather of Spokane, Wash., president, will increase development of its coal holdings and will build coke ovens and railroad. The company has title to 105 claims, while title to four others are in dispute at present. The railroad, in which W. F. Teetzel of Nelson is interested, will be 25 miles long and connect with the Great Northern at Elko. The Kootenay Co.'s land is 15 miles long by 10 miles wide and is 12 miles southeast of Morrissey.

F. Hogan of Spokane, Wash., of the Sullivan mine's smelter at Marysville, says it is intended to put in a lead corroding plant for manufacture of white lead and also lead pipe. In the remodeling of the smelter little of the old plant is being used. An entirely new building was built, and nearly all of the furnaces reconstructed. Two stacks will be built.

**Lillooet District.**

The mines of the Anderson Lake M. & M. Co. have been sold to J. B. Smith of Montreal for \$45,000. The mines are at Anderson lake, near Lillooet, and development will be resumed next week. Several claims adjoining the Anderson Lake mines have also been bought by Smith, and it is intended to move the mill from its present site, and ultimately to operate sixty stamps.

**Rossland District.**

P. S. Cauldrey, manager of Le Roi No. 2 Co.'s mines at Rossland, says he will increase development in the company's Josie mine. It is not intended to reopen the No. 1 mine at this time. The concentrator will be kept running on water concentration. The oil concentrator is not in operation. Forty-five tons of second-class ore are being milled daily.

**Slocan District.**

For 1903, the ore shipments from mines at Slocan City amounted to 1339 tons, made up from seventeen properties. Shipments this year to Sept. 15th have been:

Mine.	Total.
Enterprise.....	580
Ottawa.....	72
Neepawa.....	72
Port Hope.....	17
Republic.....	32
Black Prince.....	57
Alberta.....	15
Six others, a total of.....	20
Total.....	1,555

The Wakefield mine at Silverton is closed down temporarily. — There are 600 men working in the mines around Sandoz. — The Payne mine continues to ship iron ore to Trail. — The Wey-

mouth, on Ten Mile, has been crown granted.

The Reco mine, near Sandoz, has twenty men at work, and this will be increased to fifty. S. E. Davis is in charge. New ore sheds and other buildings will be put up.

**Vancouver Island.**

A group of zinc properties on Quatsino sound, near Quatsino, will be developed and the product shipped to Iola, Kansas. T. Jones of the Lanyon Zinc Co. of Iola, Kan., has at the Minerva and Peerless claims on southeast arm of Quatsino sound, arranged for development work and shipment of the zinc ores. The vessel will land it at the mouth of the Mississippi river for \$4 per ton, and it will be sent up the river on barges to the smelter.

T. R. Stockett, manager of the Nanaimo coal mines at Nanaimo, says the pit head erected in place of the one destroyed by fire has begun hoisting coal. At the Northfield mines it will be possible to load coal direct from the mine to the ships.

**West Kootenay District.**

E. M. Morgan and P. H. O'Connor at Poplar will build a stamp mill to treat the ores of the Lucky Jack and Swede groups. — D. McRae and C. Diamond are working the Alhambra group at head of Rapid creek. A 30-foot tunnel has been run and a 16-foot shaft sunk. There are two ledges on the group. One carries galena 3 feet wide at bottom of shaft, showing ruby silver.

**CANADA.**

**Alberta.**

H. N. Galer, manager of the International Coal & Coke Co. of Coleman, reports the first battery of coke ovens completed. Progress with installation of the plant is being made. The coal tippie is completed. It has capacity of 2000 tons per day. Next week the fan will be in operation, enabling the colliery to maintain an output of 500 tons of coal daily.

**Manitoba.**

D. H. Urquhart and A. McCall of Rat Portage report discovery of a deposit of tin-bearing ore in eastern Manitoba, about 3 miles from the Ontario boundary line and south of Cross lake. It is claimed the deposit is in granite and slate. They will develop it.

**Yukon Territory.**

The gold output of the Klondike for the season of 1904 is estimated at \$10,000,000, says the Dawson World. The Government valuation used as a basis on which to compute the export tax is \$15 per ounce. The general average is said, however, to be \$16 per ounce. The Dawson office of the comptroller reports for July \$1,300,250 received, and for August \$1,539,518 — exclusive of Forty Mile and Whitehorse. There was abundance of rainfall for the season.

**MEXICO.**

**Mexico.**

B. F. Graham of Bisbee, Ariz., president of El Tigre mine, below Douglas, says a cyanide plant will be built; and a reverberatory furnace will be built for smelting, as copper and iron ores are obtainable near the company's gold mine.

**Nuevo Leon.**

The Harrison smelter at Cerralvo, 90 miles northwest of Monterey, is working 120 men. The plant consists of three lead furnaces and a silver and lead refinery. The output of bullion is 4000 to 5000 bars of 105 pounds each, says H. C. Harrison, owner. The ore is brought from the mines in ox carts.

**Queretaro.**

O. & T. Braniff of Mexico City have entered into an agreement with the United M. & D. Co. of New York for development and operation of silver, lead and copper mines in Queretaro. J. Thompson and E. G. Spilsbury are respectively president and chief engineer of the New York company. It is proposed to spend \$500,000 in gold in development work and purchase of American machinery.

**San Luis Potosi.**

The National Metallurgical Co. will build a smelter at junction of the National and Matehuala railroads at Matehuala. Two furnaces are to be put in—a lead furnace of 150 tons capacity and another of 300 tons. The company has been delayed owing to difficulty in procuring sufficient water. Water for power will be taken from the Jordan river; but, to guard against failure of water supply, a 500 H. P. gas plant will be put in at Matehuala. The company has mines in Matehuala, Charcas, Salado and other districts.

**Sonora.**

P. E. Murray of Nogales, Ariz., says he will put in an oil rig to drill 2000 feet on the property of the Sonoita Oil Co. The 30-stamp mill of the Hays Con. M., M. &

L. Co., in the Pineta mountains east from Quijano, is in operation. The company has developed by a tunnel a 12-foot body of free-milling gold ore.

J. A. Singley, operating mines near Caborca, in Altar district, says he is putting in machinery.

H. C. Gerber, general manager for the Yaqui River S. & R. Co., at Toledo, on the Yaqui river, says the smelter has been blown in.

The 20-stamp mill of the Nogales C. Co. at Cerro Prieto, east of Magdalena, is closed down, pending enlargement to sixty stamps. F. Cox is superintendent.

It is reported the Yaqui C. Co. will put in at the Yaqui river, near its mines at Campo Santo Nino, a hydro-electric power plant of 1000 H. P. to operate its 2000-ton smelter, drills, etc. W. E. Pomerooy is superintendent, with mine office at Suquia de Batuc.

La Compania Minera de Sonora Reina de Cobre, S. A., has been organized in Nogales, Ariz., to develop copper properties near Caborca, Altar district, by J. Henderson, J. H. Elliott, P. & A. Sandoval and J. H. McKibben.

In the Vallecitos mine of the Sierra Azul M. Co., east of Imuris, a body of wolframite is reported opened, assaying \$20 in gold. The rock concentrates five tons into one. — H. C. Rolfe, superintendent of the Calumet & Yaqui River C. Co., reports that a ledge 10 feet wide, carrying copper, gold and silver, has been cut in the 150-foot level.

\*\*\*\*\*

**Personal.**

\*\*\*\*\*

G. SPERLING is city engineer of Boise, Idaho, vice C. H. Irwin.

E. R. WOAKES has returned to Linares, Spain, from London, England.

J. H. TREVORRAN is mine superintendent for Le Roi C. Co. at Rossland, B. C.

H. WITTEBERG is assayer and chemist at the Liberty Bell mill, Telluride, Colo.

C. S. VERRIL has accepted a position with the Curlew M. Co. at Republic, Wash.

C. HAWKINS is manager of the Ivanhoe Junction mine at Kalgoorlie, Western Australia.

T. CORNISH is manager of the Nevada Con. G. M. & M. Co. mines near Central City, Colo.

W. L. COBB has returned to San Francisco, Cal., from mine examination in Kern county, Cal.

Z. HOUSER has resigned as superintendent of the Standard mines, near Sumpter, Or.

J. MOYNAHAN is manager of the Pyrenees & Nimrod group of mines, near Central City, Colo.

F. ROOD is superintendent of the Big Bar M. Co., operating near Orleans, Humboldt county, Cal.

A. H. ELFTMAN of Minneapolis, Minn., has gone to British Columbia to make mine examinations.

G. W. MCCLANAHAN of Booneville, Mo., is manager of the Bertha M. Co., at Idaho Springs, Colo.

H. J. MEISEL, assayer and chemist, Rawhide M. Co., of Jamestown, Cal., is in San Francisco, Cal.

C. C. MAJOR is professor of mechanical engineering at the University of Oklahoma, Stillwater, O. T.

E. H. PLATT of Denver, Colo., has gone to Jimuleo, Coahuila, Mex., as manager of the Jimuleo M. Co.

P. E. LAWRENCE returned last week to Los Angeles, Cal., from an extended Eastern trip on mining business.

P. S. CAULDREY, formerly manager of Le Roi No. 2 mines at Rossland, B. C., has reassumed that position.

G. F. BADGETT has resigned as superintendent of the Montana-Tonopah M. Co.'s mines at Tonopah, Nev.

J. JACOBS is superintendent of the North Star group of mines, adjoining the Gold Cliff mine, at Angels, Cal.

R. W. JOHNSON of Mojave, Cal., has accepted a position at the Stonewall mine, Cuyamaca, San Diego county, Cal.

W. J. LEIGH-HUNT is superintendent of reduction works for an English company at Pachuca, Hidalgo, Mexico.

F. CRABTREE has been appointed professor of mining and metallurgy at the Colorado School of Mines, Golden, Colo.

E. H. LIVERING is consulting engineer for the Associated Mines, Ltd., with offices at Kalgoorlie, Western Australia.

JOHN FILIUS of Redding, Cal., and Denver, Colo., last week made examination of the Dewey mine, Siskiyou county, Cal.

D. B. GILLIES of Butte, Mont., is manager and superintendent of the Montana-Tonopah M. Co., operating at Tonopah, Nev.

S. S. RAYMOND is general superintendent of the North American C. Co. and its allied properties at Grand Encampment, Wyo.

E. A. H. TAYS is resident engineer at the mines of the Braniff M. & S. Co., operating near Cadereytas, Queretaro, Mexico.

E. A. NORTON is president and manager of the Cripple Creek Enterprise M. Co. of Cripple Creek, Colo., vice D. Hanley.

D. MCINTOSH, manager of the Providence M. Co. at Greenwood, B. C., will also have charge of the E. P. V. mine, in the same section.

N. F. HEATH, recently of Colorado, has been appointed superintendent of the Standard mines, near Sumpter, Or., vice Z. Houser, resigned.

N. G. THOMPSON is manager of the mines of the Candelaria M. Co. at San Pedro, on the Sierra Madre Railroad, Chihuahua, Mexico.

T. P. RIGNEY has resigned from the Summit Placer Co. and will reopen his office as consulting mining engineer at Salt Lake City, Utah.

F. E. YOUNG, E. M., Boston, Mass., is in Siskiyou county, Cal., investigating the merits of mining properties for New York and Boston investors.

REEVES DAVIS of San Francisco, Cal., has returned there from examination of several mining properties on the lower Klamath, Siskiyou county, Cal.

G. W. MABEE of Central City, Colo., has gone to Gracias a Dios, Nicaragua, to take the management of the mines and mill of the Nicaragua G. M. & M. Co.

D. HANLEY has retired as president and manager of the Cripple Creek Enterprise M. Co. of Cripple Creek, Colo., but remains as a director in the company.

W. GARRISON of Cananea, Sonora, Mexico, has gone to Puebla as general foreman of the Tezuitlan M. & S. Co. at La Aurora via Tezuitlan, Puebla, Mexico.

G. A. LAIRD, recently manager of the La Victoria y Anexas mines, in San Luis Potosi, Mexico, is manager of the Calderona group, near Ojo Caliente, Zacatecas, Mexico.

M. M. DODGE at Mexico City, Mex., has resigned from his connection with the Phelps-Dodge Co. to manage his personal mining interests in Mexico, Arizona and California.

P. GASTON of Young & Gaston, San Francisco, Cal., has returned from Philadelphia, Pa., where he went on matters pertaining to the firm's mining interests at Tonopah, Nev.

\*\*\*\*\*

**Obituary.**

\*\*\*\*\*

E. BLAKE, a pioneer miner of Park City, Utah, died in Salt Lake City, Utah, on the 11th inst.

C. L. HERRICK, a geologist and former president of the University of New Mexico, died on the 15th inst. at Socorro, N. M.

S. RAUHEIM, a mining engineer, died at New York City on the 14th inst. Deceased was identified with the opening and development of copper properties in Montana.

WESLEY HUNTER, a pioneer mining man of Colorado, died at Idaho Springs, Colo., on the 6th inst. Deceased was born in Ohio in 1836, and went to Central City, Colo., in 1860. He was interested in mining property at Idaho Springs.

C. H. COOK, a Utah mining man, died at Salt Lake City, Utah, on the 10th inst., at the age of 67. Deceased was born in Pennsylvania, but went west during the mining excitement at Leadville, Colo., in the spring of 1879. Seven years ago he moved to Salt Lake City, Utah.

THOMAS WILLIAMS, a California mining man, died at San Jose, Cal., on the 16th inst. Deceased was at one time superintendent of the Mountaineer mine at Nevada City, Cal. He was connected with quicksilver mines of San Benito county. He was a native of Cornwall, England, 64 years of age, and went to California in 1856.

## Commercial Paragraphs.

THE Stillwell-Bierce & Smith-Vaile Co. of Dayton, Ohio, will be reorganized under the new management, and in future will be known as the Platt Iron Works.

THE Brown-Corliss Engine Co., Corliss, Wis., have an order for one 24x44x48 inch tandem compound rolling mill engine for the United States Steel Corporation, to be installed at their McKeesport plant, Pittsburgh.

J. P. STERLING of 3923 Balt. Ave., Kansas City, Mo., representing the Prinz & Rau Mfg. Co. of Milwaukee, Wis., has several orders for their perfection dust collector from the General Metals Co., Colorado Springs, Colo., who are putting in a new mill and who find these dust collectors to be of material value.

THE C. O. Bartlett & Snow Co., Cleveland, Ohio, are in receipt of the following orders: Levi Cohn Bros., Lancaster, Pa., one 72-inch Triumph steam dryer; Ohio Retarder Co., Port Clinton, Ohio, one 72-inch Triumph steam dryer; Sheets Bros. Elevator Co., Cleveland, Ohio, complete elevator machinery output for their plant recently destroyed by fire; Good Roads Machinery Co., Uniontown, Pa., one elevating outfit.

W. E. HAMPTON, president National Wood Pipe Co., Los Angeles and San Francisco, Cal., while recently in the Northwest, inspected the 48-inch pipe line which his company is building for the Washington & Oregon Power Co. of Walla Walla, Wash. This pipe line is built on a bench along the south wall of the Walla Walla river. In places this is a sheer wall of solid rock, the pipe line being built several hundred feet above the river, the cliffs rising hundreds of feet above the pipe line. At several points, also, the pipe line is built on high trestle work. Building the line is in charge of J. L. Stannard.

COLORADO IRON WORKS of Denver, Colo., are filling the following orders: A 30-stamp amalgamating and concentrating mill for the Werderhoff M. & M. Co. in Idaho; a 100-ton concentration plant for the Granadina mine in Mexico; six sets C. I. W. 40x16-inch improved standard wide-faced crushing rolls for the Detroit Copper Co. in Arizona; a Bretherton hot blast box, iron work for one 42x150-inch copper matting furnace, two 31½ cubic feet elliptical slag trucks for the Bradshaw Mountain C. M. & S. Co. of Arizona, and a set of 12x12-inch sampling rolls, an elevator, a Dodge crusher and sample grinder for the Luna Lead Co. in New Mexico. The last carload of machinery for the Ruby Basin M. & T. Co.'s concentrating plant will leave this week.

## Books Received.

"The Architects' and Builders' Pocket-Book," by Frank E. Kidder, C. E. Phd., has been issued in the fourteenth edition. It has been rewritten and rearranged and brought up to date. This valuable and carefully prepared volume contains over 1000 drawings, and 1632 pages of text, besides an exhaustive index which enables the reader to readily turn to the page devoted to any subject. The fact that any technical book can endure through thirteen editions, with a large demand for the fourteenth, is as good a testimonial as any standard work should require. As a reference book it is of great value to the architect and structural engineer, draughtsman and master builder. The information contained is presented in a simple and convenient form. It contains a great many new tables, and is in many ways designed to be an authority on the subjects of which it treats. Flexible morocco cover, price \$5. John Wiley & Sons, New York; Chapman & Hall, London.

## Trade Treatises.

THE merits of the Akron Chilian mill are lucidly set forth in a pamphlet from the Wellman-Seaver-Morgan Co. of Cleveland, Ohio, portraying its operation in the wet grinding of metalliferous rock.

CATALOGUE E of the Ruggles-Coles Engineering Co., 39-41 Cortlandt street, New York, and Old Colony Building, Chicago, is devoted to the Ruggles-Coles dryers, with test results, testimonials and list of users and in what capacity the dryer is so used.

## Latest Market Reports.

SAN FRANCISCO, September 23, 1904.

### METALS.

SILVER.—Per oz., Troy: London, 26½d (standard ounce, 925 fine); New York, bar silver, 57½c, refined (1000 fine); San Francisco, 57½c; Mexican dollars, 47c; San Francisco, 45½c New York.

COPPER.—New York: Standard, \$12.75; Lake, 1 to 3 casks, \$13.00; Electrolytic, 1 to 3 casks, \$12.75; Casting, 1 to 3 casks, \$12.50; San Francisco: \$15.00. Mill copper plates, \$17.00; bars, 18@24c. London: £58 2s 6d spot per ton.

The total visible copper supply reported by James Lewis & Sons of Liverpool, England, Sept. 1, 1904, was 13,420 tons, a gain of 558 tons over the total supply of Aug. 1.

LEAD.—New York, \$4.30; Salt Lake City, \$3.50; St. Louis, \$4.12½; San Francisco, \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½c; pig, \$4.85. London: £11 17s 6d long ton.

SPELTER.—New York, \$5.20; St. Louis, \$5.00; London, £22 10s 3d; San Francisco, ton lots, 6½c; 100-lb. lots, 7c.

TIN.—New York, pig, \$27.62½@27.85; San Francisco, ton lots, 29c; 500 lbs., 29½c; 200 lbs., 30c; less, 31c; bar tin, 32½@35c. London, £126 15s spot.

PLATINUM.—San Francisco, crude, \$18.50 per oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75 @ 82c per gram.

QUICKSILVER.—New York, \$42.00@44.00, large lots; London, £7 15s San Francisco, local, \$41.50@42.50 per flask of 75 lbs.; Denver, \$45.00. Export, \$41.50@42.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 31½c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 18½c; San Francisco, Plumbers', 100-lb. lots, 16c.

ZINC.—Metallic, chemically pure, 3½d., 50c; dust, 3½d., 10c; sulphate, 3½d., .04c.

NICKEL.—New York, 40@47c per lb.; ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 31@34c.

### STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$12.85 @13.20; gray forge, \$12.00; San Francisco, bar, 3c per lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$23.00@23.00; open hearth billets, \$23.00 @23.00; San Francisco, bar, 7c to 12c per lb.

No. 1 cast, net ton .....	10 00@10 50
Iron rails .....	16 00@16 50
Car wheels .....	11 00@11 50
Cast borings .....	4 00@4 50
Turnings .....	7 00@7 50

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6½c; less than 500 lbs., per lb., 7c; in 25-lb. tin pails, ¾c per lb. above keg price; in 1 and 5-lb. tin cans, 100 lbs. per case, ¾c. per lb. above keg price. Dry Lead.—In bbls., 1 ton and over, 6½c; do. in kegs, 7c.

LUMBER.—(Retail): Pine, ordinary sizes, \$24.00@25.00; extra sizes higher; redwood, \$28.00@30.00; lath, 4 feet, \$4.50 @5.00; pickets, \$21.00; shingles, \$2.50 for No. 1 and \$2.25 for No. 2; shakes, \$13.50 for split and \$15.00 for sawed; rustic, \$28.00 @35.00.

NAILS.—This week the basic prices are: Wire, \$2.77; Cut, \$3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, \$3.35; Cut, \$3.55; 10d to 16d, Wire, \$3.45; Cut, \$3.35; 8d Wire, \$3.50; Cut, \$3.50; 6d and 7d, Wire, \$3.60; Cut, \$3.60; 4 and 5d, Wire, \$3.70; Cut, \$3.70; 3d, Wire, \$3.85; Cut, \$3.85; 2d, Wire, \$4.10; Cut, \$4.10. Special rates for carload lots.

LIME.—Santa Cruz, \$1.25 country, \$1.25 city per bbl.

CEMENT.—Imported, \$2.15@2.65 per bbl.; California carload lots, \$2.10 f. o. b. at works; small lots, \$2.40 per bbl. in sacks, 4 sacks to bbl., 10c for each sack returned.

### GENERAL SUPPLIES.

ANTIMONY.—New York, Cookson's, 7½c; Hallett's, 6½c; San Francisco, 1000-lb. lots, 8c; 300@500-lb., 8½c; 100-lb. lots, 10½c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1\*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1\*\* 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2\*\* 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2.00 per keg.

CAPS.—3x, \$5.50@6 per 1000; 4x, \$6.50 @7; 5x, \$8@8.50; Lion, \$9@9.50, in lots not less than 1000.

FUSE.—Triple tape, \$4.00 per 1000 feet; double tape, \$3.50; single tape, \$3.10; Hemp, \$2.75; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11½c per set; 14 oz., 40s., 10c.

COAL.—San Francisco, coast, yard prices: Wellington, \$8.00; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallsend, \$7.50; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8.00; Cumberland, \$13.00; Cannel, \$8.50; Welsh Anthracite, \$13.00; Rock Springs, \$8.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13.00 in sacks; Sunnyside, \$8.50, long ton.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 23@24c per lb.; carloads, 23@23½c; in tins, 30c; soda ash, \$2.00 per 100 lbs.; hyposulphite of soda, 3@3½c per lb.; caustic soda, in drums, 3@3½c per lb.; Cal. s. soda, bbls., \$1.20@1.40 per 100 lbs.; sks., \$1.05; chloride of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2½c; powdered sulphur, 2@3c; flour sulphur, French, 3½@3½c; alum, \$2.00@2.25; California refined, 1½@2c; sulphide of iron, 8c per lb.; copper sulphate, 5½@5½c; chloride of lime, spot, \$2.50@2.75; sulphuric acid, in carboys, 66% B, 1½@2c per lb.; nitric acid, carboys, 8c per lb.

OILS.—Linseed, boiled, bbl., 57c; cs., 62c; raw, bbl., 55c; cs., 60c; Lucol oil, boiled, bbl., 50c; cs., 55c; raw, bbl., 48c; cs., 53c. Kerosene—Pearl, per gal., 19½c; Astral, 19½c; Star, 19½c; Extra Star, 24c; Eocene, 23c; Elaine, 26c; Water White, in bulk, 13c; Mineral Seal, iron bbls., 18c; wooden bbls., 20½c; cs., 24c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22½c; 88° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 13c; do., in cs., 19½c; Lard Oil, E. W. S., bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Sperm, crude, 63@68c; Natural White, 63c; Bleached, do., 57c; Whale Oil, cs., 52@57c.

ALUMINUM.—No. 1, 99%, small lots, 37c per lb.; 100 lbs., 35c; 1000 lbs, 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

BORAX.—Concentrated, 6@7c per lb.; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

BONE ASH.—Extra No. 1, 5@6c per lb., No. 1, 4@5c.

RED LEAD.—500 lbs. and over at one purchase, 7½c per lb.; less than 500 lbs., 7½c.

LITHARGE.—Pure, in 25-lb. bags, 8@9c per lb.

MOLYBDENUM.—Best, \$2.00 per lb.

CHROMIUM.—90% and over, 3½c, 80c.

PHOSPHORUS.—American, 3½c, 70c.

SILVER.—Chloride, 3½ oz., 90c@1.00; nitrate, 55c.

MERCURY.—Bichloride, 3½ lb., 77c.

MAGNESIUM.—Pure, N. Y., 60c.

MANGANESE.—3½ lb., \$2.75.

SODIUM.—Metal, 3½ lb., 50c.

BISMUTH.—Subnitrate, 3½ lb., \$2.10.

URANIUM.—Oxide, 3½ lb., \$3.50.

FIRE BRICK.—Domestic, carloads per 1000, f. o. b., factory square, \$25.00; soap and split, \$22.50; arch and wedge, \$27.50; skewback, \$30.00; circle, \$32.00.

FIRE CLAY.—Domestic, per ton 2000 lbs. in 125-lb. bags, double, and dry ground, f. o. b., factory, \$8.50.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

## Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

HYDROCARBON STEAM GENERATOR.—No. 769,901. Sept. 13, 1904. Benj. Hall, Nevada City, Cal. This invention relates to an improved hydrocarbon burner and self-contained steam generator attachment. Its object is to provide a simple apparatus which shall combine a burner and generator

wherein the steam will be formed gradually, the pressure equalized, and the product supplied to the burner without the puffing, spluttering, and noise usually incident to apparatus of this type.

AUTOMATIC WEIGHING MACHINE.—No. 769,909. Sept. 13, 1904. A. W. Livingston, Alameda, Cal. This invention relates to an improved apparatus for automatically segregating, weighing and delivering dried fruits or other material in any predetermined quantity to be put up subsequently in packages of uniform size and weight. Its object is to provide a continuous movement machine which shall be automatic, accurate, and of large capacity.

WATER PURIFYING TANK ATTACHMENT.—No. 769,956. Sept. 13, 1904. Winfield Curtis, Sacramento, Cal. One-half assigned to E. F. May of San Francisco, Cal. This invention relates to improvements in water tanks; and it consists of a preliminary receiver and aerator, preferably located within the tank, firmly secured to the bottom and sufficiently higher so that the water which is first delivered into this small receiver overflows from top when it is full into the larger outer tank. In operation, with the receiver and tank, are separated draw-off pipes with control valves, so that the water may be drawn from either one independent of the other or may be drawn from either or both the tanks to different points of delivery.

GOLD SAVING APPARATUS.—No. 769,886. Sept. 13, 1904. J. S. Bollinger, Cherokee, Cal. One-half assigned to J. R. Clark, of Yankee Hill, Cal. This invention relates to improvements in gold saving apparatus, and particularly in means for use in conjunction with riffled or like surfaces for retarding the velocity of the under-current to allow concentration of the values.

WASHING MACHINE.—No. 769,890. Sept. 13, 1904. E. L. Davis, Santa Rosa, Cal. This invention relates to improvements in clothes-washing machines. Its object is to provide a practical, simple, durable, and efficient mechanical washer which will automatically adjust itself to any quantity of clothes in the tub, which will not interfere with the wringer, which may be quickly folded back out of the way to save space to the contents of the tub, which will not become loose-jointed, which will confine the steam, and which may be operated with a minimum amount of exertion on the part of the housewife.

TRAVELING HARVESTER.—No. 769,965. Sept. 13, 1904. James Tretthewey, Stockton, Cal. Assigned to the Harris Mfg. Co., of Stockton, Cal., a corporation. This invention consists in the combination of parts including a gasoline engine by which the cutting, threshing and cleaning mechanism are driven while the machine is hauled over the ground by separate and independent power. The object of said invention is to combine the power of a plurality of internal combustion engines which are centrally located and with such relation to the main bearing wheels as to assist in counterbalancing the weight of the machine, and by means of supporting girders extending across the machine the engine is centrally located approximately above the threshing cylinder and in position to transmit its power to the shafts to all parts which are to be driven by the engine.

REVERSIBLE WAGON SEAT.—No. 769,876. Sept. 13, 1904. M. A. Schuster, Newman, Cal. This invention consists in a combination of parts whereby the seat of a wagon may be reversed to present either side upward.

HEAD-GATE FOR IRRIGATING DITCH.—No. 769,968. Sept. 13, 1904. Wm. J. Warren, Modesto, Cal. This invention relates to a head-gate and connections therefor especially adapted for use in conjunction with irrigating and like ditches which are laid in the soil. It consists of a concrete base with means for preventing the seepage of water and a gate with means for moving it in grooves or channels formed in the base, said gate having elastic flexible peripheral edges adapted to make a tight joint.

GRAVITY TRAMWAY BLOCKS.—No. 769,998. Sept. 13, 1904. A. D. Foote, Grass Valley, Cal. This invention relates to a pulley-block and brake attachment adapted for use upon gravity and like tramways. The object of the invention is to provide a means for regulating the speed upon inclined tramways where a loaded car connecting with one end of a rope pulls an empty car up while itself is going down.

## New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR THE WEEK ENDING SEPTEMBER 13, 1904.

769,978.—GRAINING MACHINE—B. A. Augustine, Alameda, Cal.  
770,215.—CONTAINING VESSEL—Blatz & Fales, Los Angeles, Cal.  
769,886.—GOLD SAVING APPARATUS—J. S. Bollinger, Cherokee, Cal.  
769,981.—OIL BURNER—H. B. Cary, Los Angeles, Cal.  
769,856.—WATER TANK—W. Curtis, Sacramento, Cal.  
769,998.—WASHING MACHINE—E. L. Davis, Santa Rosa, Cal.  
769,998.—GRAVITY TRAMWAY BLOCK—A. D. Foote, Grass Valley, Cal.  
770,058.—WRENCH—W. P. Foster, Jacumba Springs, Cal.  
770,060.—JAR CLOSURE—C. Fricke, S. F.  
770,093.—BEDCLOTHES CLAMP—A. Grandjean, National City, Cal.  
769,901.—STEAM GENERATOR—B. Hall, Nevada City, Cal.  
769,747.—PAPER FEEDER—J. W. Hoag, S. F.  
769,909.—WEIGHING MACHINE—A. W. Livingston, Alameda, Cal.  
769,940.—FISH TRAP—O. Melbye, Cypress Island, Wash.  
769,953.—WATER HEATER—G. H. Miner, Pasadena, Cal.  
769,880.—SHUT OFF—J. G. Nehrhas, Seattle, Wash.  
769,768.—LOCK—B. Phelps, Seattle, Wash.  
769,769.—LOCK—B. Phelps, Seattle, Wash.  
769,770.—LOCK—B. Phelps, Seattle, Wash.  
770,105.—BAND SAW GUIDE—A. Prana, Everett, Wash.  
769,832.—WEED CUTTER—L. C. Preston, Weston, Or.  
770,115.—DENTAL APPLIANCE—F. C. Rood, Walla Walla, Wash.  
769,876.—REVERSIBLE WAGON SEAT—M. A. Schuster, Newman, Cal.  
769,877.—UMBRELLA FRAME—P. Serge-Kisslow, Portland, Or.  
769,963.—TOILET PAPER HOLDER—A. E. Sexton, Los Angeles, Cal.  
770,127.—CONDENSER—O. S. Still, Annette, Cal.  
769,965.—HARVESTER—J. Tretthewey, Stockton, Cal.  
769,968.—HEAD GATE FOR DITCHES—W. J. Warren, Modesto, Cal.  
770,137.—PAYING COMPOSITION—H. F. Williams, S. F.

## Extension of a Mining District.

The Leadville, Colorado, mining district is one of the most noted in the world, and also one of the most interesting, both geologically and mineralogically. In its early history Leadville was known as Oro City, a placer camp which grew up about the diggings in California gulch in 1860-61. Although the existence of lead carbonate ores was known for several years prior to 1877, no particular attention was given

become quartzite by crystallization of the infiltrated silica

Overlying the sediments, there was accumulated during the Glacial epoch a great thickness of glacial material derived from the neighboring mountains. This detritus occurred partly in the form of sediments, which were deposited on the floor of a fresh water lake that extended over the entire mining district, and partly as morainal material. During the Glacial epoch thousands of feet of sedimentary strata

part of the capital and enterprise of the district that until lately little effort has been made toward extending the known limits of the ore-bearing ground. The widespread cloak of glacial material has so effectually covered the rock formations that prospecting was rendered unusually unattractive, and shaft sinking has been discouraged in the absence of known ore by the large volume of water usually found. Within the past few months, however, several bore holes have been sunk on Rock hill, south of the city of Leadville,

Cyanide Plant of Black Hills Gold Mill, St. Louis Exposition. (See Page 225.)

these ores until that date. In 1876 a small shipment was made by wagon to a Denver smelter, and active prospecting over the entire region adjacent to Leadville followed in 1877, but the discovery of ore was in most instances an uncertain and disappointing task due to the peculiar geological conditions obtaining in this district, which lies at an altitude of over 10,000 feet near the headwaters of the Arkansas river. The ore-bearing formations are chiefly limestone and quartzite of Carboniferous, Silurian and Cambrian ages, interstratified with sheets of porphyry, the entire series resting upon the upturned schists and granite of the Archæan. Dikes of igneous rock cut the sedimentary rocks and the included sheets of porphyry. While lying at great depth and probably in a nearly horizontal position, these limestones and quartzites became ore bearing by the substitution of sulphides of iron, lead, zinc and copper for calcium carbonate, or by impregnation of the sandstones, which later

were eroded and the greater portion of the material carried away down the canyon of the Arkansas, the lake beds and moraines being the later evidences of glacial action.

Dynamic forces uplifted and faulted the strata, including the glacial lake beds. The lake was drained and the ore-bearing strata brought to and near the surface. Erosion continued, but the ore exposures were comparatively few and none of them prominent. The glacial sand, gravel and boulders of the lake bed and the drift still covered the greater portion of the district. These conditions would ordinarily have made prospecting slow, but with such feverish energy and haste was the work of search and development carried on that in 1880 the geology of the district was well understood, in a general way, and exploration continued unabated for some years. In more recent years, however, the mining and metallurgical problems have so completely absorbed the greater

and it is now known that the ore-bearing formations extend in that direction and underlie Rock hill and the adjacent territory. The Iron fault, one of the most important in the region, extends in a south-westerly direction through the new territory now being investigated, and farther west the Carbonate fault extends into the same territory in a nearly parallel direction. This may or may not prove to be of importance, but it is an interesting fact that some of the greatest and richest mines of the Leadville district lie on either side of the Carbonate fault, though it is a well recognized fact that the several faults of the region have no direct connection with ore deposition, and occurred long after the formation of the ore bodies. No ore of consequence has been found in the fault planes except that dragged in mechanically. The mineralization of the district, however, is so widespread that it lends color to probable occurrence of ore wherever the ore-bearing horizon may be found.

THE destruction of the Val Verde smelter at Val Verde, Yavapai county, Arizona, the present week by fire affords an object lesson in smelter practice, if the press dispatches correctly report the facts. It is stated that the furnace men tapped the slag hole of one of the furnaces and when ready to close the tap hole no clay balls were at hand with which to plug the hole. As a result the molten slag continued to flow and, overrunning the slag pots, spread over the wet floor. An explosion followed which caused the slag to communicate with the woodwork of the structure and set fire to the building. As a result the entire plant, valued at \$200,000, was destroyed. This suggests the wisdom of constructing smelter buildings of steel, employing wood about the works only where absolutely necessary. Other valuable lessons may be learned from a study of the situation and the conditions under which this occurred.

THE history of mining camps, like that of nations, repeats itself very often. The recent announcement that the once famous Tiptop silver district, near Castle creek, in southern Yavapai county, Arizona, is about to become a gold producer, occasions no surprise. For twenty years the miners of Colorado mined up Clear Creek to the top of the divide for silver, and there discovering gold, mined back for gold. Leadville, at first a gold placer camp, became a silver-lead producer, and is now a producer of gold, silver, lead and zinc. Butte City, Montana, was originally a silver camp. Eureka, Nevada, once a great silver-lead camp, is now producing gold, and so the list might be continued at length, but the localities and instances mentioned are merely indicative of the changes which time and opportunities bring. The poor low-grade mine of today becomes the profitable producer of to-morrow, because of the changed conditions, increase in knowledge and improvement in methods.

## Competitive Drilling Tests.

From time to time the mining journals and technical society publications print the results of competitive tests of various makes of machine drills. These so-called tests are usually made under uniform conditions at some place on the surface, but these artificial arrangements do not approximate the conditions found under ground in the mine. The artificial surface conditions prepared for the trial of durability, speed of cutting, facility of setting up and taking down the machine, cost of operating, and repairs, air consumption, and all other data which should be included in a bona fide test, and which would be of real value in determining the respective merit of the various machines on trial, usually consists of a large block of granite, rarely if ever over 30 inches thick, set horizontally. The drills are clamped to a horizontal bar; all holes are "down holes;" the limit of depth of hole is about 2½ feet; in fact, all of the physical conditions, although eminently fair and alike for each machine, are so totally unlike those found in the mine that a test of this kind has little of value in it. In mine work very few of the holes cut are drilled vertically downward—even in shaft sinking the greater number of holes are drilled at an angle, the end holes being the only ones usually to approximate the vertical. Some drills operate much more satisfactorily on down holes than others, and different sizes of the same make of machine give differing results in drilling down holes.

Another and important feature of test drilling is often noticed in the careful preparation of the machine to be used in the drilling contest. If these alterations, so carefully made at this time, are to the advantage of the drill—and they appear to be—why do not the manufacturers make the machine as perfect as this specially prepared drill? In a drilling contest there are several factors of importance, and upon these should the judgment be based as to their relative efficiency. Each machine should be of the kind sold to mining companies, just as they came from the shops; without extra care being given it in the finishing and polishing of cylinders, etc. The size of piston in each machine subjected to the test should be of the same diameter; the size of drill bit employed should be the same in each drill; the air pressure should be as nearly identical as it can be made; all holes should be drilled in the same direction and to a depth of not less than 4 feet. Short trials are of little value. Where miners have a drilling contest and drill single or double-handed, the quick work done at such times merely illustrates the result of physical training, and is an interesting exhibition of the skill and energy of the men, but in machine drilling such "spurts" are not tests of possibilities or of the enduring qualities of the machine, nor do they furnish any idea of the cost of keeping the drill in repair—an item of no small consequence. As a matter of fact, about the only "test" such trials demonstrate is the amount of free air consumed per minute. The only test which is worthy of consideration is that of continued work under the varied conditions found in the mine, and these extended over a period of at least a month, will afford, not only a knowledge of the drilling capacity of each machine, but also the expense of repairs, etc., which are a matter of important consideration. A recently published article in a technical journal gives as a record for a specially prepared machine drill, the cutting of 13,104 feet of holes drilled during a period of fourteen months (about 27 feet per day, which is a very low efficiency unless the rock drilled was extremely hard. A good machine should drill from 40 to 50 feet per shift in hard greenstone). The cost of repairs, etc., amounted to about \$33 per month, exclusive of \$45 expended in fitting up the machine for this special trial. These bills of expense are very heavy, and are not complimentary to either the drill nor the runner.

THE recent discoveries on Rock Hill, near Leadville, Colo., and those under the city of Leadville will do much to stimulate additional prospecting in that important district. These new and somewhat surprising finds indicate clearly how unsafe it is to assume what lies beneath the surface that has not been explored. Important new discoveries have also recently been made on the east side of the Mosquito

range, just over the divide from Leadville, that leads to the belief that a valuable series of ore deposits, similar geologically to those at Leadville, have been found. Although Leadville has been vigorously worked for over twenty-five years, it is evident that many surprises still await the more extensive exploration and development of that district. It is quite probable that exploration of the Cambrian quartzite will discover gold in that formation.

## Custom Works for Small Mines.

No factor in the development and prosperity of a mining town, district or region is of greater importance than a local custom plant for the treatment of ores. In a free-gold mining region nearly every mine is equipped with a mill, but there are districts where the veins are small and the rock high grade as compared with that of large bodies of what is generally recognized as low-grade ore. In some districts the ores produced are not free milling, and can only be economically treated by smelting. In either case, if the veins or ore bodies are of limited extent, a single property will not usually justify a mill or smelter, but several small mines may be able to keep a custom mill or smelter supplied continuously with ore. Blackhawk, Central City and Idaho Springs, Colorado, are noted instances of the advantage to be derived from the operation of custom mills. And Leadville furnishes an instance of the value of a custom smelter in the development and prosperity of a district. To become a success the custom reduction works must be conducted by competent and honest men. In the handling of smelting ores there is seldom a misunderstanding between miner and smelter, as all of the ore shipped to the smelter is crushed and sampled automatically, and is as fair for one as for the other, but the custom gold mill is seldom equipped with sampling devices, and both the miner and the mill man depend upon the plate and concentrator returns for a knowledge of the values in the ores. Many mills, both on custom work and those owned by the mine owner, are loosely run, and when such is the case disputes are of frequent occurrence. The miner usually overestimates the value of his ore, though not intending to do so. His method of sampling is faulty and usually leads to incorrect results. As a matter of fact the returns in amalgam and concentrates, with the value in the tailings, prove the gross value in the ore, but devices are not always at hand to properly sample the tailings and disputes arise, which are more or less difficult of adjustment. In most cases mills and smelters are carefully and honestly run, the owners being satisfied with the profit derived from the treatment charges. And their success in developing a camp suggests that there are many districts where custom works might be put in by the merchants and other property owners, aided by the miners themselves, and run to the advantage of all concerned. All acquainted with the mining regions of the West are familiar with the large benefits gained by those engaged in merchandising in a prosperous mining town or district. There are scattered throughout the West many districts which to-day are dull, though at one time active. The first enthusiasm is gone and the districts have settled down to a slow plodding life, and yet, all about are the elements of great success in the form of small veins of rich ore. The claims are owned by men of little or no means. They dislike to leave the district, and yet there seems little incentive to remain. If a custom mill or smelter were built to treat the ores of the idle mines, within a year the community would find that it was enjoying prosperity again—a real prosperity based on results and not on hopes. The mill or smelter should be run in such a manner as to warrant the confidence of the mine owners—moderate charges and honest dealing. This is all the miner expects, and if he gets it he is satisfied. Without doubt they who read the suggestions contained herein will call to mind at once several localities where the plan outlined is not only possible, but where it would prove a great success. It is an important matter familiar to all, but has simply been neglected. In this connection the proposition of a company organized at Globe, Ariz., to rent hoisting machines to small mines, and supply them with electric power, is one of interest, and the same thing might be done jointly with the establishment of custom mill or smelter.

## CONCENTRATES.

THE freight rate on structural iron from Pittsburg or New York to Spokane Wash., is \$1.23 per 100 pounds.

AT atmospheric pressure 13 cubic feet of air weigh one pound. Hence the air in a room, at sea level, 20x22 feet and 12 feet high, would weigh 406 pounds.

THE pressure per square inch at the bottom of a column pipe full of water on a slope 450 feet long at an angle of 42° would be 130.86 pounds per square inch.

FLUORINE GAS is exceedingly corrosive and will quickly corrode any metal except gold, platinum silver and lead. Hydrofluoric acid is usually kept in leaden or gutta percha bottles.

ALTHOUGH less power is required to compress air in high altitudes, owing to lower atmospheric pressure, when the air has been compressed to a given degree, say, 100 pounds per square inch, it is as effective in running a drill or a hoist as the same pressure at sea level.

SHEELITE is calcium tungstate—tungsten trioxide 80.6%, lime 19.4%. It can only be treated to advantage at a point distant from the railroad by concentrating on machines, and, if massive, require no concentration, it can only be shipped as it occurs in the vein or deposit.

WHEN locating a water right, the locator must divert all of the water he claims in his notice of location. He cannot take out a portion of the whole amount and later take a greater amount if others in the meantime have taken the surplus over the amount first diverted by the original locator.

IT is not uncommon to call an unknown rock "porphyry," and let it go at that. But "porphyry" is merely a word to describe the structure of a rock and has nothing to do with its mineral contents. Of course, this does not apply where the word is used with some qualifying term.

THE Suez canal is a salt water canal. The Panama canal will be a fresh water canal. The former is 30 feet deep. To accommodate a vessel of equal size the Panama canal will have to be a foot deeper. The biggest steamers to Australia from England do not pass through the Suez canal. The Panama canal commissioners say that canal will be 35 feet deep. That would admit a steamer drawing 32 feet in salt water.

A SUCTION DREDGER may justly be styled a hydraulic dredger. The velocity of flow in the discharge pipe of such a dredger would vary from 8 to 16 feet per second. High velocity of flow means greater friction in the pipe, and consequent greater power requirement. A fluid mixture of sand and water, or mud and water, is heavier than water alone. Hence it takes more power to pump such mixture against a given head and entails greater friction in the pipe.

THE theoretical value of chalcopryite (common yellow copper-iron sulphide) is 34.5% copper, 30.5% iron and 30% sulphur, but the ordinary ore rarely carries this value in copper, owing to the dissemination throughout its mass of pyrite, quartz and other impurities. An apparently clean ore sometimes contains only 10% copper, due to these foreign admixtures, which cannot readily be discerned by the naked eye. There is a tendency on the part of the inexperienced to overestimate the value of this kind of ore.

THE exposed blue print can probably be restored by immersing it in a bath of weak ammonia, using about two spoonfuls of ammonia to a tumblerful of water. This will cause the print to turn first purple, then pink and after a time nearly white. When it has reached the pink stage rinse it and immerse in a bath composed of one teaspoonful of hydrochloric acid in one tumblerful of water. The blue color will then return much brighter than before, but this time the lines will be white and clear. Wash the blue print thoroughly before drying.

WHERE the amalgam derived from quartz mill plates is low grade, due to the presence of bases, under existing circumstances it would be best to retort the amalgam in the usual manner, thereby recovering pure quicksilver and a "sponge" of gold alloyed with the bases. This latter should be shipped to a refinery, the mint or to some smelting company for refining, as the difficulties and possible losses in treatment at the mine would probably exceed the cost of refining. It is always advisable in such cases to melt the sponge from the retort into a bar.

IF no suitable foundation is obtainable for a heavy headframe on the surface near the shaft, pits should be sunk to bedrock or to solid "hardpan" and concrete or masonry foundations put in. It is more economical to provide such foundations at beginning of sinking with temporary hoisting engine and headframe, than to cover the site of the permanent construction with waste rock which must subsequently be removed in order to put in

substantial foundations. Experience has shown that it is unsatisfactory to build heavy structures of any sort on dumps, particularly when they lie upon a sidehill.

WHERE A locates a placer claim in 1900, but fails to perform the required assessment work, and B takes up A's forfeited claim, the use of the word relocate, in B's notice of relocation, does not invalidate B's claim. "A relocation impliedly admits the validity of the prior location," says Lindley on Mines. "There can be no relocation unless there has been a prior valid location, or something equivalent, of the same property. The courts draw a distinction between a locator and relocater, classifying the former as an original discoverer of mineral before unknown, and the latter as a mere appropriator of mineral discovered by another who had failed to exercise the privilege conferred on him by the law." Such being the case, the only inquiry is as to whether or not the original locator performed the requisite work.

THE occurrence of phonolite is no more indicative of the existence of gold ore than granite is. Gold occurs associated with phonolite at Cripple Creek, Colo., and in the Black Hills of South Dakota, but gold occurs in hundreds of other places far from any phonolite and there are numerous occurrences of phonolite where no gold is known to exist. Phonolite is a peculiar and not readily determinable rock. It derives its name from a peculiar physical and not mineralogical property—that of giving a ringing sound when thin slabs are struck with a hammer, but some other hard compact rocks possess this property in an almost equal degree, and this means of identifying phonolite is far from conclusive. It occurs in great dome-shaped masses, in injected sheets, as surface sheets, and lava flows, and in dikes. Some of the minerals characteristic of phonolite are rare in other rocks and not readily distinguished by those who are not capable of rock analysis, or who do not understand the microscopic examination of rocks.

THE first sign that timbers in a mine are taking great weight is noticeable in the joints where caps rest upon posts, or the ends of the stulls show signs of being crushed. Later the impending danger is usually indicated by the frequent dropping of small pieces of rock from the roof. When this stage is reached it is often too late to undertake to hold the ground in place. Sometimes it may be done by promptly reinforcing the timbers, but the safest and most satisfactory method is to fill the excavation as quickly as possible. Often this results in shutting off a body of rich ore, but after the filling has been run in and allowed to settle, it may be safer to drift through the "fill" and extract the ore than to attempt to remove it at the risk of caving the workings—for, already weak, the removal of more rock or ore is almost certain to bring disaster. In some instances it is less expensive and safer to reach the ore by driving a new drift or crosscut through the solid rock. This must be left to the judgment of the mine superintendent.

WHETHER or not it is advisable to strip the waste material from a placer claim before sluicing or otherwise attempting to move the payable dirt below depends upon the means at hand for doing it. If the ground can be worked by hydraulic method it will not pay to remove the soil, loam and low-grade gravel by any other method, but if it has to be shoveled it must be determined whether it be cheaper to ground-sluice it, or to shovel the waste into the boxes. If abundant water and sufficient fall be available ground sluicing is preferable. The overburden of quartz veins and other ore deposits may often be removed and sent down to the lower portion of the mine for filling. To make this possible the lower levels must be opened and connections made with the surface before the overburden is removed. In most cases the haste to realize on the most easily available ore results in attacking the surface deposits first. The overburden or hanging wall country is then removed and trammed to dumps, or elsewhere, and becomes useless for filling without extraordinary expense, as it involves the rehandling of the material and usually the cutting of special raises for passing the waste rock below.

IN attempting to concentrate black sand in sluice boxes, if the iron sand be abundant, the string of sluices must be long, or they will quickly fill and the riffles, for further concentration, are useless unless the sluices be cleaned up. It will probably be cheaper to put in long lines of boxes than to adopt any other method, and even then it may be necessary to clean up several times a day. Another method is to place a grizzly in the sluice which will permit only the fine sand, together with the iron, to pass, the coarse sand, pebbles and cobbles passing out into the tail race. The fine material passing the grizzly or screen can be conveyed to concentrating machines, operated by power derived from the sluice head, or otherwise, and thus the concentration of the black sand becomes automatic and continuous. The riffles of an ordinary 12-foot sluice box 12 inches wide will not contain, when full, more than about 100 pounds of clean black sand, the remainder of the space being taken up by voids and grains of quartz and other minerals. A sluice line of ten boxes would at this rate hold 1000 pounds of sand. Four men will shovel in about 30 to 35 tons of gravel per shift. If the material contains 5% black sand this would amount to 3500 pounds of black sand if it were all saved, but there is a

large percentage of loss of the finest sand by the sluicing method, the saving would probably not amount to over 2500 pounds of clean black sand. With the ten-box line it is evident that the cleanup must be made at least twice per shift, and as this operation consumes considerable time the day's output would be correspondingly reduced. In such case it were better to have a double line, if possible, and a length of boxes sufficient to hold all that can be concentrated in while the cleanup is in progress on the other line of sluices.

WHERE in making an excavation in earth to expose underlying rock in cutting a grade for a mill, the question of economy in moving the earth must be determined by conditions and the means readily obtainable to move the earth. If water under pressure is not available to hydraulic the earth away down to bedrock, it must be removed by mechanical means. On small jobs it is customary to use shovels and wheelbarrows, and usually this is as inexpensive as any other method; but if the amount of earth and loose rocks be large, it is more economical to use wheeled scrapers, if these be readily available. The work can then be done under contract by the owners of the scrapers and teams. Where these are not obtainable under proper conditions, it is a good plan to lay temporary tracks and put on mine dump cars. These can be quickly loaded by men shoveling on the several terraces of the grade, and, when filled, they can be trammed wherever desired by laying the track to that point and dumped. As the work progresses inward toward the hill, the tracks can be shifted over near the face by means of bars at any time. This method, if properly arranged and managed, is expeditious and economical, involving no long waits for cars or anything else. By laying shoveling floors near the face before barring, picking or shooting down the face of the bank, shoveling is made easy and much time saved. By using care, the same boards may be employed until the work is finished.

ZINC SULPHIDE (zincblende) contains sulphur 33%, zinc 67%. Zinc is a metal which causes much difficulty in lead smelting in the blast furnace, in whatever form it may occur. Zincblende is decomposed in the furnace by iron oxides and silicates, the zinc oxide resulting going into the slag; but the greater part of the zinc sulphide going into the furnace is not decomposed and goes into the matte as well as the slag, usually in about equal parts. It renders matte less fusible and causes other metallic sulphides to enter the slag and obstruct the separation. Where the percentage of zinc present is small, its evil influences can be corrected to a great extent by the addition of chalcopryite to the charge. If the ore contain a large percentage of zinc or zincblende—20% or more—it must first be roasted to change the zinc sulphide to zinc oxide, and, in order that the slag may take this amount of zinc up, the slag must be very fusible, as zinc silicate is of itself infusible, and this property renders less fusible the other silicates formed in the furnace. Metallic iron is not ordinarily employed as a flux in either lead or copper blast furnaces, though iron oxides (hematite and limonite) are largely employed for this purpose. Iron sulphides are not considered as a flux proper, but if present in large amount they will consume a large quantity of iron, and this must be added to the charge. The iron gives a base for combination with the silica in the ore. It is not a fact that all smelters lose 1.3% of copper when running, as the slags of many copper furnaces contain less than 0.5% copper, though a few may contain 2% or over, due to improper methods. The deduction of 1.3% copper is due to a custom which obtained in the early smelter practice in the West, when there was found a discrepancy of about this amount between assays and smelter returns.

THE Federal mining laws are the main guide of the miner in locating claims in California. There are, however, a few unimportant local and State laws. The Act of March 31, 1891, provided in part that "Wherever any mine owner, company or corporation shall have performed the labor and made the improvements required by law for the location and ownership of mining claims or lodes, such owner, company or corporation shall file, or cause to be filed, within thirty days after the time limited for performing such labor, or making such improvements, with the county recorder of deeds of the county in which the mine or claim is situated, particularly describing the labor performed or improvements made, and the value thereof, which affidavit shall be prima facie evidence of the facts therein stated. Upon the failure of any claimant or mine owner to comply with the conditions of this Act in the performance of labor, or making improvements upon any claim, mine or mining ground, the claim or mine upon which such failure occurred shall be open to relocation in the same manner as if no location of the same had ever been made." The Act then provides for the resumption of work and later filing the necessary affidavits, etc. In 1897 another Act more comprehensive in scope was passed. This Act repealed, by implication, the law of 1891. This last law was itself repealed in 1899, but owing to the peculiar phraseology of the repealing Act it was contended the Act was ineffectual, but the Supreme Court of California determined the Act valid. Meanwhile the Legislature passed a second repealing Act free from objectionable phraseology, and this left in force such of the provisions of the Act of 1891 as were not in conflict with the law of 1897. This Act took effect February 8, 1900. (Statutes of 1900, page 9.)

## A Proposition in Economics.

Written for the MINING AND SCIENTIFIC PRESS by  
H. E. WEST.

Some three years since an interesting problem came before the writer for advisement, and, as some of the factors and data therein may be of interest to others, possibly this may serve as an apology for bringing this subject forward.

The proposition was, in brief, whether it was advisable to capitalize further a property that had already a substantial sum to its debit, and which, after several years of desultory working, was then not meeting its costs, the hope of salvation lying in the possibility of more extensive operations and further equipment, with, in consequence, a reduction in working costs.

It will suffice to state that the mine in question is situated in the Western States; but, as the property is somewhat well known, it will not be advisable to be more explicit, except, perhaps, to add that working conditions, labor, etc., can be based on those existing to-day in the Cœur d'Alene mines of Idaho.

Briefly considered, the vein is a fault fissure along an anticlinal axis, traceable with practically unbroken continuity from 40 to 60 miles in length. There are prospect holes almost the entire distance, and one or two attempts at mining, that to the present have met with questionable, if any, success. It will be seen, therefore, with the section given, showing about 3 miles along the line of outcrop, that by nature the deposit is laid out for comprehensive working, if at all. It will also be noted that the workings have been confined to the south side of the middle gulch, since there the richest outcrops existed.

This site, unfortunately, being at the head of a steep canyon, whose walls rise 1000 feet on either hand, and blocked at the end by a mountain 3000 feet above the canyon, made a very unfavorable site for mine working and the camp generally for the greater part of the year, especially during the winter and spring, when danger from snowslides was ever imminent. Moreover, the additional thousand feet above the lowest exposure made a serious difference in getting supplies in and concentrates out. The haul to the railroad is 21 miles, with a difference in altitude of about 3000 feet. The grade of the ore was at that period too low to meet the adverse conditions successfully, the loss being about \$1 per ton of ore mined. The proposition was, therefore, as before stated, whether by installing more comprehensive working and equipment, and attacking the proposition from a more favorable base, the undertaking could not be made to yield results sufficiently satisfactory to induce additional capital to be provided.

The proposal of development was, in brief, as outlined in the section, viz., to sink the shaft (then at 200 feet) to meet the deep adit 4000 feet from the mouth and at a depth of about 1000 feet below tunnel No. 1; to install a concentrator capable of treating 600 tons per day. The concentrator would consist of two equal units.

Only one of the units to be provided, however, at first, to develop the water power higher up Creek No. 1, where ample water existed at all times for the complete working and lighting of the mine, plant and buildings. Also, in addition, to bring in a branch railroad from the main line, to materially reduce the cost of supplies and concentrates, which were freighted at \$10 and \$5 respectively, per ton. The camp would then be near the mouth of the deep adit, in a favorable position for working and habitation all the year round. So far so good. The next matter to determine was, whether the present development and past records warranted any such outlay. In the writer's opinion, clearly the most cautious plan would be to sink the shaft, say to the 500-foot level, and by drifting north and south to determine the extent and quality of the known ore shoot, which was developed in tunnel No. 1 for 1500 feet continuously, with the northern boundary still undefined; then, with the same grade of ore as that at present blocked out and with the same average width, the proposition could be shown to be payable; whereas, should the ore encountered prove either of higher grade or greater in quantity, so much the better.

A lower grade or diminished quantity would be distinctly unremunerative.

The length of the adit to be driven would be over 4000 feet. Roughly the cost of the proposition outlined would be:

Four thousand feet of adit at \$20 per foot.....	\$80,000
Eight hundred feet of shaft at \$30 per foot.....	24,000
Development, equipment, hoist, compressor, track, cars, etc..	50,000
	\$154,000
Mill, 600 tons per day, one unit.....	100,000
Hydro-electric installation.....	50,000
Camp buildings, roads, etc.....	20,000
	\$324,000
General expenses, etc., 10%.....	32,400
	\$356,400

Say, in round numbers, \$350,000.

If a railroad was justified, this would probably cost an additional \$100,000; thus, bringing the total required to \$450,000—a sum which is not usually found unless amply justified.

As similar propositions have been met and overcome at the Cœur d'Alene mines, the writer

accordingly visited the locality and spent some time examining into the special conditions relative to each prominent mine, ascertaining as far as possible, through the courtesy of the several officials, the cost required to meet and overcome same, with the financial results that had attended each.

The following tabulated statement may, therefore, be of interest, although it does not pretend to absolute accuracy; yet, at the same time, most of the essentials are sufficiently so for the case in hand, and also for comparative reference to others—and, as such, it is now offered. It may be noted, in passing, that the figures are a record for 1901, and in some instances are not up to date, though it is questionable whether any very large economies have since been effected, that is calculated at the cost per ton treated.

In this table may be seen the comparative statements under the several heads, compared with each other and the mine under review. With regard to the grade of the ore, there is not much difference between the lower grade mines—but one marked difference manifests itself, and that is the tonnage of the ore treated per day. Generally speaking, a

the pitch being probably to the north, so that, judging from the outcrop, there is no great expectation of cutting any considerable body of ore in the adit. Now, as to the width of the veins. It is seen that all the veins in the Cœur d'Alene system are considerably wider than that of the Competitor, whose width is, on the average, possibly 4 feet, although this is the outside limit. Hence, to maintain an output of say 300 to 400 tons per day even—not to mention 600 tons—a very considerable length of stoping ground must needs be opened up; and, with this output, the available ground above the deep adit would be stoped out in about three and a half to four years. The block of ground that might reasonably be relied on would measure 1500x4x1000 feet, or about 500,000 tons. Below this level all is problematical and cannot be advisedly enter into the calculation.

The chances are that a vein between sedimentary rock (shales and limestones) with such a considerable thickness of these bands, shown by the tilted strata, might live to a reasonable depth. Now, with regard to profits and cost of production:

In the past this is given at \$3.23 per ton of ore mined and treated, including all general costs, but

Sketch Showing General Features of Anticline, and Vein at Axis.

Cross Section of Competitor Vein.

Sketch of Competitor Mines.

lower tonnage demands an increased ore value, and this is also true for this particular camp, for, in the early days, when tonnage was small, in such mines as the Bunker Hill & Sullivan there were deposits of easily worked lead carbonates that were shipped direct, and the early sulphides worked concentrated possibly four to one. Or, looking at the matter in another light, were the output to be cut to 150 tons per day, would these mines, with all their facilities and efficient mills, be able to subsist on a feed of 6% to 7% lead? The answer is undoubtedly in the negative. Certain mines, doubtless, paid their way from the surface down, but others, notably the Morning mine, one of the lower grade mines, experienced many reverses in its early days, and it was not until a large output was put through, necessitating a very considerable capital outlay, that the mine paid its way—and, even at the date of the writer's visit, it is doubtful whether there was an actual profit per ton of ore treated of over 75 cents, although with the completion of tunnel No. 6—virtually a deep adit—this might be increased to \$1.25 per ton. So it is, beyond doubt, the tonnage which tells in such propositions. With the considerable amount of ore developed and probably encountered these mines can afford to drive crosscuts through barren ground for 2 miles or over, and also to install large mills and all requisite machinery for efficient mining, so that the total costs shall be reduced to the lowest point—for without these economies, as has been intimated, these profits would diminish, and, in some cases, possibly disappear.

The question, therefore, resolves itself into tonnage.

The proved ore shoot in the Competitor mine is 1500 feet in length, with its northern limit undetermined—

without depreciation charges, etc. This figure is considerably more than the average of the comparative mines, but still a fair showing, considering the many disadvantages. As to grade of ore, there was developed below tunnel No. 1 about 30,000 tons of ore, averaging the following contents:

Lead, 6.8% — 136 pounds, at 4 cents per pound.....	\$5.44
Silver, 3.2 ounces, at 50 cents per ounce.....	1.60
Gold, \$1.....	1.00
Total.....	\$8.04
	Smelter Discount. Mill Loss
Lead.....	\$5.44 less 10% = \$4.90 less 20% = \$3.92
Silver.....	1.60 less 5% = 1.52 less 25% = 1.14
Gold.....	1.00 less 5% = 0.95 less 30% = 0.65
Total value.....	\$5.71
Nominal mine value.....	\$8.04
Smelter value.....	7.24
Mine value (actual).....	5.71

We, therefore, see our ore considerably shrinks in value, through factors in all probability beyond control, and our \$8.04 ore becomes \$5.71, which has to stand all costs of mining, milling and smelting.

With a ratio of concentration of 10 to 1, that seems reasonable to assume, and is in accordance with practice elsewhere on similar grade ore,

$\$5.71 \times 10 = \$57.10$  per ton of concentrates.

### OPERATING COSTS.

Mining and milling, etc., 10 tons of ore, at \$3 per ton.....	\$30.00
Freight from mine.....	1.50
Freight and treatment.....	18.00
	\$49.50
Value per ton of concentrates.....	\$57.10
Cost per ton of concentrates.....	49.50
Profit per ton of concentrates.....	7.60
Or 78 cents per ton.	

Of course, as a matter of fact, there would be two grades of concentrates produced, coarse and slime,

COMPARATIVE STATEMENTS REGARDING THE CEUR D'ALENE AND THE COMPETITOR MINES UNDER CONDITIONS EXISTING IN 1901

- 1—(Bunker Hill Sullivan.—Ore occurrence unique, lenses of ore 100' in width and up to 250' in length occurring as enlargements or branches making into the hanging. Ore occurs mostly in masses distributed throughout the vein. A long crosscut over 2 miles in length at \$20 per foot now being driven, connecting mill with mine, giving rise to additional "baes."
- 2—(Tiger Promont.—Banded, worked through main shaft situated near bottom of canyon close to mine.
- 3—Standard.—Ore occurs in vein mostly in two seams, one against either wall, the middle portion being used for filling between square sets. Main entrance by Campbell crosscut, 3000 feet long. Estimated at about \$1 per ton.
- 4—(Pisco.—The vein is banded. It was richer in the upper workings. The large quantity of zinc somewhat interferes with milling and deprecitates concentrate produced. There is no coarse slag ore in the mine.
- 5—(Morning.—There are two veins, "Morning" and "You Like." The former narrower but richer. Total cost per ton \$2.57 from \$3.27 net value of the concentrates gives 70 cents per ton profit, which will be increased later to \$1.25 when the 2-mile crosscut is finished.
- 6—(Competitor.—The vein is a banded quartz vein, with spathic iron. The galena occurs more or less throughout, almost always intimately mixed with the quartz, thus rendering coarse concentration usually impossible—culling for fine grinding with the corresponding loss of silimed galena. The loss per ton of ore treated was \$1.

NOTE.—The output for 1900 from the Cœur d'Alenes mines for ore and concentrates was 175,000 tons. Lead 56%; silver 36 ounces.

b—Difficulty of high extraction of metallic contents, owing to the unusually intimate association of the economic minerals with the gangue of the vein, chiefly quartz, spathic iron, blende, etc.

The selling value of the mine manifestly cannot be demonstrated to be anything near the amount already sunk in the property, therefore, unless additional capital is forthcoming, there must be a loss. And with further capital we are confronted with two possibilities: either the additional loss—total or in part—or, on the other hand, the return of the additional outlay, the expenses to date, and a reasonable interest on the total period of operation.

Written for the MINING AND SCIENTIFIC PRESS by  
G. E. BAILEY, E. M.

Many of these smaller occurrences are much nearer existing main lines of transportation than any of the large ones, and, if worked, could be made valuable feeders to the centrally located refining works. The refining cost at such works must always be much less than at those situated on the shores of the large lakes. It should cost no more to produce the crude material at the smaller places than at the larger ones, and may cost even less. The difference to be considered is the increased cost of transportation to the refinery, and it will be found that the well-situated central works could afford to pay this and still compete with those at the source of supply.

It is a fact, also, that the Pacific Borax Company have built a larger refinery at Bayonne, N. J., than they have at Alameda or Marion, Cal. The dense populations of the Eastern States are to-day the main consumers; but the Western consumption is steadily increasing, and with its increase will come more Western chemical works. It requires considerable capital and expensive plants to go into the borax or soda business. It also requires a high grade of chemical and technical knowledge to boil the crude material and separate the borax, carbonates of soda, sulphate of soda and salt from each other by fractional crystallization. These facts show that it is not a poor man's proposition, like placer mining. The situation is summed up as follows in Bulletin No. 24:

Nature has been bountiful in giving to California salines which await the union of capital and technical skill to become valuable producers of State and national wealth. The main source of this wealth of natural soda, borax, niter, etc., are the alkaline lakes, "dry deposits, and beach lines of the Great Basin. The technology of the salines has its special difficulties, since laboratory experiments on a small scale, no matter how carefully conducted, can rarely reproduce the condition existing in large masses of the raw material. As these difficulties have to be met by the scientific specialist, and not by the prospector, it was not thought necessary to do more than note a few points in connection with the many processes. At a later date a bulletin on this subject would be of value to those engaged in developing these resources. It would seem that the time must soon come when these vast resources will attract the serious attention of capital and business enterprise. The path is open. The general chemical lines are already well known, and the engineering problems, while numerous, are neither very complex nor very difficult. Through the present steady development of transportation facilities, the arid region will soon become the seat of new, great and prosperous industries. That these deposits will be developed is not doubtful to any one who knows the activity and enterprise of our people.

IMPROVED PROCESSES.—The history of the borax in-

dustry shows that at first only high-grade portions of the dry lakes were worked; just as in the days of '49 only the richest gold placers were developed. Speaking of these early days (1872) Bulletin 24 says:

The prospectors, however, have been aroused to interest in the mineral that was worth over \$600 per ton and "only had to be shoveled up to be ready for the market," and discoveries in the deserts of California and Nevada followed each other with bewildering rapidity. In 1873 San Bernardino county began her big record with the production of 515 tons from the so-called borax "marshes," or the "dry lakes," of the desert. Inyo county soon followed in lively rivalry, and the high-water mark of the early years was reached in 1876, when 1437 tons were produced, worth at that time over \$312,000.

### Pelton Water Wheel at the St. Louis Exposition.

The exhibit of the Pelton Water Wheel Company at the Louisiana Purchase Exposition aims to demonstrate graphically certain hydraulic theories which have heretofore been deduced only from calculations.

The impulse wheel consists essentially of a cast iron or steel center to the periphery of which are affixed cups or buckets. Water under pressure is allowed to impinge on these buckets, causing the wheel to revolve with the shaft on which it is mounted. The efficiency of a wheel of the Pelton type is largely due to the shape of the bucket. The bucket and the action of the water upon it naturally engage attention.

To obtain a complete reversal of the stream, with practical absence of velocity, it is essential that the bucket be divided into two parts by a wedge or splitter on which the stream might strike. (See Fig. 1.) The stream of water is thus divided, the

Fig. 1.—4000 H. P. Pelton Wheel, Showing General Bucket Design and Construction.

two halves following the curvature of the bucket and discharging backward and downward at a slight angle, so as to avoid interference with the succeeding bucket. To obtain this result it is necessary that the bucket curves be laid on lines of the least resistance and that the splitter bear a certain relation to the bucket sides.

In designing a water wheel bucket and attempting to carry out a particular theory it is, of course, necessary to lay out the bucket shape mathematically, and then, following well known hydraulic laws with regard to the flow of water on surfaces, note the curves and paths which the stream should follow. This plan has been productive of good results; but most of the hydraulic laws referred to were deduced from observations of water action against stationary surfaces; or, if moving, the path of the water was so obscured by spray and the moving wheel that the observations have in some cases led to mistaken theories, which are now disproved in actual practice.

The problem is, then, to observe the action of water on moving surfaces as though they are standing still. This is accomplished by applying the "skobiscopic" principle to the observation of a water wheel in actual operation, which principle may be described as being the reverse of the kinetoscope, in that moving objects are seen as stationary, instead of apparent motion being given to stationary objects. The general principle is that if a moving object be illuminated at fixed

intervals by rays of light admitted at the moment the object passes a desired position, each portion of the object will be observed as though it were stationary.

In Fig. 2 is exhibited the apparatus, consisting of a Pelton water wheel 20 inches in diameter mounted on the shaft overhang of a General Electric generator. The water impinges on the wheel through a needle nozzle, the pressure being supplied by a centrifugal pump. The luminant is a General Electric searchlight projector with automatic focal point control, which is located beneath the apparatus, and which by a system of mirrors throws its rays into the wheel housing through the glass bottom. In its normal position the light is thrown direct on the wheel, under which condition the wheel may be seen revolving and the water discharging from the buckets in apparent confusion. Interposed between the searchlight and the wheel is a sheet iron disc with radial slots, which disc is revolved by means of a gearing at a speed proportional to that of the wheel, and when the searchlight is automatically brought into its upper position the light is thrown on the wheel through these revolving slots, and thus the wheel is illuminated at fixed intervals, and one sees the wheel apparently standing still and can observe the action of the water and trace the path of the jet from its entering the bucket to its reversal and clearance of the succeeding bucket without interference.

The apparatus presented is for exhibition purposes only, and to obtain practical results the Pelton

Fig. 2.—General View of "Skobiscopic" Apparatus.

Fig. 3.—A Stream of Water From a Pelton Needle Nozzle.

Water Wheel Company has a permanent installation on a large scale in its San Francisco laboratory, where exhaustive experiments are conducted. Not relying on visual observations alone, resort is had to photography as a permanent aid in studying the action of the water on the buckets. In this laboratory also are instruments of precision for determining the relative efficiencies of different bucket shapes.

Regulation of any water wheel is necessarily at the expense of efficiency. In most cases it is accomplished by throttling the water by means of a gate, which materially reduces the working pressure. The Pelton needle nozzle (see Fig. 3) is an efficient device. The needle nozzle consists of a conical-shaped tip, in which is inserted a concentric-tapered plug or needle, generally similar in shape to a "plum-bob." A change of position of this plug causes a corresponding change of discharge area in the nozzle; the amount of water used is thus varied and the power of the wheel influenced proportionally.

The peculiar curves of the needle and tip admit of the water changing its velocity gradually and uniformly, and the stream diameter may be varied from about one-tenth to full area without changing its circular form or losing its density. The combination needle and deflecting nozzle, embracing both features in one nozzle, is deemed particularly effective in its results when varying loads are met with at certain periods in the day's run.

### A Hot-Blast Smelter.

Herewith is illustrated a shaft furnace for semi-pyritic smelting, which the inventor says is built to handle lead, copper or gold ores, with the proper variation of fluxes and adjustment of tuyere openings. Test runs are at present being made on the treatment of gold-bearing vanner concentrates consisting mainly of pyrite, but which, due to exposure, are more or less oxidized, there being barely enough sulphur present to form a matte. With this class of material about 5% of coke is required in the charge. With increase in the sulphur content the quantity of coke may be reduced, as the excess sulphur (over that required to form a matte) will serve as fuel.

The distinctive feature claimed for this furnace is the arrangement of the hot-blast system. The hot gases resulting from combustion in the furnace are drawn out by a suction fan, through a pipe contained within the air-blast pipe (seen in upper left side of the cut). By this means the air, before reaching the tuyeres, is heated, as the incoming air is in contact with and entirely surrounds the pipe carrying

The Vencedora Hot-Blast Smelter.

the exhaust gases. This effects economy in fuel and makes the furnace especially applicable to mines at some distance from cheap transportation. Such a mine could smelt its gold-bearing concentrates at the mine and ship an enriched iron matte. Charcoal may be used instead of coke.

To facilitate feeding, the concentrates are briquetted with about 10% of lime. The furnace shown in the engraving has a capacity of five to ten tons per twenty-four hours, and fifty pounds of ore and flux are charged at a time. Furnaces are built to handle up to and over fifty tons daily. The four vertical pipes outside the shaft of the furnace carry the blast to the tuyeres. The shaft of the furnace is water-jacketed. The tuyeres consist of a succession of holes in plates (each an arc of the furnace shaft's circle), each plate being readily removable, so as to carry larger or smaller holes, according to the amount of air desired. Because of the hot blast and the suction fan drawing off the waste gases, it is said that but three to five ounces pressure is used on the blast. The auriferous sulphides are concentrated (about ten into one on the first operation) into an iron matte. If desired, this matte may be resmelted by breaking up and charging with quartz, further concentrating the gold values. The matte and slag are drawn off, from time to time, from the upper of the two tap holes. The crucible or lower part of the furnace is detachable. In handling copper ores the tuyeres may be manipulated, says the inventor, so as to produce copper bullion in the first operation.

These furnaces are being manufactured by the Vencedora Mine Equipment Co., of which W. C. Ralston, 331 Pine street, San Francisco, Cal., is president and manager. The smelter may be seen in operation at the Fulton Iron Works, San Francisco, Cal.

Crushing in Cyanide Solution as Carried on in the Black Hills, S. D.\*

NUMBER II

Written by C. H. FULTON.

THE COST OF SHOES AND DIES OF DIFFERENT MATERIALS.—Shoes weigh 180 pounds and dies 120 to 140 pounds. Laid down at Terry, S. D., chrome steel costs 5.83 cents per pound, forged steel 5.72 cents per pound, cast iron 3.5 cents per pound.

TABLE III

NAME OF MILL.	Name of Part.	Material.	Tons of Ore Crushed.	Number of Days Used.	Cost per Ton of Ore Crushed—Cents.

Horseshoe.	Die	Forged steel.	340	85	2 85

The Dakota mill also uses chrome steel shoes and is experimenting with a cast iron die containing 20% of chrome steel scrap, made at a local foundry, which costs 3.5 cents per pound laid down at the mill. Dies

FIG. 1.

FIG. 2.

of this kind weighed 120 pounds and lasted forty-six days, crushing 175 tons of ore, and leave 14 pounds of scrap, which is sold at 0.5 cent per pound.

At the Lundborg, Dorr & Wilson mill at Terry a 6-foot roller mill is used to crush in cyanide solution in place of stamps. This mill crushes about 70 to 90 tons of ore per day, from 0.75-inch size through an 18-mesh screen, 0.046-inch space. The mill makes thirty-two revolutions per minute and has 19.5 square feet of screen area. A peculiar feature in

Alta Mines Co., Mill and Tramway, San Miguel County, Colo. (See Page 230.)

the wear of this mill is that both the die ring and the roller tire cup on wearing. Instead of the die cupping and tire crowning. This, however, does not seem to affect the efficiency of the crushing. This mill is giving satisfaction, but no figures are as yet available to afford a comparison between it and the stamps on siliceous ore. It might be stated that the ores crushed at this mill are in part comparatively soft, although some hard, blue quartzite ores are also being crushed.

The cyanide solution is introduced into the batteries at most of the mills by two 1.5-inch pipes entering at the front of the battery between the first and second and the third and fourth stamps. Each pipe is controlled by an iron cock.

At two of the mills a special form of mortar is used, having a cast iron collecting launder bolted on at the front, and having a central discharge into the main launder, collecting the sludge from all the batteries. This mortar is shown in Figs. 1 and 2, which also give the form and dimensions of the mortar used at the Maitland mill. Generally all the screens are overhung with heavy canvas to avoid splash.

(TO BE CONTINUED.)

Open-Door Rotary Crusher.

A new rotary crusher is manufactured by the Sturtevant Mill Co., illustrated herewith. It is called

and other uncrushable material that gets into this class of machines may be easily removed. The heaviest wearing parts, although massive, are small enough to be lifted out by hand.

Rotary crushers are great producers of finely broken materials of moderate hardness, crushing cheaply and fine.

This open-door crusher is a very large machine. "The vertical shaft carries only its own weight and that of the driving gear, and its foot runs in a large oil-pot bearing thoroughly protected from dust. The crushing cones are supported from the top by large ball-bearings, which greatly promotes easy running and durability. This cone may be raised or lowered by the screw at the top. The range of adjustments for wear or to size output is unusually large. The scrapers require no change, except replacement for wear, and are conveniently reached without dismantling the machine. The cast steel bevel pinion shaft is supported from the inner end, giving great strength to this important part. Discharges are from three sides. The door bolts are removed from slots, a single turn of each nut allowing speedy removal. Thus the door may be opened as easily as the door of a steel safe and swung entirely out of the way, giving full access to the interior of the crusher. Removal of any part is therefore easy. The case is not weakened by the door, which, held by its bolts, is rigid and secure. Having no flywheel, this crusher is not subject to breaking flywheel shocks in case of sudden stoppage. This danger is avoided, and yet

Open-Door Rotary Crusher.

the Open-Door rotary fine crusher, and its massive door, swinging wide as easily as the great door of a large safe, exposes all its wearing parts to quick inspection and removal. Railway links, coupling pins

the machine has abundant power for any work. Every part of the open-door crusher is massive; the main shaft is 7 inches in diameter and in every way reliable." The Sturtevant Mill Co. of Boston, Mass.,

\*Bulletin No. 7, South Dakota School of Mines.

have issued their 1905 Catalogue No. 12, showing and describing these rotary crushers and eight other types of rock crushers; also rolls, mills, screens, engines, boilers, etc., and will gladly mail it to interested parties.

### Gold Reduction Plant at the World's Fair.\*

[FROM A SPECIAL CORRESPONDENT.]

S. W. Russell of Deadwood, S. D., president of the South Dakota Commission to the Louisiana Purchase Exposition and of the Black Hills Mining Men's Association, made the opening address at the dedication of the Black Hills gold reduction plant in the mining gulch at the World's Fair on August 25th. Mr. Russell said in part: "The center of the world's civilization, of its progress, its arts and sciences, has been brought this year to St. Louis, and as I look about me and see the faces of many of those who have brought this magnificent triumph to our nation, I realize that this plain, unpretentious little building, has become for me to-day the finest palace in all the world. \* \* \* President Francis, in presenting this exhibit, I not only do so as president of the South Dakota Commission, but especially as the representative of the Black Hills Mining Men's Association, for it is this Association that makes the exhibit. I realized that my commission could not, in justice to the other State interests, undertake an exhibit of this magnitude, the cost of which would well nigh equal the whole State appropriation, but desiring to put into effect Dr. Holmes' plans for a practical gold milling plant and knowing that I had the support of the Black Hills Mining Men's Association, this standard, up-to-date gold plant, supplied with Black Hills gold ore, greets you to-day. In this plant we will show you how modern science and business methods and careful practice enable us to mine our ores at a profit; to hoist, stamp and treat them so that by extracting only from a third to a sixth of an ounce of gold from a ton of rock, we cause our companies to pay their dividends. \* \* \* For the Association and the State I desire to extend our thanks to the makers of this machinery, the Colorado Iron Works Co. of Denver, Colo., who have generously assisted us, and to you, sir, and to Director of Exhibits Skiff, and to Dr. Holmes, and to all those connected with the Exposition, I desire to express our appreciation."

President Roosevelt sent the following message to Mr. Russell:

Through you I send cordial greetings to the Black Hills Mining Men's Association and best wishes for the successful opening of your gold reduction plant. I heartily congratulate you and the Association on the establishment of your interesting exhibit.

THEODORE ROOSEVELT.

Governor Herried of South Dakota wired as follows, also to Mr. Russell:

Congratulations on the opening of the gold reduction plant representing one of the various industries of one of the youngest, but best States, having the largest gold mine and richest 100 square miles on earth.

Other telegrams were read from Congressman Burke and A. B. Kittredge and E. W. Martin.

\*See illustration on front page.

Stamps and Plates of the Black Hills Gold Mill at St. Louis Exposition.

President Francis, the next speaker, then said in part: "In rising to accept on behalf of the Exposition I did not pay proper tribute to the enterprise and company this characteristic exhibit \* \* \* I would be untrue to my own feelings and unjust to you if I did not pay proper tribute to the enterprise and the perseverance which you, sir (Mr. Russell), have

The Black Hills Gold Mill at the St. Louis Exposition.

brought to bear to install this exhibit. I accept, on behalf of the Exposition company, this most interesting exhibit. It is a component part of a great universal exposition, an exposition which comprises all the best products of all the civilized people upon the globe, but no exhibition held in America to-day, characteristic of the products and the progress of the country would be complete that failed to show the processes by which this very important contribution to the wealth of our country is realized. I make the prediction that this gold reduction plant will be one of the interesting features of the Exposition from now until its close. I felicitate you, the people of South Dakota, and the Colorado Iron Works Co. upon this excellent installation."

Director of Exhibits Skiff, in concluding the exercises, said: "The roof under which we are gathered to-day is not unfamiliar to me in its purposes, at least, and from what an observing and experienced

feeder, hanging pattern, and after being crushed passes through the screens (which are changed from time to time as the ore varies in character), the mortar being of the single issue Homestake pattern. The mill is equipped for compound ore treatment; either wet stamping with cyanide solution and treatment of sands and slimes separately, or wet crushing with water, and amalgamation and concentration following. In the latter process the pulp passes over 12 feet of silver-plated coppers (three plates each 48x54 inches in terrace), the plate washings being concentrated on a 1904 (No. 5) model of the Bartlett concentrating table. In the wet stamping cyanide treatment the pulp is conveyed by launder to a sump and elevated therefrom by a 54x6-inch Frenier sand pump to two C. I. W. type of standard hydraulic classifiers 30 inches and 20 inches, respectively, when the separation of the sands and slimes takes place. The sands flow to the automatic distributors over the

represents the Colorado Iron Works Co. S. W. Russell selected the various ores that will be treated in the mill from different mines in the Black Hills gold district, and it is estimated that when all shall have been crushed that the net bullion returns will be about \$10,000. Altogether the mill in operation was pronounced a most interesting and instructive feature of the great Exposition.

Mining Gulch, World's Fair, St. Louis, Aug. 26.

### The "Semi-Diamond" Tool.

An emery wheel dresser, manufactured by the International Specialty Co., 35 Holden Avenue, Detroit, Mich., is designed by them to take the place of the black diamond. They write that it will do the work of truing and shaping emery wheels in as satisfactory a manner as the diamond dresser. The "Semi-

Concentrator Floor of Black Hills Gold Mill at St Louis Exposition.

gentleman from California has said, it appears to me that it can be generally challenged that this is the most perfectly equipped extraction plant that the ordinary visitor to mining camps and localities has seen. \* \* \* There is probably no exhibit on these grounds that more thoroughly meets the hopes of the Exposition management in placing product and process in juxtaposition than this. To what extent this exhibit may point the young man without ambition and the unemployed to the unknown and unexplored territories of mineral-bearing country to the west and northwest, is, of course, problematical, but that these exhibits, instructive of the industries of men and of wealth waiting upon effort are of distinct influences on the march of civilization cannot be denied. I am grateful for the opportunity of being present to-day. I am glad to receive this structure and this exhibit at the hands of our president, and in surrendering it into the custody of Chief Holmes I am passing it to strong and grateful hands."

An inspection of the plant following showed that the ore to be reduced is received at the highest point of the mill and tumbled into a large ore bin, from whence it is fed into a standard pattern 7x10-inch Blake crusher, the product being crushed to pass a 1½-inch ring. The ore then passes to a large bin back of the battery of five stamps, each of which weighs 1000 pounds, and drops 8 inches at the rate of ninety times per minute. The ore is fed to the stamps by a C. I. W. type of Challenge (eclipsed) ore

steel sand tanks, of which there are two, each 12 feet by 3 feet 6 inches, and equipped with separate air and leaching pipes, overflow launders, and sectional filter bottoms. The filtering medium is No. 2 cocoa matting, rope being used for caulking. The residues after treatment are discharged by flushing through 10-inch side gates. The gold solution which percolates through is conveyed by the leaching pipes to the 7x4-foot gold solution tank, from whence it flows through a 10-foot Webb precipitate box, zinc being used as precipitant. It is here that the gold is deposited and the spent solution flows to the sump tank, which is 10x4 feet. The slimes after separation pass directly to two 8x6-foot slime tanks, also steel, where they receive the agitation (air treatment). The supernatant solution after settling is decanted by means of decanting pipe and cocks at various levels into the gold tank also. The slimes tailings are flushed out the same as the sands residues, through 10-inch side discharge gates. The solution pump in use has a 2-inch suction and 1½-inch discharge, and is of the triplex type. The usual methods of refining the precipitate in practice at leading plants are followed. The equipment of the plant is completed with a 6x6-inch belt driven air compressor, zinc lathe and 20 H. P. motor, which furnishes the power. The mill is in operation about ten hours per day under the management of B. C. Cook, late of the Portland company in the "Hills," and a pioneer "wet crushing" cyanide man. R. P. Akins

Diamond" dresser is a steel tube filled with a hard abrasive, presenting new cutting edges the entire length of the tube as long as it lasts, which, they say,

"Semi-Diamond" Emery Wheel Dresser.

is from three to five years with ordinary use. The dresser is not recommended for water grinders or very hard wheels, although it can be used on such if necessary. Its efficiency is best demonstrated on grades up to medium hard.

In addition to the ore discovered on Rock hill, new strikes of importance are reported in the heart of the city of Leadville, Colo.; in what is known as the downtown district, in view of which other discoveries are anticipated.

## Mining and Metallurgical Patents.

PATENTS ISSUED SEPTEMBER 20, 1904.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

AMALGAMATING MACHINE.—No. 770,290; F. J. Hoyt, Chicago, Ill.

Combination with air tube having air mover at one end and nozzle at other end and funnel under nozzle of bowl and globe in bowl semi-submerged in mercury, and casing around globe supporting funnel.

SEPARATION OF METALS FROM THEIR ORES.—No. 770,659; J. B. Scammell, London, England.

Process of separating metals from ores which consists in bringing finely ground ore suspended in water into contact with chloride of sulphur diluted with oily or greasy matter, agitating mixture whereby metallic particles combine with sulpho-chlorinated oil, skimming off from mixture compound of metal, chloride of sulphur and oil which floats and separating grease or oil in order that it may be employed again.

FURNACE FEEDER.—No. 770,701; J. Roger, Denver, Colo.

In apparatus of class described, ore feeding element comprising body member provided with plurality of rigid depending blades or hoes, means for

actuating successively downward, forward, upward, and retracting movement of element, and means for delivering material between blades.

METHOD OF BLASTING.—No. 770,459; C. O. Frye, Joplin, Mo.

Method of blasting, which consists in exploding compression charge in proximity to surface in which blasting charge is embedded, with body of air between it and surface, explosion of compression charge taking place at time of upheaval produced by blasting charge.

JACK FOR MINING MACHINES.—No. 770,607; M. Raines, Decota, W. Va.

A jack for mining machines, comprising pivoted adjustable jack pipe, and means for locking jack pipe against pivotal motion with respect to body of jack; means for pivotally connecting jack pipe with body, pivoted lever and locking pin connected with lever and adapted to lock means against pivotal motion.

ORE CONCENTRATOR.—No. 770,283; A. Guionneau, Denver, Colo.

In reciprocating table concentrator, flat, smooth table surface provided with several rows of inverted

conical cups extending from head end portion of table throughout portion of each table's length, each row of cups being connected together with sunken groove or raffle.

MINE CAR.—No. 770,498; W. E. Hamilton, Zanesville, Ohio.

Mine car comprising side and end walls, one of walls having opening therein adapted to receive part of loading machine, and means on wall normally projecting into opening to engage part to couple car and loading machine together.

DETACHABLE TOOL HANDLE.—No. 770,413; W. Ashert, Des Moines, Iowa.

Handle socket, tapered head thereon having transverse opening, nut in tapered head, in one position contained wholly within head and in another position having its sides projecting beyond head and screw rotatably mounted in head and passed through nut, and means for locking nut in position with its sides projecting beyond head.

MINING MACHINE.—No. 770,286; W. E. Hamilton, Zanesville, Ohio.

Mining machine comprising movable platform, radial frame pivotally mounted on platform, cutting mechanism and breaking mechanism mounted on forward end of frame and loading mechanism movably mounted on movable platform and detachably connected at forward end with forward end of frame in such manner that loading mechanism projects beneath and moves with breaking mechanism.

THE Department of Commerce and Labor reports that the coal production of the country has increased from 152,447,791 tons in 1894 to 319,068,229 tons in 1903, according to the preliminary figures of the Geological Survey, having thus more than doubled during that period, while the increase in coal exportation during that time was less than 3,000,000 tons. The production of pig iron has increased from less than 7,000,000 tons in 1894 to 18,000,000 tons in 1903, yet the exportation of pig iron in 1903 was only about 18,000 tons, indicating that practically all of the enormously increased production was utilized at home for the manufacture of finished products of iron and steel, of which the exportations have grown from \$29,220,264 in 1894 to \$111,948,586 in 1904.

MINERS are engaged in driving a tunnel under Silver Dollar lake, near Georgetown, Colo., the object being to tap the lake 30 feet below the surface for power purposes. The undertaking is one of great risk as the workmen approach the flow of the lake. They have already passed out of the solid granite into broken rock.

# Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE  
MINING AND SCIENTIFIC PRESS.

## ARIZONA.

### Cochise County.

B. W. Clair reports opening up a vein of ore in his Empire State mine, showing 30 inches of shipping ore that will run \$60 per ton, and has a large body of low-grade ore that will concentrate. This find is on the 100-foot level in the drift. Clair is stopping ore and getting ready to ship. R. L. Taylor, in the same district, is working his Mountain Beauty and has cut 12 feet of copper ore. These mines are 17 and 19 miles from San Simon, on the Southern Pacific Railroad, and as there is timber and water the ore can be worked cheaply. The Clair body is lead ore, but carries values in silver and gold, and the vein is 20 feet wide.

### Graham County.

W. B. Thompson at Clifton, a director of the Shannon C. Co. properties, reports both mines and reduction works giving satisfactory results. The smelter is making twenty tons of blister copper daily. The concentrator is working satisfactorily and making a close saving on all except a new ore that has been found, which is a combination of sulphides and oxides. Superintendent Bennie is experimenting, and is now saving some of the oxides. This is said to be the first ore of this character found in Clifton district.

### Mohave County.

T. and J. Ewing of San Francisco, Cal., report work progressing on their Vivian group, near Needles, Cal. The number of men will be increased and development continued with intention of placing a stamp mill on the mine.

### Pinal County.

It is said the Ray mines at Kelvin will resume operations this month. The owners will sink an 800-foot shaft and drift to determine the extent of the body of copper sulphides which shows at the surface. It is intended to start the reduction plant. The narrow gauge railroad from the mines to the concentrator at the camp will be put in repair.—At the Wooley mine an 800-foot, timbered shaft is being sunk and is 50 feet below the 300-foot level, at which point a crosscut is being run. This is a copper proposition with gold values. Machine drills are being used.—The Copper Buttes mine, on the north side of the river, was shut down three or four weeks ago on account of high water in the Gila. No supplies could be obtained from the railroad, as the river was unfordable. Work will be resumed. The double-compartment shaft is down 500 feet and will be sunk 300 feet more and the ore bodies lying to the north tapped by crosscuts.

The Troy-Manhattan mines at Troy are reported showing up well. A body of wulfenite has been struck and a concentration mill is nearly completed to work this product. The ore is said to be worth \$200 a ton as it comes from the mine. The management is considering a tram and reduction works, to be built on the Gila river at the P. & E. Railway. This will give them shipping facilities and necessitate only 3 miles of tram.

A. C. Sieboth, superintendent of the Lake Superior & Arizona C. Co. mines, near Florence, says a carload of ore a week is being shipped to the Val Verde smelter. The ore is from the Anderson stope and average value is \$1500 per car. Three six-horse teams are hauling ore to Florence, and fuel oil on return trip. Sinking is progressing and shaft is down 260 feet.

Manager Gordon of the Ray M. Co., at Kelvin, expects to start a three-compartment shaft this month which he intends to sink 800 feet. Other development work is also to be done and the mine will be equipped.

### Santa Cruz County.

W. H. Barnett, manager for the Happy Jack M. Co., owning properties in the Santa Rita mountains, near Nogales, says development work will be started by driving a tunnel.

W. E. Johnson of Pittsburg, Pa., interested in the Gladstone M. Co. which owns the Proto mines near Nogales, reports increase in production will be made. T. T. Harding is superintendent. Ore is being shipped to the smelter.

### Yavapai County.

An explosion of molten slag on the 24th inst. caused the total destruction of the Val Verde smelter at Val Verde, 20 miles east of Prescott. The smelter employees were drawing slag from the furnace and were unable to get a plug in to stop it. When the molten mass ran onto the wet floor an explosion occurred. The red-hot slag and matte were scattered all through the building, causing fire to break out in

several places. The building and machinery were destroyed. The plant was of 300 tons capacity and cost between \$150,000 and \$200,000, with insurance of \$60,000. The plant was erected by the Val Verde four years ago and bought by the Bradshaw Mountain C. M. & S. Co. three months ago. The latter company was planning to double the capacity of the plant. It will be rebuilt. The Bradshaw Mountain Co. has mines at Crown King. G. W. Middleton is vice-president and manager.

In Hassayampa district, near Prescott, the Mount Union Con. M. Co., E. E. Greenwood manager, has bought the Franklin-Penobscot group, the Lynx group, Yankee Blade, Sure Thing and Winfred Gould claims for \$50,000. The Mount Union Con. M. Co. is a consolidation of the Arizona and Mount Union M. Companies. The company has forty men at work and will double the number. R. Green of Appleton, Wis., is president.

## CALIFORNIA.

### Inyo County.

A. A. Hassan of New York City and J. B. Sperry have taken over the Rocky Point, Comstock and twelve other claims in Bishop Park section, 17 miles southwest of Bishop. Development work will be started and ore will be taken out for testing method of treatment.

First payment has been made on the Kearsarge mines, near Independence, sold to Murray et al. of Detroit, Mich. T. Evans is manager.

### Kern County.

The Peerless Oil Co., operating in Kern river field, near Bakersfield, reports the delivery of 631,583 barrels of oil for the four months ending August 31. Wells No. 34 and No. 35 are in operation and No. 36 is being drilled.

### Nevada County.

Manager J. Underwood of the Omega mine at Washington has men at work building a dam in front of the one erected last year and will be of logs and stone. It will be 79 feet high by 138 feet long. A hoist is being put in at the mine.

The Phelps Hill M. Co., operating near Nevada City, has been reorganized and the following are directors: W. P. Ketchum, president; W. T. Farrar of San Francisco, D. E. Morgan, W. H. Martin, F. Seales, J. C. Campbell and C. R. Quackenbush. It is intended operations will be resumed this month.

After prospecting for four years, the Coe mine at Grass Valley is being closed. The pumps will be packed against rust, but a large part of the portable machinery will be removed, says O. C. Turner, owner of the Coe. The shaft has been sunk from the 700 level to 1150 feet, and 3000 feet of drifts have been run. The mine has a 20-stamp mill.

The Great Dane G. M. Co. has been incorporated to operate the Round Mountain Champion group near Nevada City. The officers and directors are: N. C. Larsen, president; F. C. Anderson, M. C. Morgensen, treasurer; E. K. Peterson, M. Holm, C. W. Hansen, G. Sillesen, B. Pearson, J. E. Markley, all of San Francisco. The property is under management of G. Kartschoke of Nevada City. He has a shaft down 125 feet and expects to sink 100 feet farther. He has a steam hoist and pump at work. The Round Mountain and other locations comprising the group owned by the Great Dane G. M. Co. are 2 miles from Nevada City on the North Bloomfield road.

Water was turned into the pipe line of the Mountaineer mine at Nevada City last week. The line is 4800 feet in length and 15 inches in diameter. It is connected with the pipe line of the Summit mine, making a total length of 2 miles, and has a 780-foot pressure, says Superintendent Campbell. Hoisting has resumed.

### Plumas County.

The Blue Grizzly M. & D. Co. has been incorporated by C. H. Workan, E. G. Davis, C. B. Thompson of San Francisco, A. E. Paddock and F. L. Butterfield of Quincy, F. Blanchard and N. B. Frisbie. The company's mines are east of Quincy, near Greenhorn creek.

### San Diego County.

(Special Correspondence).—The Cuyamaca Co., S. H. Lucas superintendent, is unwatering the Stonewall mine and expects to have the workings opened by November 1st. The shaft will be sunk 400 feet more, making total depth of 1040 feet. The pumps are raising 400 gallons of water per minute, the inflow being estimated at 50 gallons per minute. Ore from the dump is being milled.

### Cuyamaca, Sept. 28.

### Shasta County.

(Special Correspondence).—The Midas mine at Harrison gulch is improving and the management reports it is assured ore can be easily mined and keep the mill and cyaniding plant in steady operation for several years to come. The main shaft is

down for a new level to be started below the 600-foot, where there is over 1000 feet of drifting. In the face of the drift shoots of ore 7 feet in width are showing and have been cut through several hundred feet. Development is also progressing on the upper workings and on the Trinity county side ore is blocked out ready for stopping. The company proposes building, 7 miles away, an electrical plant, which will furnish power and lights and do away with burning of over \$1000 worth of wood each month. Ore treated at present amounts to about 1000 tons per month.

### Redding, Sept. 28.

I. O. Jilison, manager of the Gladstone mine, near French Gulch, owned by the Hazel G. M. Co., reports average output of \$23,000 per month being made. The Midas mine at Harrison gulch, owned by members of the same company, is producing from \$22,000 to \$27,000 per month.

### Sierra County.

J. S. Wallace has a bond on the Wisconsin drift mine, near Downieville, and has started development work. The Wisconsin is west of the Ruby mine and is owned by J. L. Slattery, L. Kollegan and J. Kelly of Forest. The Ruby road has been repaired. H. J. Gould of Forest is superintendent.

### Siskiyou County.

(Special Correspondence).—The Advance group of claims on the divide at head of China gulch, in Sawyer Bar country, is showing free gold. The ledge is 5 feet in width between walls of slate and porphyry. The native gold comes in small seams in the sugary portion of the quartz. It is stated a mill run of 540 pounds of the quartz gave a return of sixteen pounds in gold. Development is by a 60-foot crosscut tunnel, tapping ledge 50 feet below surface, with drifting and raise on the ledge. A crosscut tunnel is being driven in 250 feet below the upper workings and by Oct. 1 is expected to cut the ledge. This group of claims is under bond to A. C. Brokaw of Fort Jones, A. Coolidge and A. F. McClaine of Seattle, Wash.

### Sawyer's Bar, Sept. 26.

(Special Correspondence).—Down the Klamath river from Hornbrook, near the Wolverine group of claims and in the same formation as the Jilison and Matern mines, J. Derry owns a group of five claims. The ledge is wide and has been exposed by open cuts for 4000 feet in length. The dip of the ledge is mostly 45°, but in places flatter. There are four tunnels aggregating 800 feet, the lower one being in 125 feet, with a depth below the surface of 140 feet. A depth of 1500 feet can be gained by driving the lower tunnel in 4500 feet.

In Quartz valley, near the Shores mine, H. Denour and R. H. Burton of Greenville are developing a free milling proposition carrying, with depth, iron sulphides. Development is being done in an incline shaft and a tunnel on the ledge.

The Wolverine group of six claims is 4 miles from Hornbrook, with W. H. Jones, D. & B. Wolf and G. B. Rymal as owners. A millsite is included. The main ledge is 35 feet between walls in places, although this and the smaller ledges are looked upon as being blanket veins. The ore is free milling quartz, with iron sulphurets, much of it being a ribbon quartz specked with free gold. There are 2000 feet of development, including a 650-foot tunnel. Superintendent G. B. Rymal intends putting on a stamp mill.

### Hornbrook, Sept. 26.

(Special Correspondence).—T. S. Fuller of Los Angeles, as president of the Ricarro G. M. Co., has during the summer months been superintending development and placing of improvements on the Classic Hill mine at head of Indian creek, near the Oregon State line and 13 miles above Happy Camp. He put in a saw mill and cut out in three days 20,000 feet of lumber which was used in building a flume.

H. J. Wood, owner of the Portuguese hydraulic mine, above Happy Camp, has refused to lease and will begin the winter season's work himself. He will open up on lower part of the bench.

The Oregon G. M. & W. Co., on the lower Klamath river, is driving two bed-rock tunnels, cutting through black slate to reach bottom of channels, also cutting the rim in order to place sluice boxes 80 to 100 feet deeper than previously. D. I. Jackson is resident manager.

The Pacific M. Co. of Chicago, Ill., J. W. Martin manager, has completed 3 miles of flume, the lumber being sawed at the company's mill. There are two ditches running to the mine. Martin will put in pipe to bring water from Fort Goff creek. This mine can be worked seven months in the year. The last clean-up after one month's run yielded \$2000.

### Happy Camp, Sept. 26.

(Special Correspondence).—The Golden Eagle mine, on Indian creek, in Scott valley, was virtually abandoned two years

ago, and now it is a paying proposition by the use of a 3-stamp mill and plates. The characteristics of the ore are similar to the New York mine, farther up the creek. The ledge is 3 feet wide at 150 feet depth and drifting is going both ways. The ore is free milling. An air compressor and machine drills are in use. A. C. Brokaw of Fort Jones and A. F. McClaine of Seattle, Wash., are owners and D. J. Sullivan superintendent.

### Fort Jones, Sept. 27.

(Special Correspondence).—The Railroad M. & M. Co. of Denver, Colo., is developing on the Klamath river the former holdings of the Minetta B. M. Co. of 2133 acres, including Williams Point and adjacent territory between Williams Point and the Minetta B. property, fronting on the Klamath river, formerly known as the Seattle mine. Of this latter portion only two-thirds of an acre was ever worked, and it is said yielded \$15,000 gold. The ditch of the company is 7 miles in length, running to Thompson creek, and this will be extended 6 miles farther during the coming season to capacity of 2500 inches. The water is conveyed across the river through a 22-inch pipe, a span of 340 feet, suspended by two 24-inch cables. The R. M. & M. Co. began its first operations July 10 of the present year, and made a run of twenty-three days, cleaning up \$2000 of gold. During the workings a "blue" channel was exposed, 40 feet in width and 400 feet in length, and it extends 600 feet farther on. The banks are about 60 feet deep, 35 feet of topplings being of no value, the pay gravel being 25 feet in depth. The winter season will begin about November 15th and twenty men be employed. The 22-inch pipe line is to be extended 500 feet and new ball-bearing giants put into use. The entire grounds are lighted by electricity. Headquarters of the company are in Denver, Colo. C. Tucker is president. T. J. Nolt, at the mine, superintendent.

### Nolt, Sept. 27.

(Special Correspondence).—The Morrison-Carlock G. M. Co. has been incorporated and has taken over the Morrison mines in Quartz valley, near Fort Jones. The greatest depth attained is 350 feet, and from this level extends 800 feet of drifting in high-grade ore, 18 inches in thickness along the wall. Sinking below this level is going on, and at 60 feet another level will be established. In all, there are five levels and over 800 feet of drifting from each. In sight are said to be 7000 tons of high-grade, free-milling ore. The mill has been overhauled and ten stamps added, with a Frue vanner and a Pinder concentrating table. A 40 H. P. air compressor and drills have been added. A dynamo furnishes light for the mine and mill. A feature in the mill is the sand pump, which raises the tailings from the plates to a large vat above the concentrating tables. J. M. Morrison is superintendent and manager.

The New York mine, on Indian creek, is owned by the Monarch M. Co. of Tacoma, Wash. Since April, 1901, this company has been in possession, under management of J. B. Scott. Development has opened up a paying proposition. The formation is an altered diorite and the ore largely free-milling quartz. The depth of the main incline shaft is 600 feet. On the 500-foot level is over 500 feet of drifting. On the 400-foot and 500-foot levels considerable prospecting was required to find the main shoot of ore after two faults. Equipment of the mine consists of a 40 H. P. air compressor to run seven machine drills, a 40 H. P. boiler for rock breaker and hoist and a 30 H. P. motor for the ten stamps and concentrators in the mill. About thirty-five men are on the payroll.

### Fort Jones, Sept. 27.

(Special Correspondence).—The Mount Vernon G. M. Co. of Spokane, Wash., owns the group of claims on the divide between Cherry creek and Greenhorn gulch, near Yreka. The company was organized last January and has increased developments and added improvements. The 1000-foot tunnel on the Cherry creek side has been driven in 280 feet farther, which makes 1280 feet directly on the ledge, and ore is being stopped. Manager H. W. Lane is driving No. 3 and No. 4 tunnels on the Greenhorn gulch side and is in 200 feet on each, they being 100 feet apart. The top of the hill will be 400 feet above the breast of the lower tunnel. Raises will connect all workings. So far the ore has been in porphyry formation. As depth is gained a slate foot wall comes in with a 4-foot ledge, there being next to it talc carrying values of \$7 to the ton in gold. Improvements being added on the Greenhorn gulch side consist of a sawmill, now sawing lumber for buildings and timbers for the mine, and run by power from the Siskiyou electric light and power plant. This will also run the 5-stamp mill, concentrator, crusher, and furnish lights for mine, mill and camp, and also an electric fan to ventilate the mine. Water is

obtained from a spring and from the mine. A force of twenty men will be employed during the coming winter. The main office of the company is at Spokane, Wash. M. Jacobs is president, C. D. Francis secretary, H. W. Lane, at the mine, vice-president and manager. Yreka, Sept. 28.

J. E. McBride, principal owner in the Headwaters quartz mine, near Yreka, says he will start operations again. The mine has been equipped with a quartz mill, sawmill and other improvements. A tunnel has been driven to the Lucky Jack ledge, which is 4 feet wide. Pumps will be put in and they will sink on the ledge.

#### Trinity County.

Development work on the Enterprise mine at East Forks, near Weaverville, is going ahead and ore will be opened up as soon as connection is made between the upper and lower tunnels. The mill will be started up. It is intended to put in an electric lighting plant. At the Yellowstone group of mines adjoining, which are under same management, the ledge is showing values. These two groups are amply supplied with wood and water and are equipped with stamp mills.

### COLORADO.

#### Clear Creek County.

(Special Correspondence).—During a period of eleven months' work done by S. A. Knowles, contractor in the Central tunnel at Idaho Springs, for his own information and as a matter of general interest to the mining fraternity, he concluded to keep a daily report of the work done by two water Leyner drills which he used in doing the work and which were not specially prepared for the undertaking, being machines taken from regular stock. The record extended over a period of about twelve months, during which time 245 shifts were worked. During this time the number of holes drilled per month varied from 143 to 533, depending on number of shifts worked and the number of feet drilled per month, from 900 to 4096. The total number of holes drilled was 4424, and the total feet drilled, 34,244. The cost for repairs per shift was \$0.383. Rock drilled through was hornblende schist, hard and tough. During the period through which the record was kept the tunnel was advanced from 5 feet 10 inches per shift to 9 feet 5 inches, the total distance driven being 1830 feet. The average number of feet driven per shaft was 7 feet 5 inches, and the average time drilling was five hours and fifteen minutes. The drill crew consisted of a runner for each machine and one helper for the two machines. The drills operated but one shift daily throughout the entire period. The air pressure maintained was 110 to 130 pounds, the altitude being about 8000 feet. Idaho Springs, Sept. 26.

The Democrat Mountain M. & M. Co., near Georgetown, under Manager Burt, reports progress in development on the Jordan lode, on which they have a bond and lease. They have been cleaning out and retimbering the shaft, and have found a streak of ore assaying \$80. They propose putting in a plant of machinery and sinking the shaft to a greater depth. The property is on Democrat mountain.

The Ninety-Four company at Alice has completed repairs in the mill, including overhauling of the engine, and is treating ore which has accumulated in the bins. The bridge being built over Clear creek at Idaho Springs by the Colorado & Southern R. R. Co. will facilitate handling of ore to the Jackson mill and will assist in shipping the product from the Jackson, Hudson and other mills on the south side of Clear creek.

#### Dolores County.

The Rio Dolores M. Co. is operating a group of mines at Burns station, 2½ miles north of Rico. Manager J. W. Burns says he will increase the number of men at work. The Herman group of mines, in Mount Wilson district, 15 miles from Rico, is being worked by J. D. Adams, S. Bryant, C. W. Herman and G. Leavel.

#### Eagle County.

Near Red Cliff the owners of the Ben Butler mine, on Battle mountain, Nihisr & Co. of Hagerstown, Md., report having struck a body of ore, the shoot showing 18 inches in width. It carries values of \$100 per ton in gold.

#### El Paso County.

Creditors of the General Metals Co., operating the Telluride mill at Colorado City, have taken possession of the ores in the property and have shut down the mill, pending settlement. The Telluride mill was built three years ago and has a capacity of 300 tons a day. The shutdown throws 125 men out of work.

#### Gilpin County.

H. R. McClelland of Denver has started up the Oro mill on North Clear creek below Black Hawk, which was erected to handle the slimes and the gulch dirt of

North Clear creek. Improvements are being made and concentrating tables added.—Fouts et al. of Russell Gulch, who have a lease and bond on the Grizzly mine in Russell district, have bought the shaft equipment on the Pocahontas mine on Quartz hill and will install it on the Grizzly mine. They have unwatered the property, are retimbering the shaft and cleaning out the levels and arranging to deepen the shaft 100 feet.—J. Laughran of Central City has started up the Buckley and Wood mines on Quartz hill. Unwatering the 600-foot shaft on the Buckley mine is under way. Some timbering and dead work will be necessary before development work can be started. It is also intended to open up the Wood mine and the two will be worked in conjunction.

The Golden Rod M. Co., J. Lillig president and manager, is developing a group on Silver creek, 4 miles northwest of Central City. The main shaft has been sunk 200 feet. The vein is 3 feet in width, carrying a sulphide ore said to average \$40 per ton. A crosscut tunnel to intersect the shaft and develop other claims in the group has been started, its objective point being 1000 feet distant. Machinery equipment consists of a steam hoist, air compressor and one drill. The shaft will be deepened. There are ten lode claims, three placer locations and a millsite.

Owing to action of the water in rapidly destroying the metal pipes at the Old Town mine, at Russell Gulch, Manager Kimball is putting in pipe lined with wood. The new water pipe will be 1600 feet long. Ore is being shipped to the Golden smelter, to be treated when the furnace is blown in, the first of next week. The Jackson mill at Idaho Springs is being run exclusively on ore from the above property, while all ore which can not be handled there is being treated at the Crow mill.

#### Hinsdale County.

The Contention group of mines on Hotchkiss mountain, near Lake City, owned by a Boston company, has completed a 90-ton concentrating plant. The Contention property embraces eighty acres, and is developed by a long drift on the main vein, with its opening near the mill.—M. Corwin, with Eastern associates, has bought the Leonard group of mining claims on Handy peak, in Burrows Park mining district, and is putting up buildings, etc. A 400-foot crosscut tunnel will be driven.—The Hidden Treasure mine and mill is turning out 100 tons of ore per month.—At the Pride of America mine on Henson creek, 7 miles from Lake City, the ore shoot has been opened up, showing 5 feet thick of lead-copper ore. Two feet of the vein are lead carbonates of high grade, report lessees Gannon & Kranicfeldt.

J. M. Miner, manager of the Big Casino mine, which joins the Pride of America mine on the west, near Lake City, will resume development work. The Casino is showing a continuous ore streak down the 125-foot shaft. It is intended to send the shaft to 300 feet.—The Adelia M. Co. has been incorporated and has bought the Waldron group of claims at Mineral point. The property is being equipped with a hoist and surface improvements.—The Silver Star mine, at Burrows Park, has been bonded and leased by Stover & Cartwright of Galveston, Tex., who are putting the property in shape for production.

#### Lake County.

The South London tunnel, near Leadville, on the east slope of Mosquito range, has been completed to connection with the North London workings. Connection has been made through a raise of 300 feet, that being the distance between the levels of the North and South London workings. Thirty feet from the South London level, the upraise passed through a vein of ore. All the work in the South London is at present development and no ore is being shipped. Near mouth of the South London, the tunnel passed through a body of fair-grade mineral. This will be developed. A compressor is being operated at mouth of South London, which supplies air for the mine, and power for the drills. The tunnel is 2300 feet long. It is intended to continue development through this tunnel, before beginning to stope out the ore which has been opened in the South London.—The Castle View shaft on the Big Chief lease is shipping twenty tons of lead ore and the same amount of iron a day. The property is being operated by M. Nicholson.

The Leadville District Mining Association, which takes in every mine manager in the district, has decided to issue working cards for carrying on the fight against the Western Federation of Miners. Notices have been posted at every mine in the camp to the effect that no person will be employed who shall not have deposited with the timekeeper his card of recommendation from the mining association.

Every applicant will be required to sign a statement that he is not a member of the Federation, or of any order controlled thereby, and if he is a member of the Federation he will be required to renounce his allegiance to it. The mine owners are said to believe that the Federation is seeking to secure a foothold in Leadville, a large number of Cripple Creek miners having gone there since the trouble in that district. The operators claim the men, both union and non-union, have expressed a willingness to sign up as soon as the formal order was issued, and that out of the 3000 miners in the camp not more than 200 are now in good standing with the Western Federation of Miners. The object of the order, it is further asserted, is not so much directed at the union men now at work at Leadville as to prevent men going there from Cripple Creek and Telluride and obtaining employment.

#### La Plata County.

(Special Correspondence).—The May Day tunnel has cut the vein at a depth of 500 feet and drifting and raising have begun, while considerable shipping ore is coming out of the upper levels through the shaft. Two carloads of high-grade ore were shipped last week.—Forty men are grading and building at the Bonney Girl and the manager expects to have the mill ready for operation before snow begins.

The Chief M. Co. is at work on the excavation for its mill, and grading a road and a line for the tramway from mine to mill. They have completed a bridge across La Plata river which connects the mine with the State road.

The Boren Gulch M. Co., operating 2 miles above La Plata, has opened a 3-foot vein of galena near the crest of Babcock Peak. The galena carries considerable silver glance, as well as several dollars' in gold, and a carload is being taken out for shipment to Durango. The vein has been traced down the mountain and men are at work opening it 500 feet lower.—Rich float was recently found and traced to the Little Kate property, where two shifts are drifting for the vein.

La Plata, Sept. 25.

#### Montezuma County.

(Special Correspondence).—Little is being done on the Mancos side of the range this season except in the way of prospecting. Doyle's suit with Burns has tied up his property, at the head of the East Mancos, which has been the center of activity during the past three years. But several other prospects are developing into mines and considerable good ore is in sight.—On the Silver Falls group work has developed good milling ore, with small pockets of high grade in which there is considerable free gold—many specimens containing large grains and wire gold.

The Old Kentucky is equipped with track and cars and drifting is being pushed. The breast is in 225 feet and at that depth crosscutting has shown the vein to be 20 feet in width, all milling ore. Streaks 6 to 12 inches wide run as high as 384 ounces in silver and 25% lead, with about half an ounce of gold.—Drifting continues on the Pike and the ore improves in quality. A considerable flow of water has been struck, but it is easily disposed of.

Mancos, Sept. 25.

#### Ourray County.

(Special Correspondence).—The Ouray Con. M. Co. has started operations on its tunnel which will be about 5100 feet in length when completed. In making this distance they expect to crosscut eighteen known veins already developed by twenty tunnels amounting to nearly 2000 feet of work. The tunnel is now in 145 feet and working three shifts. All the work is done by hand. A compressor and drills and power plant will be installed. The tunnel is 5x8 feet. Ore is gold and copper. The tunnel is about ¼ mile from the town. The entrance is near the Uncompahgre river which flows through a portion of the property and is within 300 yards of the Denver & Rio Grande Railroad. H. Ziegenheim of St. Louis is president; J. H. Turnbach, secretary, and J. W. Jones, superintendent.

Ouray, Sept. 25.

(Special Correspondence).—Four miles from Ouray is the American-Nettie mine in Gold Belt district. This mine is operated by the American G. M. Co. A. Riegels is superintendent. The mine is 1800 feet higher than the town of Ouray. A 4100-foot aerial tramway connects the mine and mill. The mill is not running at present. Over 71,000 feet of drifting and tunnel work has been done on the property. The high-grade ore is shipped direct to the smelter. The company is doing development work.

Ouray, Sept. 25.

(Special Correspondence).—Over the hill from the American-Nettie mine is the Bachelor M. Co.'s property, 4½ miles from Ouray. G. R. Hurlburt is manager. The

company is doing but little work, but several leasers are operating.

Ash, Sept. 25.

(Special Correspondence).—Certain sections of this county are in fairly good condition and improving slowly. While there has been no labor difficulties to contend with, yet the depression has been very keen. In the Red Mountain district the building of the 40-stamp mill on the Bars-tow, the erection of a mill at the Treasury tunnel and the starting up of the Yankee Girl property has awakened activity there.

In the Sneffles district, near the town of Sneffles, the Altoona M. Co. is operating the Morning Star mine. The company owns twelve claims on Stony mountain. They are driving a tunnel to strike the Altoona vein. The tunnel is in 850 feet and is being driven with an electric drill. J. D. Spaulding is superintendent and J. A. Johnson, foreman.

A few yards above the Altoona is the Governor mine. This company has been doing development work the past four years and has two tunnels each 700 feet in length, besides raises and stopes. They have opened up good ore, a large percentage of which is mill ore. A 10-stamp mill is being built and will be ready to handle ore about November 1. They are also installing a compressor plant and power drills. A surface tramway is being put in from the mine to the mill. About 1000 tons of ore are blocked out ready for the mill.

The Revenue Co. is running about half its normal force in mine and mill.

The Camp Bird, Ltd., at Camp Bird, is running full force at the mine and the 70-stamp mill is kept busy. Each day one can see the guards taking the bullion to town for shipment to the mint which has been caught on the plates.

Ouray, Sept. 26.

#### Park County.

F. Clancy, manager of the Hayman M. & T. Co., operating at Tarryall, says he is putting in machinery for his company. A No. 7 Cameron pump is included. He reports shipping copper glance and other high-grade copper sulphides. They also carry values in gold and silver. These ores, the manager states, are sorted before shipping. It is claimed that at depth of 200 feet a dike 24 feet in width has been crosscut which averages 4% copper, with values in gold and silver.

Two miners were suffocated to death on the 26th ult., by a fire which destroyed the surface works at the Almaden tunnel, near Tarryall, reports L. C. King, superintendent of the mine.

#### San Juan County.

(Special Correspondence).—At Gladstone, 9 miles north of Silverton, is the 80-stamp mill of the Gold King M. Co., W. Z. Kinney manager. To the mill is being added a slimes plant, which will be ready for operation about Nov. 1st. The old mill contains stamps, plates and thirty-eight Frue vanners and has a capacity of 200 tons per day. The concentrates are transported in a bucket from the mill to the cars. A track on which this bucket travels runs the entire length of the mill. Many improvements are being made in the mill by Superintendent M. O'Rourke. New guides are being put in which will make each stamp independent and separate. The ore is now put through 30-mesh screens, but when the tailings plant is in operation the ore will pass through 15 or 16-mesh screens.

In the tailings plant they are putting four roller tube mills (for regrinding) and thirty-six Wilfley slime tables. This plant will double the capacity of the mill. The machinery will be driven by electricity. A power plant is being set up at the mill, containing a large steam turbine and other machinery. The slimes plant is 165 feet long by 74 feet wide. A plant for drying the concentrates is also being erected.

From the mine to the mill is an aerial tramway over which the ore is transported, also timbers and other material sent up to the mine. A fire put this tramway out of commission, temporarily, during the summer, but it is now in running order. A 12-drill Rand compressor furnishes air for the mine.

Gladstone, Sept. 25.

The Mines Securities Co. of New York is developing and equipping the Ruby Basin mine and the Natalie-Occidental properties, near Gladstone, with T. J. Hurley, manager. The Ruby Basin properties consist of seventeen claims with millsite and timber claims. The new mill is receiving its machinery and is expected to start operations this month. The mill is designed to handle fifty to seventy-five tons of ore daily, and will contain Blake crusher, coarse and fine Cornish rolls, Wilfley concentrating tables and slimmers and canvas tables. The mines are being developed through a crosscut tunnel and ore has been blocked out in raises and intermediate levels. Mine Superintendent

J. C. Durye says the mining of ore, together with all tramming and milling, will not exceed \$2.50 per ton.

#### San Miguel County

(Special Correspondence).—A portion of the Smuggler mine and mill is under lease to Lindsley & King. They have a lease on the Smuggler mill and will keep thirty stamps dropping. Wagner Bros. have a lease on the Pandora mill of the Smuggler-Union Co. and the Smuggler mine, and they expect to keep forty stamps dropping. The cyanide plant will be operated by the company under direction of W. L. Reid. About 100 men are working in the mine.

An average of sixty stamps are dropping in the 80-stamp mill of the Liberty Bell G. M. Co., handling 200 tons per twenty-four hours. The mill has a capacity of 300 tons per day. If the experiments now being carried on at the mill prove satisfactory a number of changes will be made in the equipment and process. The canvas plant is 420 feet in length and contains 156 canvas tables. Cyanide is also used. A. G. Kirby is mill superintendent.

The Nellie Co. is operating twenty stamps on ore from the Nellie mine. Telluride, Sept. 25.

(Special Correspondence).—On the Rio Grande Southern Railway, 1 mile from Ophir Loop, is the Butterfly Terrible mine, J. F. Keating, manager. The company has three tunnels. No. 1 is in 2500 feet; No. 2, in 600 feet; No. 3, in 2900 feet. Most of the work is being done on No. 3. They are starting to drive tunnel No. 4 from the mill which will cut the vein several hundred feet deep. An aerial tramway connects the upper workings with the 30-stamp mill. When tunnel No. 4 is completed the ore will be taken through that tunnel direct to the mill, doing away with the tramway. They work forty to forty-five men. The mill is operated night and day. It has not been decided whether the compressor used for driving the No. 3 tunnel will be brought down and used for the new tunnel or whether a larger compressor will be installed. Seventy-five per cent of the values are caught on the plates. Bullion shipments have averaged \$10,000 to \$12,000 per month and concentrates \$1000 to \$1500 per month net. No. 4 tunnel will be driven 3000 feet and will take approximately two years to complete the work. During the summer months the mill is operated by water power, and considerable of the time during the winter months. They have a steam plant also.

Thirty stamps of the 50-stamp mill are dropping steadily on ore from the Ida vein of the Ophir Con. M. Co. at Ophir Loop. Ore is brought from the mine to the mill over the 1850-foot aerial tramway. J. McWilliams is superintendent of the mine and L. G. Hamfeld superintendent of the mill.

Ophir Loop (Ames P. O.), Sept. 25.

(Special Correspondence).—J. Real et al. have a lease on the Caribou dump and are running same through the Suffolk mill, on which they have a lease. They are also doing custom work through the mill for lessees in the district.

Ophir, Sept. 25.

(Special Correspondence).—The Alta M. Co.'s mill and tramway (see page 224) are on Silver mountain, 10 miles south of Telluride. The company is operating twenty stamps, and is handling eighty tons of ore per day through the mill. The tramway is 4000 feet in length. Ten more stamps and necessary tables will be added to the mill. The work in the mine is done through tunnels, two of which are 1200 feet long and one 1800 feet long. When they start work on the lower tunnel they propose putting in an air compressor and power drills. All work in the mine is at present done by hand. With the exception of some surface water seeping into the mine, the mine is practically dry. The concentrates are packed to the railroad at Ophir Loop, 2½ miles distant. A. C. Koch is manager of the company. Seventy-five men are employed.

The Tomboy mine is operating with about 300 men. Guards are stationed on the property and no one is allowed to enter the premises without a permit from the manager. Any one coming from the Ouray side must have a permit before he is allowed to cross the Tomboy ground. If he can get through without crossing their ground they have no objections. The management probably figures it is more economical to keep guards than it is to have strikes and run the risk of having their buildings blown up.

Members of the Western Federation of Miners are not employed by most of the mines in the district. Good miners are coming in a few at a time, and the mines are gradually getting back to their normal output. On the whole, considering the strenuous times of a few months ago, matters are shaping themselves satisfactorily to the operators and business men of the district.

Four miles below Telluride, on the San Miguel river, are the workings of the Keystone Hydraulic M. Co. They are putting in 1500 feet of 48-inch riveted steel pipe. They have a fall of 500 feet. The flume that supplies the pipe line is 12 feet wide, 3 feet deep and about ¼ mile in length. The tailings flume is 3000 feet long, 5 feet wide and 4 feet deep, with 4½-inch grade in 12 feet. The flume is lined with 56-pound T rails, which act as riffles. Over 200 tons of rails were used in constructing the flume. They have considerable coarse rock that goes through the flume and the iron rails make the best riffles and wear longer. Air drills are used for drilling holes for blasting the larger rocks. During the summer they had plenty of water, but it is getting scarce now and they are running only five hours per day. Twenty-five men are employed. Hydraulic giants are used. Everything will be gotten ready this fall so they can start work in the spring without delay. R. W. Hill is manager and T. D. Harris, superintendent.

Telluride, Sept. 26.

E. L. Davis, manager of the Mayflower group, in Bridal Veil basin, near Telluride, has put on men and resumed work, after an idleness of six months.

#### Summit County

The American Gold Dredging Co. has its dredger steadily at work on the placer bars of Swan valley, near Breckenridge. The High Bar placers, owned by the company in Gold Run, are being worked with hydraulic giants, and long lines of sluices, and the Gold Run ditch which supplies water for their operation is running bankful. The water supply for the placer mines of Summit county has been good this season and a large output of placer gold has resulted.—The Reliance Gold Dredging Co. is increasing work at its plant in French gulch. A reservoir is nearly completed, and a steam churn drill is prospecting the ground to bedrock, to locate the channel.—The New Mekka G. M. Co. reports progress with its open cut and bedrock sluice, which will be 2000 feet in length when completed. The sluice is designed to strike the bottom of the hydraulic elevator, bedrock pit, which furnished ground that ran \$1 per cubic yard from the bedrock stratum, and affords an exit for the water and washed gravel of the pit.

Breckenridge reports say the Hamilton group and stamp mill in Summit gulch are being operated under a lease and bond by Huntington, Pike, Stouffer and Bernatchie. A streak of smelting ore has been opened up and a sample carload shipped to the sampler. The lead ores of the Swan river watershed carry values in silver and gold. Besides the gold bullion made at the Hamilton mill, auriferous concentrates have been produced.

#### Teller County

The Gradin G. M. Co. has been incorporated by E. L. Vill of New Rochelle, N. Y., G. F. Kerrin of Providence, R. I., and H. W. Barton of Greenwich, Conn., to operate at Cripple Creek.

The Stratton's Independence Co. is increasing work of building additional ore house capacity to accommodate the ore that the lessees are hoisting through four different shafts. The lessees are employing a total of 235 men on development, and raising ore. An increased tonnage will be made. It is averaging 100 tons per day at present.

Another producer has been added to the list of shippers in Cripple Creek district, the Four Brothers claim of the Cyrencoy Co., at the Beacon hill station of the Florence & Cripple Creek Railroad. Howard & Murbach, at a depth of 110 feet and south of the shaft, have opened a vein that shows sylvanite.—The Golden Cycle Co. is unwatering the shaft and lower workings and a greater tonnage of ore will be shipped.—The Tunnel M. & L. Co., operating the Abe Lincoln mine, on Gold hill, is handling eighty tons of the dump each day, washing it.—Lessees are operating the Arcadia mine, on Gold hill, and shipping ore.

The first consignment of ore shipped from Cripple Creek district, in which silver was the chief basis of valuation, was made last week from the Red Spruce mine on Gold hill, says the Times. The shipment contained fifty ounces of silver per ton and gold \$5 per ton. The ore is being broken in a vein that shows 12 inches across.

The Coriolanus Mines Co. has been incorporated, being a reorganization of the Coriolanus G. M. Co. R. S. Ellison and A. I. Ashe of Denver and K. T. Schuyler are incorporators, with J. P. Pomeroy, T. F. Poole, T. B. Burbridge and G. Fry as directors.

President C. C. Chapin of the Cripple Creek G. Exp. Co., says he will resume operations on the C. C. G. Exploration

tunnel. The breast of the tunnel penetrates Gold and Raven hills and has been driven for 6000 feet. Its destination is the Victor mine on Gold Cliffs, Cripple Creek.

The Strong mine, near Stratton's Independence mine, located on Battle mountain at Independence, is sending out 1500 tons of ore per month which returns satisfactory values. The ore is being broken in the seventh, eighth and ninth levels. Manager McDonald has started sinking the shaft another lift, which will give depth of 1025 feet.

Production at the W. P. H. mine of the United G. M. Co. is being increased and heavier hoisting machinery is being put in by Lessees Harrison & Seaver. The output from the W. P. H. has been a carload a day, having average value of \$1000 to \$1200 a car.

#### IDAHO.

##### Ada County.

The Boise Exp. & Dev. Co., Ltd., has been incorporated to operate Idaho mines, capital \$500,000 in \$1 shares; principal place of business, Boise; S. S. Horner, S. L. Tipton, H. S. Worthman, H. E. Neal, C. C. Anderson, J. H. Brown, J. N. Louder, J. Wright and W. R. Kinett.

##### Blaine County.

The mill on the Red Elephant group of mines at Hailey has been put in operation after several years of idleness.—A strike is reported in the Clipper mine, near Hailey. A vein of galena was struck in the lowest tunnel, 14 inches wide, of shipping value. The Clipper is opposite the Virginia group of the Alturas M. Co. J. and A. Richardson et al. are owners. They have 150 feet of backs.

##### Boise County.

The Checkmate mine, at Pearl, has been closed down by Manager E. H. Dewey, and the pumps pulled. The Lincoln mill has been receiving its water supply from the Checkmate.

The Mountainview mines in the Pine Grove district have been bought by Irvin and Lebar of Douglas, Wyo.

##### Elmore County.

At Mountain Home surveys have been made for a 3000-foot tunnel and a tramway route for the Monarch mines.

##### Idaho County.

The Belle of Thunder Mountain M. Co., at Sunnyside, near Roosevelt, is hauling machinery and other materials to its mines, says Assistant Manager P. W. Duffes.

##### Idaho County.

G. S. Losie, president of the McKinley G. M. Co., operating in the Salmon river district near Grangeville, says a 400-foot crosscut has been completed and also a drift of 200 feet on the lead. Mill tests show the ore to carry values of \$18 per ton. The company will build a 10-stamp mill.

P. R. Kelsey, manager of the Sacajawae Exploitation Co., operating placer mines on Newsome creek, near Newsome, says he will put in pipe and machinery to enlarge the plant. He reports a successful season, so that the company has decided to work three streams next season instead of one. A ditch brings the water 2½ miles. A new ditch is being built 2½ miles long. The company is controlled by Lewiston, Idaho, and Spokane, Wash., men. The ground is an old river channel which has been worked to a small extent for fifty years. The bank runs 220 feet deep and the pay gravel from 40 to 140 feet in depth. The company owns 360 acres of pay ground, the entire holdings covering 775 acres. Figuring only the active running time this season, Kelsey says they have taken out from \$240 to \$260 a day at a cost of \$23 a day. The pay gravel runs 8 to 30 cents a cubic yard, and with one stream they handle 1200 cubic yards a day. J. T. Graham of Lewiston is president.

President Smith of the Twentieth Century M. Co., operating Thunder Mountain properties near Roosevelt, says it has added sixteen claims to its holdings, making sixty in all. Of these, six are placer claims. Contracts were let for running three tunnels. The first tunnel will be driven 400 feet and gain depth of 250 feet. The foundation for the 10-stamp mill is completed, and it is expected the machinery will be put up this fall.

G. L. Hedges and G. S. Bailey, at Buffalo Hump, have started work on the Liberty Bell group, which has been idle for two months. Two shifts of men will continue the main tunnel, following the vein.—The Missouri-Idaho M. & M. Co. has been incorporated by G. L. Hedges, J. W. Blacker, T. Williams, A. Gordon and I. M. Bellett. The company owns four claims in the Four Mile district, near Hump, and will start development work next week.

The Portland & Idaho M. Co. has been incorporated at Portland, Or., to operate placers covering 1440 acres of deeded ground and 300 acres additional. It is intended to equip three dredgers that will

handle a total of 6000 yards of gravel a day. The officers of the company are C. A. Alisky, president; M. L. Pipes, A. E. Rocky, C. L. Hathaway and D. S. Cohen. C. A. Hathaway is manager. The property to be worked is on Secesh creek, near Warren.

##### Latah County.

At the White Cross mine, on Moscow mountain near Moscow, more men have been put to work. An air compressor and a cyanide plant will be put in. Assays of the tailings from the mill operated last season showed them to contain \$12 per ton, and the mill had only saved an average of \$8 per ton. Many tons of ore lie on the dump. The company has been driving a tunnel to tap the ledge 300 feet deeper. The mine is 9 miles east of Moscow.

##### Lemhi County.

Manager R. A. Hasbrouck of the Gold Dust M. Co., whose properties are at Leesbust, says the mill will begin turning out bullion. Superintendent Harker has development work on the vein showing \$10 ore blocked out. They will enlarge the plant to a daily capacity of 250 tons.

##### Shoshone County.

Wallace reports say the silver-lead mines of the Cœur d'Alenes during August produced 22,500 tons of concentrates and shipping ore, sent to the smelters. In the preceding month 20,500 tons were shipped. The largest output in history of the section was June, 1904, when 23,500 tons were forwarded. The average monthly output in 1901 was approximately 12,500 tons; in 1902, for the first eight months of the present year, 20,000 tons. The Bunker Hill & Sullivan mine, at Wardner, is making 4500 tons. The mines which approached this output were the Morning, at Mullan, and the Empire State, the Federal M. & S. Co.'s Wardner property. Each shipped about 3500 tons. The Standard and Mammoth mines together sent 4000 tons of concentrates to the smelters, a gain of 500 tons. The Hecla produced 1200 tons and the Hercules shipped approximately 1000 tons of ore. The output of the Tiger-Poorman was about 2000 tons.—The Snowstorm mine, at Mullan, the only copper producing property in the Cœur d'Alenes, consigned 1500 tons of ore to the smelters. The production for September will fall somewhat lower than for the previous month on account of the low stage of water. The Morning, the Standard and the Mammoth have been troubled considerably.

In the Pierce City district, near Greer, it is estimated 300 men are at work.—S. B. Miller, superintendent of the Red Cloud mine, has 25 men building a wagon road for moving of the Pioneer mill to the Red Cloud property.—Work on the Musselshell placers is expected to start this week with 125 men. The company will drive a tunnel 400 feet long to furnish an outlet for the tailings. The placer property, consisting of 1100 acres, is in the forest reserve 10 miles southeast of Pierce and before work can start it is necessary to secure permits from the Bureau of Forestry, Department of Interior.

#### MICHIGAN.

##### Houghton County.

The Calumet & Hecla at Calumet reports doing much new work this season. The remodeling of the second section of the Calumet mill is progressing. At the same mine a little rock is being supplied from the southernmost amygdaloid shafts on the Osceola lode, and two shafts are sinking on the Kearsarge lode, both showing well in copper. Two diamond drills are also working west of the Tamarack, to locate the Tomahawk lode, said to carry payable values.

#### MONTANA.

The report of the United States assay office in Helena for month of August shows increase of the gold production of Lewis & Clarke county, as compared with previous years. For August, 1903, the receipts for that county were \$23,000, while for the past month the receipts were \$61,298. The total receipts of the assay office for the month of August were \$263,235, as against \$257,945 for same month of 1903. The receipts from Montana for the month were \$239,326, as compared with \$212,138 for August, 1903.

##### Broadwater County.

A lease and bond has been closed to A. C. Mason on the Park, New Era, East Last Chance and other mining properties, near Hassell. Development work has been started, and an air compressor and drills are being put in. Plans are being made for a 100-ton concentrator.

##### Lewis and Clarke County.

The Jay Gould mine, near Helena, is employing 100 men, running the mill steadily with satisfactory results. The Montana company, owner of the Drum Lummon mine at Marysville, is developing the Silver Bell and Stuart in the Poor-

man district.—R. A. Bell, owner of the East Pacific, is operating his mine and shipping regularly.

The Whitlatch M. Co., controlled by Canol & Martin of Helena, are down 300 feet on the two-compartment working shaft on the Whitlatch-Union mine, 4 miles south of Helena. They intend to sink 425 feet, when crosscuts will be run.

#### Madison County.

A. C. Mason of Helena, president of the Black Hawk M. Co., will put in a stamp mill at the property of the company, near Pony. The mill will be operated by water power, with stamps, plates and concentrators. The main ore shoot is 75 feet long, smelter returns from which run \$21 per ton in gold and silver.

#### Park County.

The Cooke City smelter has been organized to do a mining and smelting business at Cooke City, with principal branch office at Seattle, Wash. The directors are H. Christensen, O. B. Olsen and O. Christensen of Cooke City, G. Allison, V. E. Bennett and T. Mason of Seattle, Wash.

The Conrad-Stanford company of Helena has resumed work on the Crevasse group, near the Bear Gulch mines, near Jardine. A mill will be put in operation.

#### Silver Bow County.

The Butte M. & Dev. Co., which has been operating the Emma mine at Butte under lease and bond, has closed down.

The Reins Copper Co., which owns the Combination mine in Meaderville, has struck a body of copper ore and is drifting. The vein was first cut at depth of 700 feet, the shaft passing through it. At 800 feet a crosscut was driven and the vein cut 7 feet wide. It is copper-silver ore.

### NEVADA.

#### Esmeralda County.

The Homestake group of seven claims, adjoining on the south the Silver Peak mine at Silver Peak, has been bought by the Mohawk-Alpine M. Co., which has temporarily suspended work on its Lone Mountain properties that it may give the more attention to its new holdings. The Homestake vein is reported 2 to 20 feet wide, between walls of granite and schist, averaging \$12 per ton in gold. The vein has been opened to a depth of 700 feet from the outcrop by two tunnels which are connected by raises and other workings from which ore has been mined and milled of average value of \$40 per ton. The ore is said to readily yield to treatment by amalgamation, concentration and cyanide at a total cost of \$6 per ton. President C. Y. Fuller of Utica, N. Y., says he will put in a 5-stamp mill. The property is 18 miles from the Tonopah Railroad and ample water for milling purposes has been secured.

#### Lincoln County.

The Venus M. Co. has been incorporated by I. D. Gresh, president; C. E. L. Gresh, E. Lyons, C. A. DeBerry and L. J. Kaiser at Searchlight. The company's mines are at Eldorado Canyon.

H. J. Cullen, owner of the Black Flag group of silver-lead claims, 43 miles west of Caliente, says he has crosscut a 4-foot vein of manganese ore.—Work will be started this week on a 24-foot body of gypsum on the St. Louis claim, 3 miles east of Caliente and 1/2 mile south of the San Pedro track. The property is owned by F. A. Foster and W. Lee.—A 28-foot body of gypsum has been sunk on by an incline shaft by J. Whalen on his Fourth of July mine, 4 miles north of Caliente.—A lease and bond for \$10,000 have been given to Blar & Seaforth of Reno, on the Gysy Queen group of eight gold-copper claims, 26 miles northwest of Moapa. Men will be put to work developing these claims next week.

#### Washoe County.

E. Olinghouse has struck 30 inches of \$40 gold-bearing quartz in the Butte mine at Olinghouse, near Wadsworth.—D. M. Henry and G. Nicholls have cut the lead from their crosscut tunnel on the Ora, showing 4 feet wide and \$20 per ton.—The Springfield Nevada Co. is taking out ore.

### NEW MEXICO.

#### Sierra County.

The placer camp of Shandon during August produced \$1000 in gold dust, reports C. Clark of Shandon.

### OREGON.

#### Baker County.

Manager Field of the United Elkhorn mine, near Baker City, reports a strike. The ore body was cut while drifting from the main working shaft. The shoot is 3 feet in width and a says \$60. The United Elkhorn is 16 miles northwest of Baker City. Work has begun on a double track tunnel, 3500 feet in length, to tap the veins at 3000 feet deep. The mines, drills and mill machinery will be lighted and run by electricity. Manager Field says that he will add twenty men.

#### Columbia County.

The Clifftown Coal Co., developing coal veins at Bunker Hill, several miles from St. Helens, is increasing work. The property is owned by J. Good, H. R. Cliff of St. Helens, C. E. Dalton of Chicago, Ill., and others.

#### Douglas County.

Bohemia reports say work is progressing on the Utopian group, on Elephant mountain. The group of five claims is owned by F. J. Hard of Portland. Several tunnels and open cuts have been run on the veins, showing bodies of ore. The main working tunnel is in 200 feet in milling ore.

The Jordan Creek M. & W. P. Co. of Portland, which owns a group of quartz and placer claims on Jordan creek, between Riddles and Canyonville, expects to begin development work this month. A Rowley, manager of the company, states that several tunnels have been run.

#### Grant County.

Work will be resumed on the Bull of the Woods group, adjacent to the Badger mine, near Susanville. The mines are owned by allied companies, with F. W. Bradley of San Francisco, Cal., manager. Last year a shaft was sunk to 250 feet on the Bull of the Woods and drifts run from two levels. Treatment of ore will be at the Badger plant, to which end, it is said, more stamps will be installed. The Bull of the Woods shaft is sufficiently near the Badger mill to connect economically by means of an aerial tram. A compressor plant is also being put in to be operated by water power. From this, compressed air will be piped to the Badger or Bull of the Woods, as required.

A. P. Jones et al., owners of the Magnolia group of eight claims, near Granite, are shipping ore to the smelter. The property is equipped with a 10-stamp mill and the main drift is in 900 feet. The Buffalo, a near-by property, which has been idle for several years, has been opened again and is producing high-grade ore. That group is owned by Pendleton people.

#### Jackson County.

(Special Correspondence).—The Braden mine, near Gold Hill, is being worked by G. Patrick and J. B. McGee, lessees. Tunnels on this property have been run to extent of 1400 feet. In the main tunnel a shaft is being sunk to 300 feet. The ore at 100 feet in depth is free milling, with high-grade sulphurets. The ledge is from 1 to 4 feet wide. On the property is a 10-stamp mill, with a Wilfey concentrator plant.

The Little Alice mine, 5 miles from Gold Hill, is in slate and developed by four tunnels, the longest 200 feet in, tapping the ledge 150 feet below the surface. The others are connected with raises and bodies of ore blocked out. On the property is a 2-stamp mill and cyanide plant. Gold Hill, Sept. 27.

(Special Correspondence).—The Opp mining group, near Jacksonville, has been under development for several years. The general formation in this locality is porphyry, diorite and slate, with ledges 3 to 10 feet in width and the ore free milling, with about \$7 per ton values. The longest tunnel is in 200 feet with a 200-foot raise to the surface. There are 300 feet of drifting. In the strongest ledge the pay shoot is over 5 feet wide. During development of the mine it has produced \$100,000 from its oxidized ores. J. H. Reddy of Spokane, Wash., is associated with J. W. Opp in management and development, and the 3-stamp mill is being replaced by a new building containing ten 1000-pound stamps, with space to add ten more.

Jacksonville, Sept. 27.

(Special Correspondence).—W. H. Jackson and I. L. Hamilton of Medford are developing at 30 miles from Medford a quarter section of land bought from the railroad grant and report opening up of cinnabar values. The breast of the 140-foot tunnel is 100 feet below the surface and in vein matter 10 feet in width. Development will be carried on during the winter months.

Milwaukee, Wis., men are negotiating with J. J. Honck of Gold Hill for his holdings consisting of a 2-stamp mill and the water of the river to the extent of 8000 H. P., and a ditch of 2000 feet and other appurtenances. The company is to build an electric plant to supply power and lights to mining and other properties and to the towns from Ashland to Grants Pass, a distance of nearly 50 miles. H. Schaeffer is manager.

Medford, Sept. 27.

(Special Correspondence).—Operations are progressing on the Shorty Hope mine, near Ashland. In the 2000 feet of tunnel work eight ore shoots have been cut, the ledges being 3 to 8 feet in width and the ore 50% free milling, the balance high-grade sulphurets. They will sink a 500-foot shaft in the main tunnel, which point will admit of drifting and stoping ore 700

feet below the surface. On the property is a 10-stamp mill with two Frue vanners. While the property is equipped with 500 H. P. of water, it is proposed to contract with one of the Gold Hill electrical power plants to furnish power for using electrical drills and lighting.

Ashland, Sept. 28.

(Special Correspondence).—Two miles from Gold Hill, E. T. Staples and C. E. McChesney are developing their holdings by a tunnel to crosscut the ledge. There are four ledges within 480 feet which are expected to unite. After striking the ledge a raise will be cut to the surface.

One of the well developed properties in the district is the Lucky Bart on Sardine creek, 6 miles from Gold Hill. The ledge is 40 feet in width, between diorite and serpentine, with payable ore, free milling, with 4% sulphurets. Development consists of 550 feet of work in the three tunnels and over 3000 feet of drifting at 170 feet below the surface. The ore from the Rita ledge averages \$15 in gold to the ton. Shipments have been made to the Tacoma smelter. On the property is a 5-stamp mill and a Johnson concentrator. The mill is run by steam. J. H. Beeman is owner.

Gold Hill, Sept. 27.

J. A. Whitman et al. of Medford have incorporated a company to develop and operate 2000 acres of placer ground in Jackson county. They are equipping the property.

#### Josephine County.

(Special Correspondence).—The Seeley mine on Murphy creek, 9 miles from Grants Pass, is being worked by C. Clark of Kirbyville and A. Fetsch of Grants Pass. There are two tunnels, one following in on a 12-foot ledge of free-milling quartz of \$12 value per ton in gold. Other development consists of several shafts down 30 to 40 feet. Development will be increased.

The Old Dick mine of three claims on Jump-Off-Joe creek is being developed by S. W. Richards of Port Townsend, Wash. The 2000-foot tunnel is at its face 150 feet below the surface on a 4-foot ledge of free-milling quartz of the value of \$12 per ton in gold.

Grants Pass, Sept. 28.

#### Lane County.

(Special Correspondence).—The Gold Zone M. Co., with headquarters at Corvallis, Or., is prospecting and opening up a group of claims in the North mining district, Cascade range. This mineral district, while having been known since 1859, has been but little prospected. Values are found in quartz ledges assaying from \$4 to \$40 in gold. The developments are principally surface prospecting, with a 100-foot tunnel. The officials of the Gold Zone M. Co. are: E. J. Dunn, president; B. J. Thatcher, secretary, and H. Hopkins, manager.

Eugene, Sept. 27.

#### Malheur County.

In Mormon Basin the Morning Star group, owned by W. S. Newbury of Sumpter, has finished milling tests and Newbury says a 10-stamp mill will be added. Four ledges, all carrying milling ore, have been opened up. Three are being drifted on. These ledges parallel each other. The ore carries gold.

### SOUTH DAKOTA.

#### Lawrence County.

The Gilt Edge-Maid M. Co.'s mill, 2 miles from Galena, will make its initial run this month. The machinery is being set up. Reduction of the ore will be by grinding process, Chilean mills being used, the ore being amenable to cyanide process after coarse grinding. The motive power will be electricity.

### TEXAS.

The aggregate length of all pipe line systems in southeast Texas fields (principally Jefferson and Hardin counties) for transportation of oil is said to be 444 1/2 miles, divided among the principal companies as follows: J. M. Guffey Petroleum Co., total of 110 miles; The Texas Co., 113 miles; Security O. Co., 107 miles; United O. & R. Co., 58 miles; Sun Co., 38 1/2 miles; National O. & P. L. Co., 18 miles.

### UTAH.

#### Beaver County.

Milford reports say work of putting up the stamp mill of the Estella M. Co. is progressing and the plant will be ready for operation next week. Stamps to crush forty tons of ore daily will be provided. The Estella is under management of S. A. Tarbet.

#### Summit County.

At Park City the mill at the Comstock mine has been started up again and is turning out concentrates assaying \$35 per ton. The management is hoisting all ore by hand, but a steam hoist is being placed.

#### Tooele County.

The Stockton G. M. & M. Co. at Stockton has bought the plant of the West Argent and its removal to the company's ground has begun. The plant will have a capacity of seventy-five tons of ore per day. A 4-inch pipe line has been completed from Soldier canyon to the mine, a distance of 4 1/2 miles, and an abundance of water is available with which to run the mill, says Manager J. J. Trenam.

#### Uinta County.

H. Sanger, in charge of operations at the Uinta Copper Summit Co., north of Vernal, reports blowing in of the smelter.

### WASHINGTON.

#### Ferry County.

J. L. Harper has bought for the Belcher M. Co. 260 acres and also located 40 acres of land at West Fork, 16 miles south of Republic, and has secured water rights on west fork and main stream of the San Poll river. He says that men will be put to work breaking ground for erection of a smelter, the initial part of which will consist of a copper matting blast furnace and a lead stack. A road will be built between West Fork and Park City by Ferry county and by the mine owners who are interested. The Belcher mine at Belcher camp, at Republic, is reported showing improvement, and ore has been put on the dump which runs \$60 a ton, mostly in gold.

#### Okanogan County.

Near Chesaw, at the Buckeye mine, buildings are going up and more men are being put on. Seven hundred feet of flume have been built leading to the mill-site, and the mill is expected to be in operation before snow begins. Ore will be taken from the mine at a point where the ledge breaks off in a vertical bluff, 30 feet high, and will be hauled half a mile to the mill. The ore is free milling and the mill will be ten stamps, with plates and tables. Power will be steam. The Buckeye is owned by Ohio men, with H. Thompson and M. A. Smalley of Chesaw, the former being manager.

### WYOMING.

#### Carbon County.

The main Congo vein has been cut in the Congo mine, 2 miles north of Dillon. The tunnel is in 200 feet, opening a large area of stoping ground below the old workings. The ore carries copper, gold and silver. The vein was crosscut in the old workings for 40 feet without striking the hanging wall. The property is owned by Dillon and Rawlins men, including I. C. Miller, C. R. Ferris, E. W. Hanchena and C. L. Flamme.

#### Laramie County.

The mill of the Hecla C. & G. M. Co. at Hecla, 20 miles west of Cheyenne, is closed down temporarily pending increase of equipment. The process being installed is intended to save a number of by-products that have been heretofore wasted by the mill.

### FOREIGN.

#### AUSTRALIA.

##### New South Wales.

At its half-yearly meeting, Aug. 26, the Broken Hill Proprietary Co. at Broken Hill reported explorations in the lower levels have increased. The 1000-foot level is opened 640 feet, showing sulphide ore, while the 800-foot level is opened between Delprat shaft and Broken Hill Proprietary block 10 company's boundary, showing similar ore bodies for 1300 feet. From the 500-foot level to 650-foot level a small portion of the lode has been worked, while from the 650-foot to 1000-foot level none extracted. The 800-foot level is opened for 2200 feet, while the total length from south to the northern boundary of the property is 3900 feet. Direct expenditure on account of development, £23,000. All haulage is carried on by Delprat shaft, which has depth of 1020 feet. The salt-cake process plant requires a few adjustments to complete. This plant is a series of small tubs to hold one cubic yard of material, yet has capacity for treating ninety tons in twenty-four hours, recovering 90% zinc. Limitation of zinc concentrates output at Broken Hill is under consideration with other companies.

#### Victoria.

Another gold sluicing dredge has been placed on the leases held by the Wattle Gully Sluicing Co. at Chewton.

### BRITISH COLUMBIA.

#### Boundary District.

Four mining transactions, involving in the aggregate \$200,000, are reported put through at Greenwood last week. D. McIntosh and North Dakota men have bonded the E. P. U. mines. The Montreal & Boston M. & S. Co. has secured the Lancashire Lass mine, in Summit camp, and the Sudbury group at Deadwood. S. Curtis of Rossland and others

have taken a working bond on the Strathmore mine, while three Greenwood miners have bonded the Combination, in Providence camp.—The Lake and the Last Chance claims, east of Greenwood, have been bonded to W. A. Harkins et al. of Grand Forks.—The Bonnie Belle mine, west of Greenwood, has been bonded to F. L. Johnson et al. of Chicago, Ill.

Greenwood reports say E. H. Thurston, owner of the Carmi mine at Carmi, on west fork of Kettle river, has put up a stamp mill and concentrator at his mine. The plant is under superintendence of R. C. Longley.

East Kootenay District.

At Windemere, the Paradise mine continues working a large number of men, and several teams are hauling ore to the river landing. H. C. Hammond is manager of the mine. It is understood they have a 4-mile tram from the mine to Pinehurst and a concentrator under consideration, to be built this fall.—P. Farnham, manager of the Ptarmigan mines, is expected to operate the mines again this winter.—Six properties are working. The Delphine, leased by Stoddard & Beatty, is shipping eighty tons of high-grade ore. P. Mickelson is working the Tilbury (B. C.) mine. Forty tons of ore are on the way to the smelter. The Pretty Girl, the Tecumseh, the Charlemont and the Bunyan are shipping. Other properties are doing development work.

West Kootenay District.

From the Old Gold mine on the Duncan road, near Ferguson, owned by the Consolidated M. & S. Co., ore is being shipped by pack train to smelter. More men will be put on.

Yale District.

The Trethewey & Beatty lease from the Canadian Government of 15 miles of the Fraser river has been sold to I. B. Hammond of Portland, Or., and H. B. Plummer of Dallas, Or., who will build a dredger and work the ground. Plummer has a prospecting drill at work. The lease covers the river bed and bars between banks from a point 1 mile from Yale to within 1 mile of Hope, on the Canadian Pacific Railroad. The lower end of the ground is 80 miles above Vancouver. There are bars in the main stream of from 300 to 800 acres in extent. Pits sunk for prospecting purposes have shown the bedrock to be at an average depth of about 37 feet. Dominion Government reports estimate the average values of the dirt at 30 cents per yard. The Government lease requires work of \$50 per mile per year. Hammond & Plummer will put in an endless chain dredger of 1500 to 2000 yards daily capacity. By a provision of Canadian law there is no duty charged on mining machinery built in the United States brought in for operation of Canadian mines.

JAPAN.

Gold-bearing deposits have been found at Iwato and examinations made by Government engineers. The Finance Department will conduct mining operations on the fields for the Government, as the deposits have been reserved from private location.

MEXICO.

Chihuahua.

R. J. Coleman and H. E. Cary of Salt Lake City, Utah, are increasing development of the Lluvia de Oro (shower of gold) mines in western Chihuahua, near Choix, Sinaloa, and are putting in a 20-stamp mill. On account of the rainy season, there has been delay in securing timbers for the mill.

G. Gillett of Parral, with W. J. Parker et al. of New York, has organized a company to take over and operate the Quebradillas, Grenadena and the Iguana mines in Parral district.—W. P. Guthridge et al. of San Francisco, Cal., are developing a group of gold properties northwest of Guadalupe y Calvo.

Durango.

At the Luster M. Co. mines at El Oro, 60 miles south from Rosario, terminus of the Parral branch of the Mexican Central, the 150-ton smelter has been blown in. Two gas engines of 200 H. P. were put in to work the blowers. The Luster company's mines are of copper and gold. They will make a copper matte, the principal value of which will be in gold. W. E. Kock is manager of the Luster company.

Sonora.

At Klondyke camp, beyond the Santo Domingo river, east of Magdalena, the Loraine G. M. Co., having completed repairs on its mill and machinery, has resumed production of bullion. The mine has considerable water, and in controlling it the pumps raise 500 gallons per minute. La Libertad, an antigua mine in Prietas canyon, near San Antonio de la Huerta, has been bought by a company of Chi-

cago, Ill., men, including R. C. Coy and brother. A 60 H. P. pumping engine is in operation unwatering the mine. H. L. Miller is superintendent and J. Cleaver foreman.

NICARAGUA.

The Nicaragua G. M. & M. Co., operating at Gracias a Dios, has its 20-stamp mill in full operation. Manager G. W. Maybee says he will cyanide the tailings and will also put in an electric lighting plant.

Commercial Paragraphs.

THE Denver, Colo., office of the Denver Ore Testing & Sampling Co. has been changed from 17 Jacobson Building to 527 Seventeenth street.

BOOKLET NO. 41, from the Northern Electrical Manufacturing Co., Madison, Wis., graphically portrays their exhibit in Section 14, Palace of Electricity, Louisiana Purchase Exposition.

THOMAS STEWART CHALMERS AND NORMAN WILLIAMS, JR., have organized under the firm name of Chalmers & Williams, with offices in the Railway Exchange, Chicago. They will deal in supplies for mines, mills and smelters. Mr. Chalmers is a son of W. J. Chalmers, who has long been identified with the mining machinery business. Mr. Williams is a son of Norman Williams, who is identified with the Pullman Co. and the Western Electric Co. The personality and training of the sons of these well known men should warrant the belief that the new firm will be a success.

JAMES S. BROWNELL, western manager Frue Vanning Machine Co., 132 Market street, San Francisco, Cal., reports the following sales since July 1, 1904: Sixteen 6-foot Frue vanners to the Kennedy mine, Jackson, Cal., completing an equipment of forty of this style of machines for the new mill of 100 stamps; eight 6-foot Frue vanners to the South Eureka mine, Sutter Creek, Cal.; four 6-foot Frue vanners to the Central Eureka mine, Sutter Creek, Cal.; two 6-foot Frue vanners to the Keystone mine, Amador City, Cal.; four 4-foot Frue vanners to the Hurrah Quartz mine, Nome, Alaska; three 4-foot Frue vanners to the Gold Dike M. & M. Co., Summerville, on Salmon river, Siskiyou county, Cal.; one 4-foot Frue vanner to C. Richter, Fresno, Cal. All of the above machines furnished with the Brownell patent lip flange belts. "In addition to the above sales of Frue vanners we have shipped twenty-nine 6-foot and thirty-two 4-foot Brownell patent lip flange belts for supplies, shipments being made to Chinnampo, Korea; Douglas Island, Alaska; Eagle-Shawmut mine, Chinese, Cal.; Oneida mine, Jackson, and numerous other well-known mines on the Pacific coast."

Obituary.

I. H. SEVIER of Eureka, Cal., assayer and cyanide operator for the King of Arizona mines at Kofa, Yuma county, Ariz., died at Kofa on Sept. 26.

L. C. SNYDER, a Colorado pioneer miner, died at Denver, Colo., Sept. 19. Deceased went to Colorado forty-five years ago, settling at Black Hawk, where he engaged in mining. He served twice as county commissioner of Gilpin county and was several times mayor of Black Hawk.

NORMAN MCGEE of Denver, Colo., died at Colorado Springs, Colo., September 28. Deceased was thirty years old. He was appointed to the chair of engineering at Colorado College, but had to resign after acceptance. He was professor of civil engineering several years at the Imperial University in Tientsin, China, and at one time was division engineer of the Southern Pacific. He was a graduate of Stanford University, 1898.

Books Received.

Under the head of Mineral Resources for 1903, the United States Geological Survey has issued: "Production of Abrasive Materials;" "Production of Gypsum;" "Production of Flint and Feldspar."

Under the head of Mineral Resources of the United States for 1903, the United States Geological Survey has issued: "Production of Graphite;" "Production of Borax;" "Production of Antimony;" "Production of Arsenic;" "Production of Glass Sand;" "Production of Lead."

Personal.

R. C. LONGLEY is superintendent of the Carmi mine and mill at Carmi, B. C.

E. K. COPE is chief chemist at the mines of the Oliver M. Co. at Eveleth, Minn.

H. E. WOODS has returned to Denver, Colo., from Grants Pass, Or., via San Francisco.

J. W. BURNS is manager of the Rio Dolores M. Co. at Burns Station, north of Rico, Colo.

E. C. TRETHEWAY of Nelson, B. C., is superintendent of the Mollie Gibson mine, near Nelson.

S. W. TRAYLOR, of the Traylor Engineering Works of New York City, is in Denver, Colo.

J. H. MCGILL is president and manager of the New York Bonanza M. Co. of Salt Lake City, Utah.

H. J. GOULD of Forest City, Cal., is superintendent of the Wisconsin drift mine in Sierra county, Cal.

R. O. JONES, chief engineer Jeanesville Iron Works Co., Hazleton, Pa., is visiting San Francisco, Cal.

T. MORGAN is superintendent of the New York copper mines at Park City, Utah, vice D. Ferguson, resigned.

C. F. DE PUY is manager of the Old Roman M. Co. operating at Newberry mountain, near Searchlight, Nev.

E. M. CLARK, owner of the Chicago mine at Groom Creek, Ariz., is in New Haven, Conn., on mining business.

D. FERGUSON has resigned as superintendent of the New York mines at Park City, Utah, and will go to Nevada.

J. CRONIN of Spokane, Wash., is conducting cyaniding tests on the C. R. M. & M. Co. mine at Oro Grande, Idaho.

G. KARTSCHKE of Nevada City, Cal., is manager of the mines of the Great Dane G. M. Co. near Nevada City, Cal.

E. E. GREENWOOD is manager of the Mount Union Con M. Co., operating in Hassayampa district, near Prescott, Ariz.

D. KAUL has been appointed a mining engineer on the staff of the Cerro de Pasco C. M. Co. at Cerro de Pasco, Peru.

S. J. SPEAK of London, England, is resident manager of the Ymir G. M., Ltd., at Ymir, B. C., vice G. H. Barnhart, resigned.

F. KLEPETKO of New York City, N. Y., is consulting engineer for the Hermina M. Co., operating near Sudbury, Ontario, Canada.

B. M. CORNISH, manager of the Pioche-Nevada M. Co., operating mines at Pioche, Nev., is in London, England, on company business.

G. H. BARNHART has resigned as manager of the Ymir G. M., Ltd., at Ymir, B. C., to operate the Porto Rico mine and mill at Nelson, B. C.

SUPERINTENDENT HARKER of the Gold Dust M. Co. at Leesburg, Lemhi county, Idaho, has returned there from Salt Lake City, Utah.

W. P. MCPHERSON is superintendent of the Gold Giant M. Co., whose mines are at Silver creek, near Acme, southwest of Kingman, Ariz.

T. D. MERTON, principal owner of the Spottiswoode R. & M. Works at Melbourne, Victoria, Australia, is inspecting reduction works in British Columbia.

CHAS. GUNN, of the Union Iron Works of San Francisco, goes East next week, and on his return takes charge at the Columbian Engineering Works, Portland, Or.

LINDSAY DUNCAN has resigned as professor of civil engineering in the University of Colorado at Boulder, Colo., to engage in engineering work, with offices in Denver, Colo.

H. L. MILLER, formerly superintendent of the Mina Grande mine in Sonora, Mexico, is superintendent of La Libertad mine, near San Antonio de la Huerta, Sonora, Mexico.

MANAGER G. D. B. TURNER of the South Quincy M. Co. of Park City, Utah, who has been to Europe for several months in the interest of his company, returned last week.

W. P. GUTHRIDGE, manager of the Cherokee Proprietary mines, will have management of the mines near Parral, Chihuahua, Mexico, of the Premier Exp. & Dev. Co. of London, England.

G. CLARKE, superintendent of the

graphite mines of the United States Graphite Co. at La Lapid, southeast from Torree, Sonora, Mexico, returned there last week from San Francisco, Cal.

H. SANGER, recently managing gold properties in Siskiyou county, Cal., is again manager of the Uintah Copper Summit Co. mines and smelter near Vernal, Utah, with which he was formerly connected.

L. J. HARTZELL, recently chief assayer at the Washoe copper smelters at Anaconda, Mont., has resigned to take professorship of analytical chemistry at the State School of Mines, Butte, Mont.

R. HEATH, who has been superintendent of the Lower Mammoth mine at Mammoth, Utah, for several years, has gone to the De Lamar mine at De Lamar, Nev., where he will have charge of underground work.

N. J. MARTIN has resigned as general superintendent of the mines of the North American C. Co., near Encampment, Wyo., and will go to Copiapo, Chile, as constructing engineer for the Sociedad Industrial de Atacama. He is succeeded at Encampment, Wyo., by S. S. Raymond.

Latest Market Reports.

SAN FRANCISCO, September 30, 1904.

METALS.

SILVER.—Per oz., Troy: London, 26½d (standard ounce, 925 fine); New York, bar silver, 58c, refined (1000 fine); San Francisco, 58c; Mexican dollars, 47c San Francisco, 45½c New York.

COPPER.—New York: Standard, \$12.75; Lake, 1 to 3 casks, \$13.00; Electrolytic, 1 to 3 casks, \$12.75; Casting, 1 to 3 casks, \$12.50; San Francisco: \$15.00. Mill copper plates, \$17.00; bars, 18¢@24c. London: £58 7s 6d spot per ton.

LEAD.—New York, \$4.30; Salt Lake City, \$3.50; St. Louis, \$4.12½; San Francisco, \$4.50, carload lots, 4½c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½c; pig, \$4.85. London: £11 7s 6d long ton.

SPELTER.—New York, \$5.20; St. Louis, \$5.00; London, £22 5s 3d ton; San Francisco, ton lots, 6½c; 100-lb. lots, 7c.

TIN.—New York, pig, \$27.85@28.12½; San Francisco, ton lots, 29c; 500 lbs., 29½c; 200 lbs., 30c; less, 31c; bar tin, \$32½@35c. London, £127 15s spot.

PLATINUM.—San Francisco, crude, \$18.50 ½ oz.; New York, ingot, \$19.00 ½ Troy oz. Platinum ware, 75¢@82c ½ gram.

QUICKSILVER.—New York, \$42.00@44.00, large lots; London, £7 15s San Francisco, local, \$41.50@42.50 ½ flask of 75 lbs.; Denver, \$45.00. Export, \$41.50@42.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 31½c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 18½c; San Francisco, Plumbers', 100-lb. lots, 16c.

ZINC.—Metallic, chemically pure, ½ lb., 50c; dust, ½ lb., 10c; sulphate, ½ lb., .04c.

NICKEL.—New York, 40¢@47c ½ lb.; ton lots, 40¢@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 31¢@34c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$12.75 @12.85; gray forge, \$12.00; San Francisco, bar, 3c ½ lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$23.00@23.00; open hearth billets, \$23.00 @23.00; San Francisco, bar, 7c to 12c ½ lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6½c; less than 500 lbs., per lb., 7c; in 25-lb. tin pails, ½ c ½ lb. above keg price; in 1 and 5-lb tin cans, 100 lbs. per case, ½ c. per lb. above keg price. Dry Lead.—In bbls., 1 ton and over, 6½c; do. in kegs, 7c.

LUMBER.—(Retail): Pine, ordinary sizes, \$24.00@25.00; extra sizes higher; redwood, \$28.00@30.00; lath, 4 feet, \$4.50 @5.00; pickets, \$21.00; shingles, \$2.50 for No. 1 and \$2.25 for No. 2; shakes, \$13.50 for split and \$15.00 for sawed; rustic, \$28.00 @35.00.

LIME.—Santa Cruz, \$1.25 country, \$1.25 city bbl.

CEMENT.—Imported, \$2.15@2.65 ½ bbl.; California carload lots, \$2.10 f. o. b. at works; small lots, \$2.40 ½ bbl. in sacks, 4 sacks to bbl., 10c for each sack returned.

GENERAL SUPPLIES.

ANTIMONY.—New York, Cookson's, 7½c; Hallett's, 6½c; San Francisco, 1000-lb. lots, 8c; 300@500-lbs., 8½c; 100-lb. lots, 10½c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1\*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1\*\* 50%, carload lots, 11½c; less

than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2\*\* 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2.00 per keg.

CAPS.—3x, \$5.50@6 per 1000; 4x, \$6.50@7; 5x, \$8@8.50; Lion, \$9@9.50, in lots not less than 1000.

FUSE.—Triple tape, \$4.00 per 1000 feet; double tape, \$3.50; single tape, \$3.10; Hemp, \$2.75; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 1½¢ set; 14 oz., 40s., 10c.

COAL.—San Francisco, coast, yard prices: Wellington, \$8.00; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallend, \$7.50; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8.00; Cumberland, \$13.00; Cannel, \$8.50; Welsh Anthracite, \$13.00; Rock Springs, \$8.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13.00 in sacks; Sunnyside, \$8.50, long ton.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 23@24¢ lb.; carloads, 23@23½¢; in tins, 30c; soda ash, \$2.00 lb. 100 lbs.; hyposulphite of soda, 3@3½¢ per lb.; caustic soda, in drums, 3@3½¢ lb.; Cal. s. soda, bbls., \$1.20@1.40 lb. 100 lbs.; sks., \$1.05; chlorate of potash, 12@13¢; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2½¢; powdered sulphur, 2@3¢; flour sulphur, French, 3½@3½¢; alum, \$2.00@2.25; California refined, 1½@2¢; sulphide of iron, 8¢ lb.; copper sulphate, 5½@5½¢; chloride of lime, spot, \$2.50@2.75; sulphuric acid, in carboys, 66% B, 1½@2¢ lb.; nitric acid, carboys, 8¢ lb.

OILS.—Linseed, boiled, bbl., 57c; cs., 62c; raw, bbl., 55c; cs., 60c; Lucol oil boiled, bbl., 50c; cs., 55c; raw, bbl., 48c; cs., 53c. Kerosene—Pearl, per gal., 19½¢; Astral, 19½¢; Star, 19½¢; Extra Star, 24c; Eocene, 23c; Elaine, 26c; Water White, in bulk, 13c; Mineral Seal, iron bbls., 18c; wooden bbls., 20c; cs., 24c; Mineral Sperm, cs., 26½¢; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22½¢; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 13c; do., in cs., 19½¢; Lard Oil, E. W. S., bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Sperm, crude, 63@68c; Natural White, 63c; Bleached, do., 57c; Whale Oil, cs., 52@57c.

ALUMINUM.—No. 1, 99%, small lots, 37¢ lb.; 100 lbs., 35c; 1000 lbs., 34c; ton lots and over, 33c, Pittsburgh. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburgh.

BORAX.—Concentrated, 6@7¢ lb.; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

BONE ASH.—Extra No. 1, 5@6¢ lb., No. 1, 4@5c.

RED LEAD.—500 lbs. and over at one purchase, 7c; less than 500 lbs., 7½c.

LITHARGE.—Pure, in 25-lb. bags, 8@9¢ lb.

MOLYBDENUM.—Best, \$2.00 lb.

CHROMIUM.—90% and over, 80c.

PHOSPHORUS.—American, 70c.

SILVER.—Chloride, 90c@1.00; nitrate, 55c.

MERCURY.—Bichloride, 77c.

MAGNESIUM.—Pure, N. Y., 60c.

MANGANESE.—Metal, 60c.

SODIUM.—Metal, 60c.

BISMUTH.—Subnitrate, 82.10.

URANIUM.—Oxide, 83.50.

FIRE BRICK.—Domestic, carloads per 1000, f. o. b., factory square, \$25.00; soap and split, \$22.50; arch and wedge, \$27.50; skewback, \$30.00; circle, \$32.00.

FIRE CLAY.—Domestic, per ton 2000 lbs. in 125-lb. bags, double, and dry ground, f. o. b., factory, \$8.50.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

NOTICES OF RECENT PATENTS.

Among the patents recently obtained through Dewey, Strong & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

CUTTER FOR BUTTER, ETC.—No. 770,476. Sept. 20, 1904. Romeo Pozzi, Marysville, Cal. This invention consists in the combination of mechanism and devices by which the article to be cut is intermittently advanced between the movements of the cutting device and means by which the rate of advance and the thickness of the slices cut may be varied. It is especially designed for cutting butter from the block or roll into sheets of any desired thickness and subdividing said sheets to make the smaller divisions or parts designed for table use.

STEAM DOME AND BREACHING.—No. 770,465. Sept. 20, 1904. C. A. Huffmaster, San Leandro, Cal. This invention consists especially in the novel arrangement of the steam dome and an internally disposed breaching and connections whereby the hot products of combustion after passing through the boiler flues are carried through the breaching to the stack so as to heat the steam contained within the dome, while the effect of the surrounding steam is to prevent the burning out of the breaching. The invention comprises a means for diverting the upwardly moving gases and throw-

ing them more directly against the interior surface of the breaching before said gases escape from the stack and other details of construction.

## New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR WEEK ENDING SEPTEMBER 20, 1904.

770,250.—COLLAR—Alkus, Sinclair & Krizbaum, Oakland, Cal.  
770,669.—BOOK CLAMP.—J. N. Bos'ick, Fresno, Cal.  
770,672.—CULTIVATOR.—J. L. Buckingham, Laton, Cal.  
770,662.—WEARING APPAREL—Alice H. Dessart, Nogales, Ariz.  
770,428.—SMUDGE—E. J. Griffiths, Los Angeles, Cal.  
770,309.—GAS METER.—A. Henning, S. F.  
770,465.—STEAM DOME—C. A. Huffmaster, San Leandro, Cal.  
770,338.—HAND BRAKE—Maguire & Young, Reno, Nev.  
770,378.—ELECTRIC SWITCH—Mehrtens & Howard, Exeter, Cal.  
770,474.—SPOKE PULLER—A. K. Olsen, Hubbard, Or.  
770,476.—BUTTER CUTTER—R. Pozzi, Marysville, Cal.  
770,508.—INTERLACING MACHINE—A. E. Sexton, Los Angeles, Cal.  
770,446.—ADDING MACHINE—A. P. Simpson, Sacramento, Cal.  
770,328.—DISK HARROW—G. Smith, Colfax, Wash.  
770,401.—CHURN—H. A. Thomasson, Whatcom, Wash.  
770,518.—PUMP PISTON—P. J. Waller, Los Angeles, Cal.  
770,514.—SNATCH BLOCK—Walters & Prichard, Goldbar, Wash.

## ASSESSMENT NOTICES.

GOLDEN WEST MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 17th day of September, 1904, an assessment (No. 2) of one (1) cent per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 307 Battery street, Room 15, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of October, 1904, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 28th day of November, 1904, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
CHAS. BOVONE, Secretary.  
Office—307 Battery street, Room 15, San Francisco, California.

TESTS HAVE PROVEN.—Leading plant operators the world over have tested the BURT EXHAUST HEAD and their verdict is that it is PERFECTION.

It stops the dripping and spraying of water and oil that comes from the exhaust pipe—it allows nothing but dry steam to escape, hence it saves roofs and walls from damaging effects of steam.

"The Burt Exhaust Head is giving satisfaction." American Sewer Pipe Co., Pittsburg, Pa.

THE BURT MFG. CO.,  
Largest Manufacturers of Oil Pumps in the World,  
221 Main St., Akron, Ohio, U. S. A.  
Supplied also by Engine Builders,  
Dealers and Power Contractors.

THE CALIFORNIA DEBRIS COMMISSION having received application to mine by hydraulic process from E. J. Gordon and P. McElroy, in Messer Mine, near Mountain House, Plumas County, Cal., draining into Spanish Creek, which reaches Feather River, gives notice that a meeting to receive any protests will be held at Room 96 Flood Building, San Francisco, Cal., Oct. 17, 1904, at 1:30 P. M.

## WANTED TO BUY FOR CASH. TUNGSTEN ORES (Wolframite, Huebnerite and Scheelite.)

Molybdenum, Bismuth and Vanadium Ore.

PRIMOS CHEMICAL CO.

Telegraphic address: Philadelphia, Pa

PRIMOS, DELAWARE CO., PA

## ORE TESTING

We have the most complete Ore Testing Plant in the United States for the testing of ores of all characters by any of the modern methods of ore treatment. We determine the best and most economical method of treating ores and contract to design, erect and turn over in complete working order Ore Milling Plants of any description, and guarantee efficiency and capacity. Our Catalogue No. 39 describes this department fully.

### SITUATIONS WANTED.

A CAPABLE MINING ENGINEER AND MINE manager desires position as manager or superintendent; 18 years' experience. Speaks Spanish. Good references. Address H. A., this office.

A FOREMANSHIP OR SUPERINTENDENCY. Twelve years' experience, practical mining. Possesses technical knowledge necessary for economical ore extraction. Address Edward W. Ralph, 602 W. Broadway, Butte, Montana.

AN EXPERIENCED MAN DESIRES A CHANCE to hunt for lost mines—gold, quartz and copper—or to do field work. Would go on salary and expenses paid, or for a percentage on value of discovery. Address R. M. Gill, What Cheer House, San Francisco, Cal.

COMPETENT MINING ENGINEER WANTS opening with city firm or individual to do expert mining, mill or cyanide work. Moderate salary to start. Address R. B., care of this office.

CYANIDE CHEMIST DESIRES POSITION AS Cyanide Superintendent; 8 years' experience; understands milling; good assayer; best of references. Address "Cyanide," Box 1323, Denver, Colo.

CYANIDE MAN, ASSAYER, SURVEYOR AND Draftsman, competent to keep mine books. Young man, unmarried, good habits, and worker; thorough, systematic and progressive. No objections to anything new. Address "Buckeye," care of Mining and Scientific Press.

DETECTIVE AND PEACE OFFICER OF 27, with seven years' experience on Pacific coast, desires position with mining company as watchman or special officer. Best of references. Address Lock Box 71, Redding, Cal.

EXPERIENCED CYANIDE MAN AND ASSAYER wants opportunity to learn milling. Unhindered. Address "H. W. Metallurg," care of Mining and Scientific Press.

EXPERT MINE FOREMAN WANTS POSITION. Competent to handle extra difficult conditions underground. Address "Limestone," Room 602, 380 Market St., S. F.

MINE SUPERINTENDENT WANTS POSITION. Capable miner, mill man, cyanide man and assayer. Address R. P., this office.

MINING COMPANIES AND MINING ENGINEERS installing steel cyanide tanks and desiring a first-class boiler maker familiar with class of work to do the erecting and riveting for them, address Box 25, this office. Best of references.

POSITION DESIRED BY AN ELECTRICAL and Gas Engineer; technical graduate; three years' experience in electrical work, eight years' experience in the operation of gas engines; will accept position in either line, but prefer to combine the two. Address R. W. Shoemaker, 613 E. Sixth St., Los Angeles, Cal.

WANTED—POSITION AS SUPERINTENDENT or assistant sup't by a practical man; first-class chemist and assayer. Specialty: Reduction work, milling and smelting. Address X, this office.

WANTED—POSITION BY EXPERIENCED Mining Stenographer, Bookkeeper and Assayer, with reliable mining company. Address A. R. Wistrand, Wrangell, Alaska.

### HELP WANTED.

COMPETENT APPLICANTS FOR ANY ENGINEERING positions furnished to employers without charge. Experienced men wanting such positions should write for terms. Cleveland Engineering Agency, Rose Building, Cleveland, O.

WANTED—SALESMAN TO SELL PUMPS, Engines, Boilers, Motors, etc. Preference given engineering education or experience. State terms. Address Box 28, care of this office.

# TRAYLOR CENTRIPACT SCREEN.

Its classification of pulp by size of particles is admittedly superior to hydraulic classification.

Centrifugal force and upward impact does it.

In wet screening no spray or additional water is required, that coming with any pulp being amply sufficient.

Only ten square feet of screen cloth to be renewed in place of eighty to one hundred square feet, as on the revolving screen.

No "balling up" of wet pulp is possible on the Centripact Screen.

The head movement is enclosed in a dust-proof case containing oil, all working parts thus operating in oil.

Traylor Engineering Co.,  
118 Liberty St.,  
New York, N. Y.

## What Is Meant by Mineral.

At times serious disputes arise between the adverse claimants of a mining location as to the sufficiency of the discovery. As to the character of rock in a discovery the statutes are silent, the only requirement being "mineral-bearing rock in place." The mineral-bearing rock need not necessarily be a vein or deposit of definite shape, size or form, but must be mineral bearing. Not infrequently valuable mineral—gold or silver, or copper, lead or zinc sulphide—may occur in payable quantity in one portion of a rock when another portion of the same rock mass, a short distance away, may be commercially worthless or actually destitute of metallic minerals, of their sulphides, or of the secondary products of their oxidation.

The words of the Statute are, "veins or lodes of quartz or other rock in place." What constitutes a lode is a somewhat indefinite proposition, but it is as often determined by commercial as by geological considerations. By "in place" is meant in its original position and not in detached pieces in the alluvial, or in a rock slide on the side of the mountain.

Payable mineral is not confined in its occurrence to quartz. It is often found in limestone, in shale, sandstone and various eruptive and intrusive and metamorphic rocks. Not infrequently the mineral-bearing rock or ore is similar in appearance to the barren

Quartz Mountain and App Mine, Mother Lode of California. (See page 237.)

Head Frame and Mill, Harvard Mining Co., Whisky Hill, Jamestown, Cal. (See page 237.)

The Dutch Mine, Quartz Mountain, Mother Lode of California. (See page 237.)

rock which surrounds it, and the rock only ceases to be considered ore when it no longer pays for its extraction and treatment.

It is for this reason that the phrase, "or other rock in place," was introduced into the statute. There is nothing ambiguous in the expression "rock in place." Every class of claims that may be classed as a vein, or lode, may be patented under the laws as a vein or lode of rock in place. This class of mineral lands contemplates all of those wherein the mineral is contained in veins, whether fissure or gash veins, or any of the several other forms of mineral deposition. Miners not infrequently claim that a newly discovered vein is not "in place," but has slipped down the mountain or hillside from some other claim. This is rarely the case, and usually there would be no difficulty for a geologist to prove to the satisfaction of the most skeptical that nothing of the sort had ever occurred there.

The word "mineral" as applied to veins in the statutes has a somewhat different significance than when used otherwise—for all rocks, whether metal bearing or not, are recognized as being composed of one or more minerals. Mineral, in the mining statutes, has a more restricted meaning, and is understood to imply an ore or mineral substance having a commercial value. A gold-bearing rock is properly mineral, and granite has been determined by the courts to be mineral. A valid "discovery of mineral-bearing rock in place" may be made and a claim taken wherever mineral can be found on the unoccupied public lands of the United States, and the courts have never insisted that mineral must be found having a commercial value, in either quality or quantity. This is left to the judgment of the locator, who is presumed to know whether or not the "prospect" is sufficiently good to locate and develop under the requirements of the law. A statute that required payable ore in sight before a valid location could be made would make many mining locations impossible.

Judge Hawley, in the case of Brook vs. Justice M. Co., 58 Fed., 106, 124, said: "Logically carried out, it would prohibit a miner from making any valid location until he had fully demonstrated that the vein or lode, of quartz, or other rock in place, bearing gold or silver, which he had discovered, would pay all the expenses of removing, extracting, crushing and reducing the ore and leave a profit to the owner. If this view should be sustained, it would lead to absurd, injurious and unjust results."

THE annual estimate of gold and silver production of the United States for 1903 has been made public by G. D. Roberts, Director of the Mint. It shows a total production of over \$100,000,000, being about \$6,000,000 less than that of the fiscal year 1902, due chiefly to the suspension of mining operations in several of the most important producing camps in Colorado for a period of several months. The total production of the world for 1903 is estimated at about \$320,000,000 gold and \$88,290,000 silver, the latter being figured at 54 cents per ounce. The figures indicate a gain of more than \$30,000,000 over the production of gold and silver in 1902. These figures are estimates and the exact figures cannot be obtained before the latter part of the year. Detailed figures of production by States and counties are given elsewhere herein.

SOME interesting statements have recently come from the Transvaal Chamber of Mines relative to the work of the Chinese laborers now employed in the mines of the Rand. Out of 1182 men at the Van Ryn mine 1018 were reported working, of whom 556 were underground and 462 on the surface. On August 2 an average of 15 inches per shift was made in drilling by 130 coolies and on the 16th of the month the average made by 300 men was 22 inches, showing either an improvement, or more favorable conditions for work. This is about one-fourth to one-fifth of what a skilled white miner would accomplish in the same time. In another mine the average was about 14 inches, some of the men doing nearly 36 inches. The mine managers appear well pleased with their experiment, and anticipate a material improvement in the amount of work accomplished per man when they become more experienced. In the work of mucking they make a better relative

showing than in the more skilled work of drilling, but in this as well as drilling they are no match for the white miners and not even as good as Kaffirs. The labor problem appears nevertheless to have been solved by the Chinese on the Transvaal, and 5000 more have gone in since Sept. 15. The difficulty at first experienced with Chinese officials in recruiting seems to have been satisfactorily settled.

## Keeping Records.

Every careful business man recognizes the value and the necessity of keeping systematic records of all operations; and this is not more true of any single line of activity than it is of engineering and mining works. The mine superintendent who is driving a tunnel or other opening in under former and flooded workings is not operating "in the dark" if he has reliable and carefully kept records and surveys of work done above him. He can drive ahead intelligently, without delay, and without fear of unexpectedly opening into the thousands of tons of water above, and flooding out his men, possibly with a loss of life. In case connection is to be made between different sections of a mine, without the surveyor's records, one would have to guess his way and would likely do much unnecessary work. Then, too, in drifting or other work in the mineralized formations, if samples are taken systematically, and distances and values recorded as driving progresses, the mine owner or manager can tell at any time just what quantities and values of ore he has available. If a written account of diamond-drill-hole prospecting were not kept, showing the character of every foot (even of inches) traversed and its value or lack of value—if such data are not on paper, the drill hole is useless to the superintendent or manager who may succeed the man under whose direction the work was done, and even useless to the one who did the work, unless he has a remarkable memory. Equally sensible and useful would be the prospecting by well-boring apparatus of auriferous gravels for dredging purposes without a carefully kept account of the same. The lack of just this sort of data and information is, according to reports, being felt at the present time by a number of operators in the Beaumont, Texas, oil fields. In the boom days of a year or so ago all were intent on striking a "gusher." Many wells were put down hurriedly and without thought of keeping a "log" recording the location and thickness of the various strata passed through. Not even the minor oil-bearing sands pierced were accurately noted. The oil sand yielding the gushers was the one sought for. Now that the excitement has subsided those who kept careful records are profiting by their foresight and are perforating the casings of many of their abandoned wells at depth of the several oil sands and are getting a substantial yield therefrom. Without an accurate log of the well, they are as likely to strike a flow of artesian water by cutting the casing at the wrong place and thereby damage, or eventually destroy, the usefulness of the well.

## The Greatest Gold Mine.

The last annual report of the Homestake Mining Co. for the year ending June 1, 1904, which was recently issued, shows that about 1,300,000 tons of ore were mined and milled, the value of which was within a fraction of \$3.70 per ton, the bullion returns being \$4,800,558.40. This shows an increased tonnage, due to enlarging one of the mills, and it also indicates an increase in the value of ore milled by \$0.156 per ton, an interesting and important fact in consideration of the growing depth of the mines. Among the expenses for the year, \$194,769.69 were spent on the six shafts of the company; on mining, over \$2,100,000; on candles alone, \$19,833, and on dead work, but \$18,689. It is said the ore reserves are sufficient to last for twenty years without dead work, with the present capacity over 4000 tons daily, so that the relatively small amount of dead work is unimportant. The deepest shaft, the Ellison, is now down 1250 feet, the lowest level being at 1100 feet, where the vein is still of enormous width, stated to be about 500 feet. The company now operates 1000 stamps, which are in six mills. Although the Homestake owns the greater part of a strip of land 2 miles long and 2000 feet wide, the company paid out over \$200,000 the past year for new property.

## Modern Innovation.

The daily application of modern science to practical utilities has become so commonplace that we have ceased to wonder at anything. For years aerial navigation was a problem which presented so many difficulties that success was not looked for by any except the optimistic inventors of flying machines, but each experiment developed the weaknesses of the last effort and now it seems that there is a probability that aerial navigation is about to be solved to the satisfaction of those who desire to fly. Wireless telegraphy has become an established and accepted fact, but the field open to the application of electricity is still almost boundless. Metallurgical methods are constantly undergoing a change—newer and better ideas and practice supplanting the old. Undertakings which even a decade ago would have been considered inexpedient, if not impossible, are now accomplished daily and no longer attract unusual attention. Among recent innovations is the suggestion by a French engineer that a coal mine may be converted into a natural gas well and the gas used in various ways in the industries. His proposal is to sink two shafts in the Rouchamp coal field in France and to then set fire to the bed of coal, employing the gas generated which would rise through one of the "wells," the other being a down cast supplying the oxygen necessary for combustion from the air. The coal mines of the district are already very deep and the profit of their operation small, due to the expense of mining there under existing conditions. It is the idea of this enthusiastic engineer that the coal bed could be made more profitable in the manner indicated than by the usual methods of extracting the coal from the vein at great depth and raising it to the surface for use as fuel. This novel suggestion is merely indicative of the trend of thought in these days of progress and innovation. No branch of scientific investigation offers greater opportunities than the field of metallurgical engineering and the adaptation of known chemical reactions to the solution of problems in ore treatment. In many instances it is desirable to extract a higher percentage of values from ores than are being obtained, and in other cases it is desirable to reduce the cost of treatment where the percentage of extraction is already high. The experimentation now in progress is mostly being done by scientific investigators who patiently work along definite lines with a fixed purpose in view. There are few new processes offered to-day which can be successfully and satisfactorily applied to ore treatment that have not been arrived at by a long series of intelligently conducted experiments.

IN Mexico the country is generally prosperous, and an important factor in this connection is the recent completion and the present extension of a number of important railroads. Some years ago there was a large and influential element opposed to railway building in that republic, but the progressive people have secured the railroads and the conservative element, noting the prompt and direct benefits resulting following their completion, are now also favoring railroads wherever they may be needed. The policy of the Government has been favorable to railroad extension, but it is evidently the intention—for the time being at least—to subsidize no more new enterprises of this character. As the development of the country's resources progresses the need for subsidies becomes less urgent, and in the future it is probable that railroads must be built in Mexico without Government aid, depending solely upon the commerce of the section of the country through which the road passes for its reward and financial success.

EVIDENTLY in anticipation of industrial strife, the mine managers of Leadville have decided to issue working cards to all employees, presumably to resist the growing strength of the Western Federation of Miners in that district, as a large number of those who left Cripple Creek district are said to be in Leadville. Under the new arrangements, no man will be given employment at any mine who does not deposit with the timekeeper the association card. What effect this order will have has not yet become apparent, but as this action has been taken before any trouble appeared on the surface, it is probable that it will meet with little if any opposition from those already in the district and who are employed.

## CONCENTRATES.

THE sound of the voice can be distinctly conveyed in a straight pipe a distance of 1600 feet.

\*\*\*\*\*

AN alloy of nine parts of lead, two parts antimony and one part bismuth will expand in cooling.

\*\*\*\*\*

A BRASS casting will weigh eighteen pounds to each pound of the pattern's weight; an iron casting sixteen to one.

\*\*\*\*\*

IN figuring the size of the steam pipe, its diameter in inches equals the square root of one-sixth of the engine's horse power.

\*\*\*\*\*

AN ordinary burn from an electric current may be relieved by applying a solution of one part picric acid and seventy-five parts water.

\*\*\*\*\*

"SALT GLAZE" on bricks and certain kinds of tiles, pottery, etc., is obtained by introducing salt into the fire boxes while the articles are being burned.

\*\*\*\*\*

PUMICE is a spongy, frothy condition of lava. The name is also applied commercially to volcanic ash, used as a polishing agent. The principal supply is obtained from the island of Lipari, north of Sicily.

\*\*\*\*\*

THE construction and maintenance of lead-lined chambers in a sulphuric acid plant is usually expensive. Men called "lead burners" are employed constantly in looking after and repairing the lead sheets and joints.

\*\*\*\*\*

GOLD is associated with lead almost as often as with iron sulphide. Gold may frequently be seen in crystals of galena, though it is more commonly observed with pyrite. It also occurs with zincblende and often with mispickel.

\*\*\*\*\*

THE appearance of pure gold is often imparted to alloyed gold ornaments, by heating until the copper in the outer layer is oxidized; followed by dipping into nitric or sulphuric acid. The acid dissolves out the copper oxide, leaving a film of pure gold as the outer layer.

\*\*\*\*\*

GOLD LEAF generally contains 96.25% gold, 2.5% silver, 1.25% copper. After repeated rolling, cutting into squares, and beating with a heavy hammer, the final hammering is done between layers of gold-beater's skin. An ounce of gold may be spread out to cover an area of 100 square feet, and having a thickness of 235,000 of an inch.

\*\*\*\*\*

THE system of development usually applied to the opening of coal mines may be applied to metal mines as well; but such a system is not usually demanded by conditions obtaining in a metal mine. Fire damp is of rare occurrence in metal mines, and the cost of shaft sinking being generally much greater at metal mines, owing to harder rock, further discourages any attempt at sinking the extra ventilating shafts commonly found in coal mines.

\*\*\*\*\*

IT requires sixteen sacks of regulation size of iron sulphide to make one ton. The concentrates may contain from a fraction of 1% to 20% moisture. For very rich sulphides canvas sacks are better than burlap, as the fine sulphides sift through the coarse fabric of the latter, and in a long haul considerable loss results. There is less loss in transporting wet concentrates than in dry, though there is an increase in transportation charges due to moisture.

\*\*\*\*\*

BRIQUETTES for metallurgical purposes are usually made with from 5% to 10% of lime as a binder. Clay is also sometimes used, but its presence is often undesirable in the furnace or elsewhere. In some instances dilute sulphuric acid is employed, and the use of sugar-molasses is covered by patent. Other common binders used in the manufacture of artificial stone are water glass, magnesia cement, zinc chloride, gum arabic, glue, caseine and glycerine.

\*\*\*\*\*

THE impression which many have that certain kinds of rock or formation are indicative of the presence of gold, silver or other metals is erroneous. The kind of rock has no bearing on this important matter, but the condition of the rock is often an index of mineralization, if not of value. Almost invariably the rocks along the walls of veins and in their vicinity will be found greatly altered—sometimes silicified, sometimes much mineralized and decayed—but poor veins have these conditions as well as rich ones, though few of the latter are without such indications.

\*\*\*\*\*

CRUSHED STEEL is used principally in cutting and polishing stone (marble, onyx, granite, etc.) for ornamental purposes, also in grinding lenses, beveling glass, and by lithographers. Crushed steel is manufactured from high-grade crucible steel, heated to 2500° F. (nearly white heat) and quenched in cold water, giving it a granular structure. It is then crushed by hammers and classified into sizes from No. 6 mesh to No. 200. Sizes 6 to 60 are tempered to straw color, and sizes 60 to 200 still harder. Though crushed steel oxidizes readily, this

can be prevented by adding a little quicklime. The production of crushed steel in the United States in 1903 amounted to 755,000 pounds, of average value of 7 cents per pound.

\*\*\*\*\*

THE reaction which takes place in the electrical manufacture of carborundum is expressed by the equation:

While the principal use of carborundum is as an abrasive, it is, because of its refractory qualities, also being used as a furnace lining, both in the form of mortar and of bricks. Production in 1903 was 4,759,890 pounds—an increase of 1,018,390 pounds over 1902. In the process of manufacture the electric current has a pressure of about 100 volts, with 7500 amperes, and the current is kept on for thirty-six hours.

\*\*\*\*\*

FOR short electric power lines delivering a small amount of power at voltages of 40,000 or over, aluminum is preferred to copper wire, since it is found at these voltages a wire less than 1/2 inch diameter will discharge through the air, and this discharge may result in a considerable loss of energy. Consequently it is not advisable to use wire of less than 0.3 inch diameter no matter what the amount of energy or the distance is. Aluminum is preferable for the reason that at a definite size it is materially cheaper than copper. The action of salt sea fog is greater on aluminum wire than upon copper. Aluminum must be strung with reference to temperature at the time of erection, as its coefficient of expansion is about three times that of copper.

\*\*\*\*\*

ASSESSMENT work may be done on one of a number of contiguous claims in a group whether these several claims be all on one vein or on a number of veins, if the work so performed is manifestly for the benefit of all the claims of the group, \$100 worth being done for each of the claims of the group. The several claims must be contiguous, and not separated by other claims owned by other persons. The assessment work may even be done on ground entirely outside of the group of claims if on the public domain, such as running a crosscut tunnel to develop the several veins of the group. It is better, however, to do the work, if possible, within the boundary lines of the property, thus avoiding future possible complications.

\*\*\*\*\*

THE distance between levels in a mine is usually influenced by the conditions existing in the mine. In narrow veins of low dip—less than 40°—levels should not be more than 60 to 75 feet apart. In large veins of the same inclination a greater distance is permissible. In some mines levels are all established at 100 feet or over, because of the expense of drifting through hard rock at such short intervals. In good standing ground, where the vein is near the vertical, the levels may be made from 150 to 200 feet apart. If the ore passes are to be timbered, it has been found that timbers placed with their ends next the mill hole will wear longer than if their sides are exposed to the falling rock. Experience in each mine will soon demonstrate the proper distance to separate levels.

\*\*\*\*\*

THE relative merit of blowers and exhaust fans for mine ventilation is still a mooted question, some engineers favoring one system and others the other. The blowing fan sends a greater or less volume of fresh air from the surface into the mine workings, where it mingles with and dilutes the foul air present, which slowly passes out through the mine openings. The exhaust fan draws the foul air from the workings, and fresh air passes in from the surface through shafts or other openings, but on its way to the distant faces of the mine gathers up more or less foul gas, which is being constantly generated by decaying timber, or gas which results from the exhalations of the men. Carbonic acid gas also finds its way into the mine through crevices in the rocks. In some instances so strong is the inflow of this deadly gas that the work has had to be abandoned, as in at least one drift in the New Almaden mine, Santa Clara county, Cal. On the whole, the exhaust fan seems preferable to the blower, as it is calculated to withdraw the foul air, and fresh air may be expected to take its place. All old timbers should be removed to the surface as soon as taken down in repairing, and not thrown into some disused workings to rot and there create more foul gas. Decaying mine timbers generate a large amount of carbon dioxide, which is particularly noticeable in damp mines.

\*\*\*\*\*

THE advisability of changing the method of hoisting in a mine from cages to skips must be determined by the existing conditions. If there still remains a large amount of ore to be stoped and hoisted from levels already opened up, it may be advantageous to substitute skips for cages, and in new levels to be opened below the present lowest level it would be advisable to provide ore pockets beneath the stations to hold the waste and ore. At stations already established it may be considered too expensive to cut these pockets, usually at a cost of \$300 to \$500 for rock work, timbers, gates, labor, etc., together with a division of the pocket into two or more compartments. The cost will be determined by the hardness of the ground, its "good standing" quality or the reverse, and by the labor and repairs incident to blasting in a station already cut and timbered. Ore pockets can be cut at less cost when opening the station at the time of sinking than at any other time. The particular advantages of ore pockets and skips is in the bin

capacity afforded; the saving of time by dumping the car trammed from the stope to the station immediately upon its arrival. The saving of time in hoisting several skips in succession from any given level, the ore being taken from the accumulated supply, enabling the engineer to daily do all of his hoisting promptly between stated hours (except in very large mines where hoisting is constantly in progress day and night) and also in the fact that water as well as ore or waste may be hoisted by skips. In shafts sunk at any angle other than 90°, skips are undoubtedly preferable to cages. Where cages are used no expensive ore pockets are necessary. The cars go from the ore shoots in the stopes to the cage and are hoisted to the surface and trammed directly to the mill or wherever required. Materials may be handled somewhat more conveniently on cages, but there is a growing tendency to substitute skips for cages in large mining operations.

\*\*\*\*\*

THE water level in the Comstock mines of Virginia City, Nev., is an interesting problem. The great lode is drained by the Sutro tunnel to the 1750 level of the Savage mine, and this is approximately the level of all of the mines along the lode, those at Gold Hill being at a somewhat higher level at the collar of some of the shafts. The pumping operations at the Con. C. & C. shaft have lowered the water a few feet below the 2350 level of that shaft, and neighboring mines are drained to nearly that level, the "zone of saturation being approximately that of a concave oval," the outer rim of which grows higher with distance from the point of drainage. The lowering of water at any shaft along the lode to a point below this zone of saturation will create a second area of drainage similar to that now centering about the C. & C. shaft. Should pumping operations be undertaken at the Alta shaft, near Gold Hill, the result would be the formation of such a basin of drainage depressed to an extent dependent upon the lowest point of drainage. It is said to be the intention to drain the south end mines to the 3000-foot level. The best works on the Comstock mines are "The Comstock Lode," by John A. Church; "The Comstock Lode," by Clarence King, being a portion of the United States Geological Survey of the fortieth parallel; "Geology of the Comstock Lode," by Geo. F. Becker, Monograph No. III of the United States Geological Survey, Washington, D. C. (an abstract of this latter was published in the Second Annual Report of the Survey); "Comstock Mines and Miners," by Elliot Lord, Monograph No. IV of the United States Geological Survey, is a descriptive, historical and non-technical work on the lode. Probably the best work of the above with geological maps, etc., is Becker's report in Monograph No. III, to be obtained from the Director of the United States Geological Survey, Washington, D. C. Price \$11. It is difficult to purchase any of the above volumes at present from the Survey, as they are mostly out of print, but they may usually be found in any public library in the larger cities, and occasionally may be obtained in second-hand book stores.

\*\*\*\*\*

AMONG the mines of California that have been reopened after a long idleness and are again paying dividends are the Gwin mine, near Valley Spring, in Calaveras county. Formerly worked to a depth of 1540 feet, work suspended in 1882, owing to the capacity of the surface plant being overtaxed, and short-sighted "economy" of the management. Reopened in 1894, it is now down 1950 feet, with good paying ore in the lower levels. The Rawhide mine in Tuolumne county was successfully worked for years to a depth of several hundred feet. After a long idleness due to exhaustion of known ore bodies and no development work ahead, the mine was reopened in 1891 and has since been worked almost constantly and profitably to 1200 feet. The Soulsby mine in Tuolumne county produced \$6,000,000 but was shut down for years, cause unknown; now reopened and paying well. The Kennedy mine at Jackson was successfully worked to 750 feet from the surface in early days. After idleness of years it was reopened in 1885 and is now over 2600 feet deep. It has paid continuously since rediscovering the ore at 950 feet. The Oneida mine in Amador county was worked to a depth of 1000 feet. Remaining idle for years, it is now 2200 feet deep and said to be profitable. The Central Eureka mine, near Sutter Creek, Amador county (originally known as the Summit), was worked to a depth of 700 feet—ore lost. Reopening after many years of idleness, it has been paying dividends for several years and is now down over 2000 feet. The Bunker Hill, near Amador City, was idle for years, being worked down to 800 feet. It is now about 1500 feet deep, and is developing a large and valuable property, paying dividends. The Champion mine, near Nevada City, Nevada county, once pronounced "played out," is paying more largely than ever before. The Princeton mine, in Mariposa county, after twenty-five years of idleness is again a bullion producer and has been successfully working the past four years. It is down 1000 feet. The App-Heslep mine at Quartz, a producer in early days, was closed for years, but has been successfully working the past seven years. Several mines at Angels, Cal., have been successfully reopened after a long idleness. In this latter camp, the reasons for shutting down were various, but a change in existing conditions, improved milling processes and mining methods and in management has made producers out of idle mines. There are many other examples of similar conditions. The reopening of an old mine does not always meet with success, but the result can rarely be predicted. The only way to ascertain is by trial.

## The Mother Lode in Tuolumne County, California.\*

NUMBER III.

Written for the MINING AND SCIENTIFIC PRESS by W. H. STORMS.

The largest operations at present being conducted on Whisky hill are those under the direction and ownership of the Harvard Gold Mining Co. The mines are near the south end of the ridge and  $\frac{1}{2}$  mile west of Jamestown. The dolomitic zone is wide in this property, and, as is usual elsewhere on the lode, contains several large lens-like sheets of quartz, carrying auriferous iron sulphides. The pay zone in this property has been chiefly developed, however, in the greenstone schists which form the hanging wall country of the great vein of dolomite and ankerite. The shafts are vertical and, although started in the hanging wall country at some distance from the outcrop of the main lode, which dips to the eastward at about 60°, they have passed through the intervening schists and the lode itself, passing into the serpentine foot wall. No pay shoots of more than nominal value have been developed in the main vein of this property, but in the greenstone schists silicified zones carrying auriferous pyrite and free gold have been found and extracted by the usual mining methods, and milled in the company's 60-stamp mill. The accompanying engraving shows the head frame of the South shaft, and the mill. The occurrence of pay rock in the hanging wall schists of this mine might have been anticipated, for at the surface these schists—soft and decomposed to yellowish brown slaty masses—had been honeycombed by the early-day miners, who are reported to have taken out a large amount of gold from this zone of schists. These pay zones are variable in size, the largest being 30 to 40 feet in width. There are some unusual and interesting intrusions of diabase dikes exposed in the workings of this mine. The hanging wall of the mineralized schists is barren, hard, greenstone schist. Crosscuts extended into this rock have failed to discover values in that direction.

The mill is run by two 75 H. P. electric motors, thirty stamps being connected with each motor. The mill is well equipped to do good work amalgamating and concentrating the class of ores found in that property.

The main lode extends several hundred feet to the southward from the Harvard mine, the usual characteristics being well developed and exposed by erosion and shallow mine excavations. No large developing has been done here, though some good ore is known to exist. The lode disappears beneath the surface just before reaching Woods creek, and is not again recognizable for a distance of  $\frac{1}{2}$  mile. In place of the large vein of ankerite or dolomite, with its prominent quartz lenses forming a ridge line of outcrop, only the usual varieties of amphibolite schist are seen, and the surface of the ground along the line which the vein would occupy if present, and its vicinity, is low and rolling, a physical condition characteristic of the more readily eroded schists. Upon the first reappearance of the lode proper, however, the ground rises once more in a ridge, and on this is situated the Dutch mine, one of the most extensively developed mines of the lode.

The Dutch mine at Quartz has the usual characteristics of the mother lode in this county. Its broad iron-stained croppings, with included white quartz veins, were prominent features of the landscape before they were cut down by grading and the outcrop covered with buildings. In grading for the surface works at this mine several thousand dollars were found in pockets of gold within a few inches of the surface. One of the peculiar characteristics of the lode in the Dutch mine is the formation of pay shoots which cross the vein diagonally from the foot to the hanging wall side. The principal development of this mine, unlike its neighbor, the Harvard, is in the ankerite vein and not in the hanging wall amphibolite schists. The ankerite zone in the Dutch mine is about 60 feet wide, and within it occur many veins and lenses of quartz carrying gold and auriferous pyrite, which is distributed erratically—some of the quartz lenses being richer than others in gold, and also containing a higher percentage of pyrite. The better pay shoots are found usually on or near the foot wall of the ankerite zone. The foot wall of the lode is chiefly amphibolite schist, although diabase, clay slate, gabbro, tufaceous slates and serpentine also occur. The hanging wall country is chiefly amphibolite schist, in which are found occasional silicified zones which in some instances are gold bearing. Since the formation of the lode there have been earth movements which have resulted in creating a number of reverse faults. None of these displacements are of great magnitude, but indicate the comparatively recent stresses to which the lode has been subjected.

The Dutch mine is illustrated in the engraving on the front page. A few hundred feet south from the Dutch mine is the eminence known as Quartz mountain, caused by the superior resistance to erosion of the harder quartz and vein material of the lode.

One of the engravings on the front page gives a good view of Quartz mountain, its peculiar topography being due to geological conditions, and this is characteristic of these occurrences in this county, though the hills usually occur as long ridges rather than as isolated peaks. Quartz mountain is not really an exception to this, however, as its main axis is several times longer than its width. On this hill are the mines of the App company at the north end and those of the Santa Ysabel company at the south end.

(TO BE CONTINUED.)

## Purple of Cassius Test for Cyanide Works.

Rapid and exact as is the colorimetric method for the determination of the gold in cyanide solutions, I thought that a quicker and simpler method might be desired and I therefore propose the following, which has so far given me satisfactory results, writes A. Prister in the Journal of the Chemical and Metallurgical Society of South Africa.

This method is based on the same principles as those in my colorimetric method, namely, precipitate the gold from a cyanide solution with zinc fume or dust, dissolve the excess of zinc with dilute sulphuric acid, dissolve the gold in aqua regia and add few drops of tin chloride. Compare the color obtained with a standard as described in my colorimetric method.

The cyanide solution to be tested must be strengthened by the addition of a few drops of a strong cyanide solution, say of 15% KCy, so that the solution to be assayed may contain 1% free KCy. To 200 cubic centimeters of the solution add about 1 gram of zinc dust. Heat the solution to boiling point. Filter off the cyanide solution. Add to the remaining zinc dust about 20 cubic centimeters of dilute (10%) sulphuric acid and dissolve all the zinc by gently warming. Filter off through the same filter the solution of zinc sulphate formed. Dissolve the residual metals in 10 cubic centimeters of aqua regia and pass while boiling repeatedly through the same filter and collect the gold solution in a test tube.

To the gold solution a few drops of stannous chloride are added, after the solution has been cooled by holding the test tube in water.

If the solution is rich on gold, the purple of Cassius coloration will appear directly; if it is poor, the color will require a few minutes to become evident. The aqua regia used can be made by mixing six parts of strong hydrochloric acid, two parts of strong nitric acid and six parts of distilled water.

## An Alum Deposit in Nevada.

About 10 miles north of Silver Peak, in Esmeralda county, Nev., is a deposit of alum and sulphur which has been many times located and prospected as a sulphur mine. Not until recently, however, has the relatively important amount of alum in it been recognized. During the last year the deposit was examined by J. E. Spurr of the United States Geological Survey, who has written an account of it which has been published in the Survey's bulletin (No. 225) entitled "Contributions to Economic Geology, 1903."

At the locality mentioned there is an elongated, neck-like mass of rhyolite which is decomposed in parts to a white, powdery variety. This is especially true of the two portions examined, which are about 600 feet apart, one about 200 feet in diameter, the other about 30 feet. The former, at the south end of the area under consideration, contains the chief alum and sulphur deposits. The latter contains sulphur, but no alum. In the larger area the decomposed rhyolite shows sulphur throughout, in all cracks and crevices, but never, so far as seen, in coatings over a fraction of an inch thick. Analysis of the alum by the chemist of the Survey shows it to be an ordinary potassium alum. It forms veins, some of them several inches thick, that split and ramify irregularly through the broken masses of altered rhyolite. There are also occasional gypsum seams, of the same habit as the alum, but much less abundant; also bright red spots thought to be cinnabar.

When exposed to the air the alum rapidly crumbles to a white powder, so that it is not conspicuous in the outcrop, and the real amount of it present is visible only when it has been taken out. The decomposed rhyolite within the productive area is so friable that the material could easily be worked on a large scale. The rhyolite itself in the alum locality has been found by analysis to contain a large percentage of alum. The whole deposit, therefore, would have to be worked, and the sulphur could be collected as a by-product.

No more expeditious or economical method of prospecting could be adopted in the glacial drift-covered area of Leadville, Colo., district than that of sinking bore holes. It is now the intention to sink other shafts on Rock hill to explore extensively the strata known to exist beneath the glacial drift. The ore discovered in these explorations will give a decided impetus to prospecting in the entire region south of California gulch, south and southwest of Leadville, not already explored.

## Peculiar Explosion of a Powder Thawer.

Written for the MINING AND SCIENTIFIC PRESS by  
MATT. W. ALDERSON.

Once upon a time I was working in a crosscut in a mine all by myself. Knowing I would need powder for blasts at the noon hour I put two candle ends under my thawer, as I went to work in the morning, so that the powder would be warming while I was working. Half an hour after I had commenced drilling I was startled by an explosion. I knew there was no one but myself in the mine and it seemed almost impossible that the powder in my thawer should have exploded. I had remembered that I had seen that there was plenty of water in it but a few days before. Even if the water had all been out it didn't seem possible that the powder could have been raised to such a degree of heat as to cause an explosion in the short time the candles had been under it.

I was using a good thawer and keeping it in a crosscut about 200 feet away from where I was at work, so I walked out to see what was the matter. Some smoke was coming out of the crosscut and I postponed going in for awhile. When I went in I found the upper part of the thawer intact except a few holes in the bottom. I lifted the lid and the five sticks of dynamite the thawer contained were there hard and cold. The ground upon which the thawer had stood was all wet from the water which had run out of the thawer through holes made by the explosion. The lower part of the thawer was twisted out of shape, as shown by accompanying illustration, and

The Thawer After the Explosion.

it was evident that the explosion had taken place under the thawer. What could have caused it?

I was using No. 1 Hercules dynamite and the thawer had stood in one position for several months. I had noticed sometime previous that in the thawing of the powder the paraffine used in wrappers had run a little down one side of the thawer (which was slightly lower than the other) and that on the ground along the edge of the thawer on that side was a white coating of paraffine, perhaps a quarter of an inch thick in places. I had questioned if I wouldn't better wipe the thawer and move it to new ground, but I had not done so. It was evident that the force of the explosion had come from the side of the thawer where this paraffine deposit had formed. I was in the habit of using but one piece of candle at a time in warming the powder, as that would get it sufficiently warm by the time it would be needed. But this morning I had in my pocket a little piece about half an inch long and, setting a longer piece near the center, I had also used the shorter piece, setting it out near the edge, so that the heat from it would not affect the longer piece. The explosion had occurred about the time this short piece would have burned down, so the probabilities are that the paraffine—containing more or less nitro-glycerine—had been fired in some way from the blaze or heat of the wick from this candle end, thus causing the explosion.

Some years ago a prospector in Fergus county, Mont., carried the powder he needed to a prospect near the top of the Judith mountains in a can of warm water. After using the powder he emptied the water into a pail in which he tempered his picks. One day as his pick touched the surface of the water there was an explosion, from the effects of which he lost an eye.

A miner in Jefferson county, Mont., was in the habit of warming his powder by an open fire. When warmed he would carry it into the mine rolled in a piece of blanket. One day as he was warming the blanket before the fire preparatory to wrapping it around the powder the blanket exploded and one of his hands was ruined for life.

All these explosions belong to the same class and it is possible to explain some explosions elsewhere considered more or less mysterious. They emphasize the need of greater care in one particular. The Rundle thawer is an excellent one, especially for the prospector and small operator—where not to exceed twenty-four sticks will be needed at one time. I know of no other thawer where the powder can be warmed with so little "candle power." But in light of the experience given above, I think the sides should be wiped occasionally when it is warm and that one should keep a plate or pan under the thawer in which to set the candles. Then by no possibility could the flame reach the drippings.

\* See illustrations on front page.

## Observations on Tonopah and Goldfield.

Written for the MINING AND SCIENTIFIC PRESS by S. C. WIEL.

The mineral wealth of the hills throughout Nevada has been largely silver, contained in argentite, the sulphide, as on the Comstock and at Eureka. This has, with other evidences, given ground for calling the great basin a geological province, distinct in structure as well as topography from the regions east and west of it. The discovery of Tonopah, with its silver deposits, was only another instance confirming this. But the free gold deposits of Goldfield, 26 miles south of Tonopah, are a decided exception.

The physiography of the country about Goldfield appears as follows: At the eastern horizon lies a long mesa, rising gradually and near the middle of the view, giving place to a series of irregular hills. Next to these hills stands a group of jagged peaks closely resembling eroded volcanic pipes. These pipe-like hills slope down to a gulch and just above the gulch, on that slope, lie the mines. In the gulch itself lies the camp. Turning now to the west, the side of the camp gulch rises suddenly in a perpendicular scarp-like cliff, 200 feet or more high. Its sides

and Goldfield are simple. At the start the richest claims were divided usually into 100 feet lengths and leased. The lessees each sank a vertical shaft reaching sometimes 300 feet deep, but usually less, and crosscut to the vein if it was not itself vertical; then drifted and stoped. Many of the lessees became rich in this way, and although the leases expired long ago at Tonopah, they are now much in demand at Goldfield. The country rock being volcanic lava (at Tonopah E. J. Spurr says it is mostly andesite) is hard and compact, and stands almost everywhere without timbering. In the Valley View mine at Tonopah stulls have been put in the stopes from side to side of the empty spaces, and found sufficient for thousands of square feet of stopes. The shaft stations are usually timbered. Ventilation is usually supplied by small blowers; in the Mizpah mine they have put a large pipe down an old prospect shaft which then was filled in, leaving a horn on the surface, like a funnel for furnace draft on a steamer. The ore taken out in the drifts and stopes, and waste from the crosscuts, is loaded into buckets on trucks, which are then sent along rails to the shaft, where the cable is hooked to the bucket. A cross-head above the bucket keeps the bucket steady.

The shafts are vertical, usually two-compartment, though the New Mizpah is three-compartment. They

flat cars with unsacked ore from its dump by a self-acting tramway.

So far the scarcity of water has interfered with the milling on a large scale. But a new water plant is now being installed by the Rye Patch Water Co. It is expected that this will lower rates about one-half and permit the milling of gold ores running \$15 to \$20 a ton, which are found within 5 miles or so of camp and are at present commercially unavailable. The water is secured from wells arranged in series, with a central pump station, and is to be sent to camp through 16 miles of 1-foot diameter pipe. It will have a capacity of 2,000,000 gallons in twenty-four hours.

The largest mine, the Mizpah, owned by the Tonopah Mining Co., is opened by three connected shafts, all vertical. The main shaft—the Mizpah or Siebert shaft—is equipped with an extensive surface plant, having a steel gallows frame, and is wired for electric lights. It will hoist cages instead of buckets, as at the other mines, and has three compartments—the largest shaft at Tonopah. It is down 900 feet, but not yet in active use, as the railroad cannot yet handle the ore now on the dumps on the surface. The ore lies in defined veins in this mine, as in the others. Values are said to run as high as \$300 a ton, though the average is between \$60 and \$80.

Fault Scarp at Goldfield, Nev.

The Jumbo Mine at Goldfield, Nev.

McNamara Mine, Tonopah, Nev.

Tonopah Extension, Tonopah, Nev.

show exposed strata of lava; and at its top is a layer that causes the surface to continue westward in a mesa, dipping slightly in that direction to the foot of another scarp, like the first, rising out of it, and topped by another mesa. This is repeated westward to the hills at the horizon, so that in looking westward from the camp, it seems like a series of broad steps, entirely different from the pipes and jagged hills to the east. The general appearance of the mesas suggests a series of faults. This appearance is supported by the repeating in the scarps of the layers of lava exposed on the cliff that bounds the gulch. That the lava beds lie also under the gulch and that the gulch is merely the surface of another mesa abutting on the hills to the east is suggested by its form, like the long side of a distorted V, of which the west scarp is the abrupt short side, more of a V trough than a rounded out gulch; and, also, by the fact that water is struck in wells within 50 feet anywhere in the camp, indicating an impervious lava bed near the surface. The mines occur where this series of step-like mesas abut upon the pipe hills.

It is suggested that the scarp of each mesa represents a fault line, and that the mines occur in a faulted region, at the contact of this mesa field with the pipe field; that the mesas represent an extensive westward lava flow from these pipes, divided by step faulting.

The methods of mining employed both at Tonopah

are usually lagged all the way, and, though the mines carry no water, there is a 15 to 20-foot sump to facilitate sinking. At the surface the bucket is dumped by hand (not automatically) into cars and thrown upon mounds, one for waste and one for ore. By this time all the Tonopah mines of consequence have considerable ore on the dumps, waiting for the railroad to take it to the smelter.

The ore in Tonopah is usually argentite. Some of it is treated in a local mill, in charge of W. J. Douglas, manager of the Tonopah-Midway Mining Co. There are ten stamps in this mill, from which the ore passes to eight Huntington mills. Copper sulphate ( $\text{CuSO}_4$ ) and salt ( $\text{NaCl}$ ) are added in a heated solution. As the mill revolves, amalgamation takes place, and the amalgam is drawn off at the bottom, yielding between \$1000 and \$1500 a day. Power is supplied by a three-cylinder engine, run by direct combustion of crude oil mixed with compressed air, furnishing 80 H. P.

This mill is treating ore from the Valley View claim of the Tonopah Mining Co. It is not expected that the mill will handle all the ores of the district, since some of it carries manganese, which interferes with amalgamation, and some carries sulphurets, which would have to be roasted. At the McNamara they carry stephanite, an antimonial silver ore. The bulk of the ore is shipped to Salt Lake City smelters. During August the Tonopah Mining Co. was loading

There is no water in the mine, and very little timbering is required. The accompanying illustrations are of mines at Tonopah and Goldfield.

At the Midway mine, down 635 feet, they are under a 450-foot capping of greenish lava, known as the later andesite, which forms a blanket over the veins in most mines of the district. They have cut three veins underground, none of which cropped out on the surface, but were prospected for by sinking through the capping, having first chosen a place that seemed likely, calculating on the trend of the veins in neighboring ground, for most of the veins strike regularly east and west, dipping a little north. The capping above mentioned is absent in the Mizpah, having been removed by erosion, thus giving that mine more backs than most of the others at a corresponding depth. The values in most of the mines are not uniform. Bunches of rich ore are found here and there, which have been followed in short crosscuts or small stopes.

As the mines develop and extraction of the ore begins in earnest, the camp is likely to become a good-sized town, owing partly to the number of men likely to be employed, and partly to the fact that many districts opened near by, such as the Ray district and Goldfield, look to Tonopah at present as their headquarters. There is a plan on foot to move the county seat from Belmont to Tonopah, which, however, would be of doubtful advantage, as it would facilitate

suits at law, where now the distance of the court across a dreary desert forces most to settle their disputes out of court. One of the strong influences in building up a mining town—a smelter—is not likely to be realized, owing to existing conditions, and at present everything is being planned to ship to Salt Lake. At present the camp is an irregular gathering of wooden and adobe cabins, with tents here and there on the outskirts. Through the middle runs a broad street along which an occasional stone house of one or two stories will be found. The ground on which the camp is built is owned by the mining companies, held by possessory rights, none of the mines being yet patented, though the Tonopah Mining Co. is now proceeding to patent. Some of the companies have promised deeds to the men who have built on their claims—others refuse to make any such promise.

The camp is quiet now. The railroad is not sufficiently yet equipped to handle all the ore and the mines are doing very little work. Hundreds of cars loaded with supplies for camp are strung along the railroad, partly owing to lack of rolling stock, and much, at present, to delays caused by disastrous washouts. For weeks there have been thunderstorms almost every afternoon. On August 14 one of these was followed by a rush of water a foot deep down the main street. A visit to the mines next day showed that this cloudburst had practically no effect underground, but it washed out the fills on the railroad for miles.

### Milling of Auriferous Ores in New Zealand.\*

NUMBER III.—CONCLUDED.

Written by H. A. GORDON.

A strong solution is first used, and after it has been on for two or three hours the cock in the pipe at the bottom of vat is slightly opened and the filtrate run into the zinc precipitating boxes. Afterwards a weak solution is used, and finally wash water, after which the gangue in the vat is removed by sluicing it out, if water is available; if not, it is removed by manual labor in the ordinary manner. At the Kauri Freehold Co.'s plant at Opitonui there were two sets of vats one above the other; the pulp was first treated in the top vat and then emptied into the other one below. This mixes up the ore and makes it more amenable to percolation, especially if it is mixed with slimes.

At some of the mills the cyanide precipitation vats discharge at the center of the bottom. The bottom of the vats is slightly conical, with a circular door in the center, which is opened from the outside, and when water is available the gangue is sluiced out. The vats at the Waihi Co.'s mill at Waihi are circular, made of kauri timber and held together with round iron hoops fastened with screw buckles; but all the most recent vats are made of steel plates  $\frac{1}{2}$  inch and  $\frac{3}{8}$  inch thick, with angle iron bars to strengthen them.

The cyanide solution treatment extracts from 80% to 95% of the gold in the ore, and from 30% to 45% of the silver. If the ore were roasted and chloridized, the chloride of silver would be as amenable to extraction as the gold; but the value of the silver lost is much less than the extra cost of roasting the ore.

In pulverizing ores, especially with a stamp mill, there is always a large percentage of slimes. Some classes of ore produce more than others. If it is mixed with a clay substance the percentage of slimes will be very great. It might be found that in using a 40-mesh screen 40% of crushed ore would go through an 80-mesh and 10% would be sufficiently fine to go through a 300-mesh, or even finer. When the gold occurs in minute particles through the matrix the finer it is pulverized the better it is for cyanide treatment, as far as getting the bullion in a soluble condition; but when in an extremely fine state it lies so close and compact when saturated with either water or cyanide solution that it forms an impervious bed that does not allow filtration to take place.

If the ore is coarsely pulverized where the bullion is in minute particles through it, the silica surrounding these particles prevents the metallic contents being subjected to the action of the cyanide solutions. Hence the necessity of crushing fine. There are two difficulties to overcome—(1) to pulverize the ore so that the whole of its metallic contents is left free from silica or other matrix; (2) to get the slimy ore in such a condition that the whole of the bullion it contains is easily made soluble, and when in solution to extract the metallic substances. The latter has been the great difficulty the millman has in the past had to contend with. The slimy ore set so compact in the vats that it formed an impervious bed through which a powerful vacuum pump could not extract the solutions. Several devices were tried to get over this difficulty, and at present the most successful is by agitation and forcing the agitated pulp—which consists of one part of slimes to about two or even three parts of solution—by compressed air of about

sixty pounds to the square inch, or by force pumps, into filter presses and through the filter cloths with which these presses are provided. The liquor coming through these cloths is quite clear and is run into the zinc precipitation boxes. These filter presses were first introduced by a firm of engineers in Hamburg, who constructed a large plant for Hannan's Brown Hill Co. in Western Australia. Since then several plants have been erected, two of which are in New Zealand—one at the Waihi Co.'s Waikino mill and one at the Kauri Freehold Co.'s mill at Opitonui.

The agitators are circular vats of from 18 to 20 feet in diameter and from 5 to 8 feet in depth, having a shaft with arms revolving inside. At some of the mills where filter presses are not used, as, for instance, the Waitekauri Extended Co.'s mill at Maratoto, the crushed ore passes through a 40-mesh screen and over amalgamating tables into a spitkasten. The coarse sands from the lower portions of the pyramidal section go into the sand vats to be treated with cyanide solutions in the ordinary manner, while the overflow from the spitkasten is run in on one side of the slime-agitating vat and the clarified water out at the other. When there is a sufficient quantity of slimes in the vat the overflow from the spitkasten is run into another agitating vat, the slimes in the full one being allowed to settle, after which the water is drained off by a siphon hose until the slimes form about 50% of the bulk in the vat. The agitators are then set to work. They consist of a central revolving shaft fixed so that it can be lowered or raised as required. On this shaft there are two parallel arms which come within 4 inches of the inside perimeter of the vat. These arms are about 3 feet apart vertically, and have a series of holes bored about 6 inches apart horizontally, through which a piece of damaged wire rope  $2\frac{1}{2}$  inches in circumference is rove, the bottom ends frayed out so as to act like a broom on the bottom of the agitating vat. The lower arms when down come within 9 inches of the bottom. When the slime vat is full, and the necessary quantity of cyanide solution on, the agitators are started and agitation carried on for about three hours with a depth of about 3 feet 6 inches of pulp in the vat. The solution used up to this time contains 0.16% KCy; a further quantity is then pumped up from the strongest solution sump until the vat is filled to within 6 inches of the top. The agitation is then continued for about two hours, when the agitators are raised and the slimes allowed to settle. It may be stated that about fourteen pounds of lime to the ton of dry slimes is added on the starting of the agitators. This has not only the effect of neutralizing the free acid in the ore, but also assists in a more rapid settlement of the slimes. On the settlement of the slimes the cyanide liquor is drawn off by a hose siphon into the solution pipe leading to the zinc precipitating boxes. The writer is of opinion that this system has the defect of slightly muddy liquor being at times carried into the zinc extractors, and that the cyanide liquor ought to be drawn off from the agitating vat into a long settlement vat, the liquor being run in at one end and drawn off at the other, thus allowing a better settlement of the slimes. Several washes are required to get the cyanide solution out of the slimes, the whole of which are put through the zinc extractors. After drawing off the first solution additional lime is sometimes used to effect more rapid settlement in the different washes. The rate of flow through the extractors is regulated to about 440 gallons of solution to every cubic foot of zinc in the zinc precipitating boxes. The loss in cyanide by this process is said to be about three-fourth pound per ton of dry slimes.

Before commencing to clear up the precipitating boxes water is passed through them for some time to get the zinc free from most of the cyanide solution; the zinc slimes are then allowed to pass into the slime launder and run into the vacuum filter, which has a cloth fastened to the sides. The zinc is washed in a box with a false bottom on which rests a wire tray made of 30 mesh. This prevents any of the coarse particles of zinc being carried away with the slimes. The cleanup is commenced at the top compartment, and each compartment is cleaned out one after another until the bottom end is reached. There are generally twelve compartments, having a zinc tray in each of the precipitating boxes. The vacuum pump is kept going until the slimes are as clear of moisture as possible. The slimes are then removed and the cloth in the filter chamber burned.

The slimes are now put into an oxidizing furnace, care being taken not to heat it too quickly. The roasting process takes about three hours, the temperature never exceeding a dull heat. When the volatilization of the zinc is complete, which one can generally tell by the appearance of the slimes and by the absence of any fumes arising when stirred, the slimes are allowed to cool, and, if clean, will contain from 50% to 60% of bullion.

The slimes are now placed in a plumbago crucible and melted along with the necessary flux. To every five pounds of slimes is added about twenty-five pounds borax glass and eight pounds carbonate of soda. The heat is at first carried on at a low temperature and gradually raised until the whole contents are in a perfectly fluid state, the slag ladled off and the metallic contents poured into a bullion mould.

### An Arizona Coal Field.

The Deer Creek coal fields of Arizona was studied during the season of 1903 by M. R. Campbell of the United States Geological Survey. The results of his investigations are embodied in a paper contained in the Survey's recent bulletin (No. 225), "Contributions to Economic Geology, 1903." Although the quality of the Deer creek coal is inferior to that of coals of many other fields, it has particular economic importance, as the field is situated in a timberless and arid portion of the country, in the center of a great copper-producing territory which is comparatively rich also in deposits of gold and silver. The great mining centers of Bisbee, Globe, Clifton and Morenci are the hope of this region. The local value of this coal is, therefore, considerably beyond that which is indicated by its chemical analysis.

Mr. Campbell finds that there are two important beds of coal that extend throughout the larger part of this basin. These beds are thin, ranging probably from 24 to 30 inches in thickness, but this is within the limits of workable coal. The tonnage of the field, based upon an estimate of 24 inches of coal throughout a basin 3 by 10 miles in extent, is about 60,000,000 tons. Probably 50% of this may be available.

The coal is fairly well disposed for mining, except where it is subject to local disturbances and where it has been cut by igneous dikes. These disturbances are usually apparent at the surface and may be avoided in locating commercial mines.

The coal is of two qualities. The first is a hard, block coal, which is adapted to transportation and commercial use, and may also be manufactured into coke. The second grade is a soft, badly crushed coal, which carries a heavy percentage of ash. It is doubtful if it can be marketed for general purposes. It carries, however, a large percentage of volatile matter, and may be manufactured into gas and the gas piped to the place of consumption, or it may be used to generate electricity in the field and the power carried then by wire to the place where it is needed. The first plan seems the better one, as the modern methods of manufacturing producer or water gas permit the utilization of the entire fuel value of the coal, an economy that would be impossible if the coal were employed in generating electricity. This bulletin is published for gratuitous distribution.

### Electric Power for Colorado.

A company was organized some time ago for the purpose of furnishing cheap electric power to southwestern Colorado, says Electricity. The undertaking involves a rather novel engineering feat. Two or three rivers are to be diverted to canals, which will feed an immense reservoir. From this reservoir the water will be carried through another canal and dropped through great pipes over the edge of a precipice 1000 feet high. The power house in which the current will be generated will be situated at the foot of the precipice. Ultimately it will have a capacity of about 40,000 horse power.

The site of the power house is about 24 miles from Silverton.

The initial cost of the undertaking, it is claimed, will approximate \$1,000,000, while the ultimate plan will involve an expenditure of about \$3,000,000. When the project is completed it is expected to revolutionize things in southern Colorado. With an abundant supply of cheap power many enterprises can be carried through successfully which hitherto have been blocked by the high cost of power when obtained from steam. From the power house at the foot of the precipice current will be carried to the surrounding country. If the results come up to expectations a second power house will be established a few miles to the south.

The generators will be of the three-phase type and will operate at 300 revolutions per minute. The current will be transmitted at a pressure of 50,000 volts and will be transformed down at the towns and mining centers to whatever voltage is required.

Surveys have been completed for the rights of way for the transmission lines, which will reach all of the principal mining sections in the San Juan district. These lines will extend into San Juan, Ouray, Hinsdale, La Plata and Montezuma counties. In addition to mining purposes, the company expects to furnish current for lighting all the principal towns in the district, and also to the large smelter of the American Smelting & Refining Co. at Durango.

An unusual mining risk is reported to have been taken by a New York company which recently bought the sulphur deposits in the crater of the volcano Popocatepetl in Mexico. The great volcano, although at present quiescent, still gives abundant evidence that the internal fires are only slumbering and not by any means extinct, there being numerous vents from which pour scalding water, great volumes of steam and hot mud. The volcano may become active again at a moment's notice, when mining would cease indefinitely. It is said to be the intention of the new owners of the volcanic mountain to build a cog-railroad from a point on the lower slope of the mountain to the rim of the crater to handle the brimstone.

\*Abstract from Trans. Australasian Inst. Min. Engrs.

# Geology of the Treadwell Ore Deposits, Douglas Island, Alaska.\*

Written by ARTHUR C. SPENCER.

The object of the following paper is a description of the Treadwell gold deposits in their geological aspects, quite apart from any consideration of the economical methods of mining and milling which have been developed and successfully applied to the working of ores having an average value of little over \$2 per ton. The studies upon which it is based were made in the course of a general official survey of the Juneau gold belt during the summer of 1903, under

miles to the northwest, and Sitka about the same distance in a southwesterly direction.

The four mines of the Treadwell group are located near the inland shore of Douglas island. From the Ready Bullion mine (Fig. 1), which is the most southeasterly one, it is 3000 feet to the nearest workings of the Alaska-Mexican mine, and the intervening ground is supposed to be practically barren. The Mexican workings extend, however, almost to those of the Seven Hundred Foot property, and the latter connect at several levels with the tunnels of the Alaska Treadwell mine, showing an almost continuously developed ore body for a distance of about 3500 feet. Although the workings have revealed several separate ore bodies, and certain distinctions are made in this character and occurrence of the ores,

and Triassic strata, and Dawson regarded the slates occurring near Juneau as equivalent to the Triassic part of the series. Fossils discovered during the field season of 1903 now show that at least part of the stratified rocks of the Juneau region are of Paleozoic age.

The strike of the stratification, and of the most omnipresent secondary schistosity, and also the courses of nearly all intrusive contacts, vary between north 20° west and north 40° west. The prevailing dips are away from the sea, that is, toward the northeast, the inclination of the rocks varying, as a rule, from 20° to 70°, but with local instances of vertical or slightly overturned position.

The attitude of the formations occurring in this mainland portion of southeastern Alaska points to

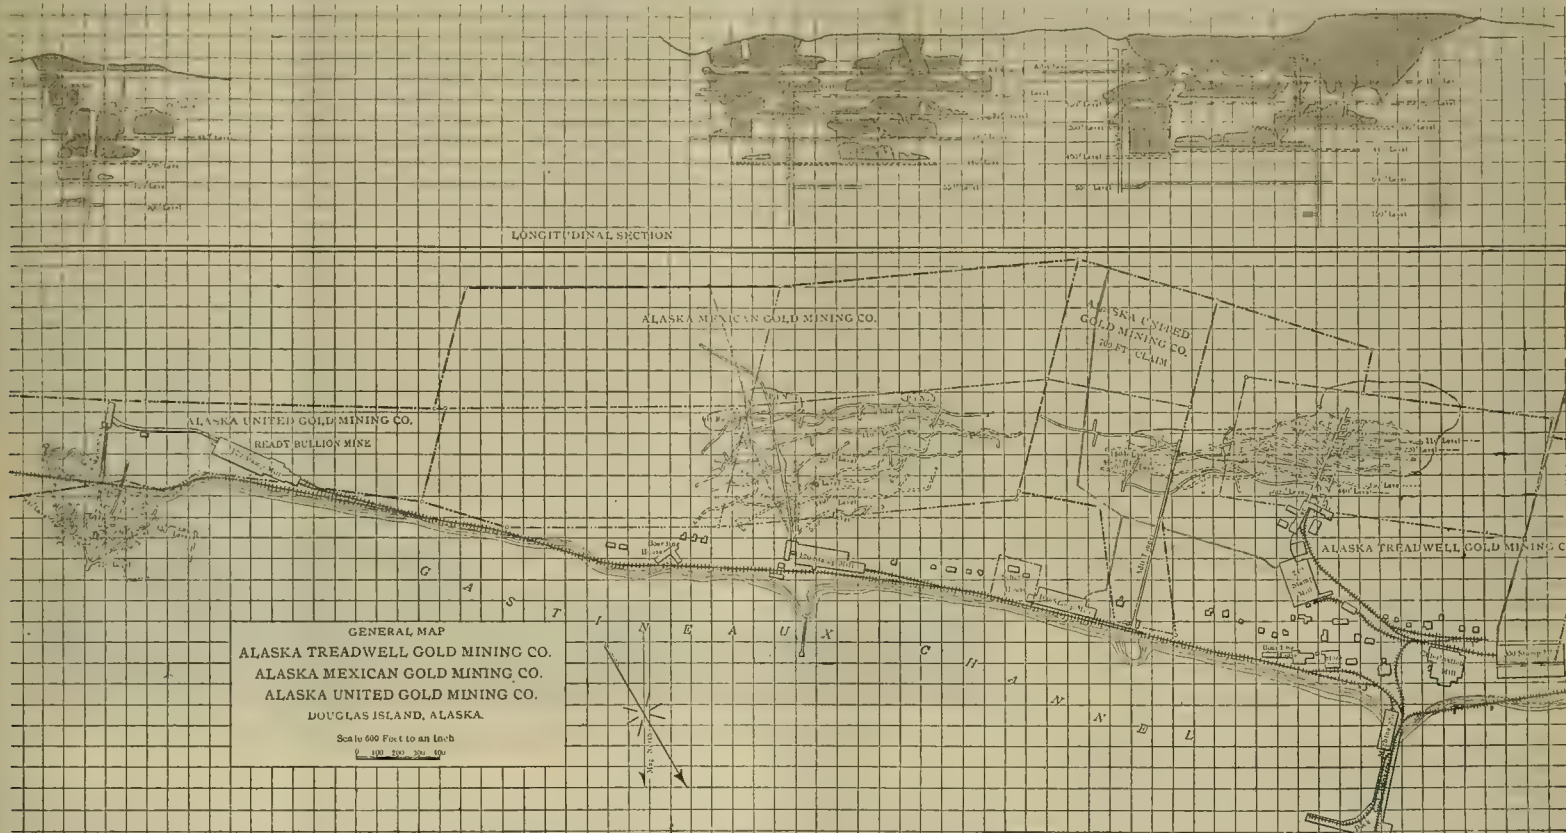

Fig. 1.

Fig. 2

Fig. 4.—Geological Section Douglas Island and Mainland Near Juneau, Alaska.

the instructions of A. H. Brooks, geologist in charge of the division of Alaskan mineral resources, United States Geological Survey.

Douglas island, upon which these mines are situated, is one of the smaller islands of the Alexander archipelago, separated from the mainland of southeastern Alaska by a narrow fiord known as Gastineau channel. On the island two towns, Douglas and Treadwell, owe their 2000 inhabitants to the activity of the mining operations, while Juneau, with its somewhat greater population, lies on the adjacent mainland, about 2.5 miles northwest of Treadwell. The distance by steamer from Seattle, Wash., to Juneau slightly exceeds 900 miles, while Skagway, the terminus of the Yukon & White Pass Railroad, lies 95

the mines are all located on the same lead, and the ore material is practically of one nature and of identical origin throughout. As a whole, therefore, the deposits may be conveniently designated under the name of the first discovered and largest mine.

GEOLOGY OF THE REGION. — South-eastern Alaska, sometimes called the Panhandle, is the portion of the Territory lying between the Pacific ocean and British Columbia. It comprises the islands of the Alexander archipelago and a mainland strip about 30 miles wide. In this relatively narrow mountainous belt the geological formations are disposed in bands parallel with the general northwest trend of the mainland coast and the longer dimensions of the many islands which dot the archipelago. On the mainland three easily distinguishable groups of rocks can be traced from Windham bay on the south to Berners bay,

simple structure like monoclinical tilting, and though this would require a very thick succession of sedimentary rocks, no duplication of beds, either upon a small or grand scale, has yet been discovered to suggest the existence of a system of isoclinal folds or of a series of block faults, either of which would greatly reduce the apparent thickness.

The general character of the topography near

Fig. 3.

Juneau is shown in the sketch map, Fig. 2. The distribution of the formations in the same area is given in Fig. 3, while the cross-section (Fig. 4) drawn through Douglas island and the adjacent mainland illustrates the general structural relations of the formations.

The geology of the Juneau region and of southeastern Alaska as a whole resembles, in many ways, that of the gold belt of California. The rocks of both regions are in large part of identical character, and some of them correspond in age and in the nature of their metamorphism. There is also a marked similarity in the occurrence of the gold veins and in the general effects of mineralization, and some of the broader facts suggest that the dates of vein and ore deposition also correspond closely, though more

\* Abstract Am. Inst. Min. Engs.

extended and further detailed studies must be made before definite proof of this can be obtained.

**INTRUSIVE ROCKS OF THE COAST RANGE.**—The main mass of the mountainous belt from 50 to 80 miles wide, which separates the waters of the Pacific from the plateau region of British Columbia, is composed of coarse-grained intrusive rocks, which have been designated the Coast range granites by Dr. Dawson of the Canadian Geological Survey. In the Juneau belt true granite rarely occurs, and while the black and white granular rocks of the region often pass under this designation and are undoubtedly part of, or closely connected with, the intrusives of the whole Coast range, as a rule they are really diorites or related rocks, many of them being similar in composition and appearance to the diorites and granodiorites of the Sierra Nevada in California.

Within the diorite zone of the Coast range there are various minor bands of included metamorphic rocks similar to those which form its bounding formations, and there are also some basic dikes of later origin than the diorites.

Along the border of the main diorite there are found outlying arms, usually running parallel with the structure of the enclosing rocks, but sometimes slightly crosscutting. Occasionally, also, there are outlying stock-like intrusions which are not greatly lengthened in the direction of the general trend of the country. Some of these outside masses are connected with the main area by surface outcrops, while others are not visibly joined to the central mass.

Within an area of about 50 square miles adjacent to Juneau the diorites show several distinct though related types, and these range from rocks composed almost entirely of hornblende to mica diorite, quartz diorite and granodiorite. In the Coast range near Skagway true granites are found associated with the more common diorites.

The intrusive rocks in which the ore of the Treadwell mines occur is one of the extreme differentiation phases of the diorite. It has been described by Dr. Becker as sodium-syenite, or albite-diorite.

The areal relations of the main diorite and the outlying masses in the vicinity of Juneau are shown in the accompanying sketch map, Fig. 3. Each separate intrusion appears in the field to have a distinct mineralogical composition.

(TO BE CONTINUED.)

## New Carbon Compound.

At a recent meeting of the Academy of Sciences of France in Paris, H. Moissan presented a paper concerning the preparation and characteristics of a new carbon compound containing molybdenum. This compound is obtained by heating charcoal with melted molybdenum and aluminum in an electric furnace. The resultant metallic mass is treated with a concentrated solution of potash, and needles of well-defined crystals of the new carbon compound are obtained. The substance is very hard, is scarcely attacked by acids other than nitric, and is not decomposed by water or steam at a temperature below 600° C. It resembles the carburet of tungsten, already known, which is not surprising, as the metals tungsten and molybdenum are much alike. It is thought that this new compound may play a role in molybdenum steels. The method of preparation shows that even at a rather high temperature (that of boiling aluminum) a molybdenum compound is obtained which contains twice as much carbon as the compounds formed at the highest heat obtainable in the electric furnace.

THE general inclination of decisions in the courts is toward a vein or zone of mineralization, and yet large mines have been opened on bodies of "mineral" which were almost indistinguishable from the surrounding barren country rock. There is, however, a great difference between a miner being justified in spending his time and money in the development of a location and in being willing to do so, and the courts are generally satisfied to accept the substantial evidence of the locator's faith and judgment by the work performed. There are many examples of work having been done on mines which were commercially worthless at the time the work was done, but which subsequently became valuable by reason of material change in conditions, cheapening of transportation or rise in price of the mineral contained in the rock.

In 1903 the production of manganese ore in the United States was only 2825 tons, though 146,056 tons were imported. There is abundance of manganese in the Western States, but the low price which the ore brings in Eastern steel markets—less than \$9 per ton—renders the mining of Western ores unprofitable. There are large deposits of manganese known in Montana, Nevada, Utah and California, but these deposits are not at present available for commercial purposes. In Colorado, in the Lake Superior iron region, in Virginia, and a few other Eastern localities, there are large amounts of manganese iron ores mined, but the manganese is incidental.

ALTHOUGH cinnabar occurs in rocks of many kinds and of many geological ages, all of the large and important deposits throughout the world are found at or near the contact of sandstone and serpentine.

## The Desert Dry Lakes of California.

NUMBER VII.

Written for the MINING AND SCIENTIFIC PRESS by  
G. E. BAILEY, E. M.

Increased consumption and lower prices have been met by improvements in the processes, until to-day low-grade muds carrying only 7% of boric acid are found profitable. In speaking of the borax works of W. T. Bartlett at Daggett, San Bernardino county, Cal., Bulletin No. 24, in calling attention to the working of low-grade borax muds, says:

The Western Mineral Company's works are located a short distance west of Marion, on the flat. Their character is well shown in the accompanying engraving. The works consist of tanks for boiling the crude borates with sulphur and vats for evaporating the solutions and crystallizing the boric acid. W. T. Bartlett, the owner and manager, is one of the pioneers in this district in the manufacture of boric acid, and it is due to his ability and indomitable perseverance that the problems connected with the working of low-grade borax muds have been solved. The ore used at these works is a low-grade bluish-black, gray or red clayish mud, that looks something like a fine-grained shale or sandstone. It is evidently a portion of heavily-bedded deep-water deposits, carrying from 7% to 20% boric acid.

Since Bulletin No. 24 was written, the processes

what thirty years ago was an expensive luxury, is to-day so cheap that it is an ordinary household adjunct. What is procured at an outlay of so much physical discomfort and at so great a cost in money is one of our greatest labor-saving and health-preserving agents."—E. S. Marshall, in *The Traveller*.

"Borax finds many and varied uses. It is employed as a flux in welding metals and is an important ingredient in the enamel used on iron ware and in various glazes for china, in which its property of forming fusible salts with many metallic oxides is of great service. It is used also in dyeing and is of service in the manufacture of many drugs and chemicals. It is employed in soap making, while its varied domestic uses are well known. These uses are constantly extending, and there is no prospect that the demand will diminish in the future. \* \* \* \* \*

Commercial borax is a white crystalline substance or powder, with a sweetish taste, and of manifold uses. One of the chief employments is in welding and in other metallurgical operations, its office being to afford a convenient flux. It forms fusible salts with almost all metallic oxides. It is the basis of enamel so much applied to iron utensils, glazed brick and much china earthenware and tiling. It dissolves the glutinous matter from the raw silk and aids the dyer as a mordant. It is employed in the laundry with starch to give glossy linen. The meat packers use

A Pyramid of Salt Ready for Market, Alvarado Marshes, Alameda County, Cal.

Bartlett's Borax Works, on a Dry Lake South of Calico, San Bernardino County, Cal.

have been so far improved that muds carrying only 5% are sent to the vats. It was only a few years ago that only material running over 20% boric acid could be used profitably. This, by improved technology, has been reduced to 5% raw material. When the by-products are utilized, this percentage will again be lowered. It was only a few years ago that miners sneered at low-grade gold ores, and predicted that they would not be worked for "ages to come;" but the success of such mines as the Homestake of the Black Hills, Dakota, and the Treadwell of Alaska have made large bodies of low-grade gold ores the preferred choice of capitalists. A few years ago "rebellious ores" were condemned. To-day the cyanide process and improved concentrating and smelting have set the prospector hunting for this class. Those who think that the value of the dry lakes consists wholly in the richer crusts of borax or soda as worked at first, should study the history of the borax, brief as it is, and they should remember the progress in gold mining. A little study and a little reflection will convince the most skeptical that "history will again repeat itself," and in time every foot of the muds of the dry lakes will be worked to extract their rare, unique and valuable salines.

**USES OF BORAX.**—"It may be interesting while discussing the history of borax to note that over fifty classes of artisans use this salt in some of its forms in the industries which they follow. In this connection, also, it is worthy of remark that while almost the entire home product is consumed in this country, the price has decreased in an astonishing ratio, and thus,

over 1000 tons yearly as an antiseptic, while in soap it is very serviceable in hard waters. A large number of drugs contain it and its uses are many and annually increasing. \* \* \* \* \*

The packing industries are now using larger quantities of borax than ever; tanners have been induced to use it in softening the water for the soaks, cleansing and preserving the hides and skins and preventing the withdrawing of their gelatine, and the household use is largely increased."—Mineral Industries.

The following are some of the more common uses of borax: It is extensively used in assaying, in the metallurgy of ores and in the smelting of copper, and it is said to be an excellent insecticide, being especially obnoxious to cockroaches. Borax has the property of dissolving the metallic oxides, which makes it useful in soldering metals. It renders the surface to be joined clean, so that the solder "runs" and fills the joint between them. World-wide attention has been called to the use of borax in preserving meats, the first use being in 1878, when Smith Bros. sold 20,000 pounds of borax to Chicago consumers, to be used in preserving and canning beef. Its use during the wars in Cuba and the Philippines was so extensive as to lead to national investigations of its effect. Germany made a long series of tests, and the United States is now making an elaborate series of tests of the effect of borax upon the human system by actual experiment upon a number of young men. There is no question but that borax is a great preserver of meat and milk, and these tests show the intense interest taken in the subject and a full appre-

ciation of the value of such a preservative.

Boric acid is used in the manufacture of "strass," which is the base of artificial gems. It is used as a mordant in calico printing and in dyeing, and as a substitute for soap in dissolving gum out of silk. It is used in the manufacture of "Guignet green," a beautiful pigment used in calico printing which is really a borate of chromium. A varnish made by boiling one part of borax with five parts of shellac is used in stiffening hats. With caseine borax forms a substance which is used as a substitute for gum. A solution of borax in water may be mixed with linseed oil and used for cheap painting. The borate of manganese has been found to be a most excellent drier for paints, oils and varnishes and is coming into general use in the arts for that purpose. As manganese and borax are abundant and cheap in California, there seems to be no reason why it should not be extensively manufactured in that state.

The use of borax and various borates in chemistry would make a longer list than that of its use in medicine; and in metallurgy its use is large and steadily increasing. It will be noted that the use of borax is mainly in the household and in household articles. In fact, its range of usefulness is far wider and greater than that of salt. This fact alone, without taking into consideration its use in the arts and sciences, should be a warning to the effect that the demands of the future generations will be enormous—so enormous as to be difficult to realize now; and that it is the duty of those in authority to see that every step is taken necessary to conserve the natural supplies which are in the dry lakes of the desert on each side of the line that separates California and Nevada; and which are the only natural deposits in North America; and which are the main deposits of the civilized world.

(TO BE CONTINUED.)

## The Genesis of the Diamond.\*

Written by GARDNER F. WILLIAMS.

Chemically, the diamond is composed of the element carbon in its pure crystallized state. The diamond crystallizes in the isometric system, and the most common forms are the octahedron and dodecahedron, while the (24-sided) tetrakis-hexahedron is not uncommon. Cube diamonds with beveled edges representing the combination  $\infty 0 \infty$  and  $\infty 02$  are occasionally

found. It is not always possible to determine the source of each individual diamond, for similar stones are occasionally found in different mines; but these are exceptions to the rule. There is a difference in the luster, shape or crystalline form of the diamonds from the various mines that gives each mine some distinctive characteristic. In one mine nearly all the crystals are sharp-edged octahedrons, while in another dodecahedrons with rounded faces predominate. One might give no end of peculiarities of the diamonds from the various mines; but it will suffice for the purposes of this paper to state the fact that such distinctive characteristics do occur.

From this observation it may be concluded that the diamonds in the mines of the Kimberley district, which occupies a small area (see Fig. 1), did not have a common origin.

The diamond is the most impenetrable of all known substances, and will scratch any other stone, or the hardest steel. It is a very strong reflector of light, and refracts incident rays more than any other substance except crocoite.

While crocoite is the only mineral that exceeds the dispersive power of diamond to dissolve white light into rainbow tints, the powers of reflection, refraction and dispersion possessed by the diamond are unmatched. It is highly phosphorescent, and even the blackest diamond is transparent to the X-ray. It is insoluble in all acids, and can easily be burned and converted into carbon dioxide. However, it is noteworthy that the diamond is a non-conductor of electricity, while graphite and charcoal, substances so closely allied to it in chemical composition, are excellent electrical conductors. By the application of friction, the diamond can be positively electrified, but it very soon loses its electricity. The diamond is easily cleaved in planes parallel to the octahedral faces. Pieces may be easily broken from the facets of a cut stone by striking it with a hard substance.

So much, it may be claimed, is known about the physical properties of the diamond, but how the diamond has been formed or crystallized is a question still debated by scientists.

Upon the information at hand, it may be assumed that all diamonds found prior to the discovery of the Kimberley pipes, or craters, came from alluvial deposits, and had been washed down by the disintegration of the original matrix. Such was the character of the formation in which the noted diamonds of India were found, which is described as a layer of broken sandstone, quartz, jasper, flint and granite, interspersed with masses of calcareous conglomerate, the whole being about 20 feet thick and covered with a few feet of black "cotton soil." Here were the great mines of Gani-Coulour and Gani-Partaal, whence came the Koh-i-noor (793 carats), the Great Mogul (787.5 carats), the Regent (410 carats), and many other historical stones.

The Indian mines were noted more for the size and purity than for the quantity of the gems they produced. There had been no considerable production of diamonds outside of the Deccan fields until the discovery of diamonds in Brazil in the year 1728. Here in the province of Minas Geraes rich beds were opened in an alluvial deposit of clay, quartz pebbles and sand charged with iron oxide. In many places the diamond-bearing strata were buried under 30 feet or more of alluvial detritus. These deposits occurred along the rivers, up the ravines to the ridges and plateaus, where conglomerate beds were reached from which the deposits in the rivers had been washed. The conglomerate was chiefly itacolumite, a micaceous sandstone. The sandstone being a fragmental sedimentary rock was not the original matrix of the diamond. Probably, when the sandstone was being formed, the diamonds were washed down with the detritus, and became imbedded in it.

Diamonds have also been found in Borneo, New South Wales, British Guiana, in the gold deposits of the Ural mountains, Australia and California, along the Vaal river in South Africa, and in many other localities, but always in alluvial deposits.

Before the discovery of the mines at Jagersfontein and Kimberley, which occurred between August, 1870, and July, 1871, there is no record that diamonds had been discovered in volcanic pipes or craters—their occurrence had

or else, that a diamond-bearing dike penetrated the conglomerate strata, and its contents were mined and sent to the mill along with the gold ore. The finding of these diamonds, as above described, is well authenticated. The diamonds were of a greenish color. It is a well-known fact that a dike, carrying diamonds in small quantities, and situate only about 50 miles from Klerksdorp, was prospected a few years ago. This tends to bear out the dike theory.

Coming now to the occurrence of diamonds at Kimberley, I may preface my remarks by saying that my experience with the mines at Kimberley dates back nearly twenty years, seventeen of which have been passed in the management of them.

The diamonds occur in a rock commonly known as "blue ground," filling the craters of extinct volcanoes. This rock was described by Professor H. C. Lewis as a porphyritic volcanic peridotite of basaltic structure, which he named "Kimberlite." It must be designated as a breccia. There is no doubt that the blue ground is of volcanic origin, and was forced up from below; it consists of olivine with fragments of other rocks. I am of the opinion that the craters were filled by aqueous rather than igneous agencies, possibly something in the nature of mud volcanoes.

It is a noteworthy fact that all the craters were filled just even with the surface of the surrounding country. Would this have been the case if the pipes were of igneous origin? I think not.

It may be claimed that the surface of the country, as it existed when the craters were filled with the diamond-bearing breccia, was not the same as at present, but that has been denuded or washed away, or has been removed by glacial action. There is, however, not the least particle of evidence to bear out such a contention. If the country rock and diamond-bearing ground had become decomposed and then washed away, then diamonds would have been found in the "wash," or in ravines and water courses in the vicinity of the mines. Such is not the case; no diamonds have been found in alluvial soil nearer than the Vaal river, some 20 miles distant; and these diamonds are totally different in character than the "mine" stones.

The Vaal river diamonds did not have their origin in the Kimberley mines. The occurrence of well-rounded and, at times, polished boulders and small pieces of rock, is proof that other than igneous action was necessary to produce them.

Professor Bonney says that "the idea that they have been rounded by a sort of cup-and-ball game played by a volcano may be dismissed as practically impossible." He refers to the Dwyka conglomerate bed as a possible source of these boulders. A conglomerate bed exists in the Kimberley strata between the shale and the melaphyre (or olivine-diorite of Stelzner), and is between 300 and 400 feet below the surface. This conglomerate is from 3 to 10 feet thick, as determined in the various shafts in the Kimberley mines. The rounded stones in the mines did not come from this bed, and are wholly unlike the stones in the conglomerate. Personally, I do not favor the cup-and-ball theory, and would not give it a second thought were it not for the fact that the diamond-bearing ground as it is found in the mines shows such a mixture with the country rock that some process of nature must have stirred up and thoroughly mixed the contents of these great craters. I cannot comprehend how this result could have been brought about in an igneous volcano. There would have been overflows of the diamond-bearing rock which would have been found in the vicinity of the mines. No such deposits have been found, and I do not believe that they exist.

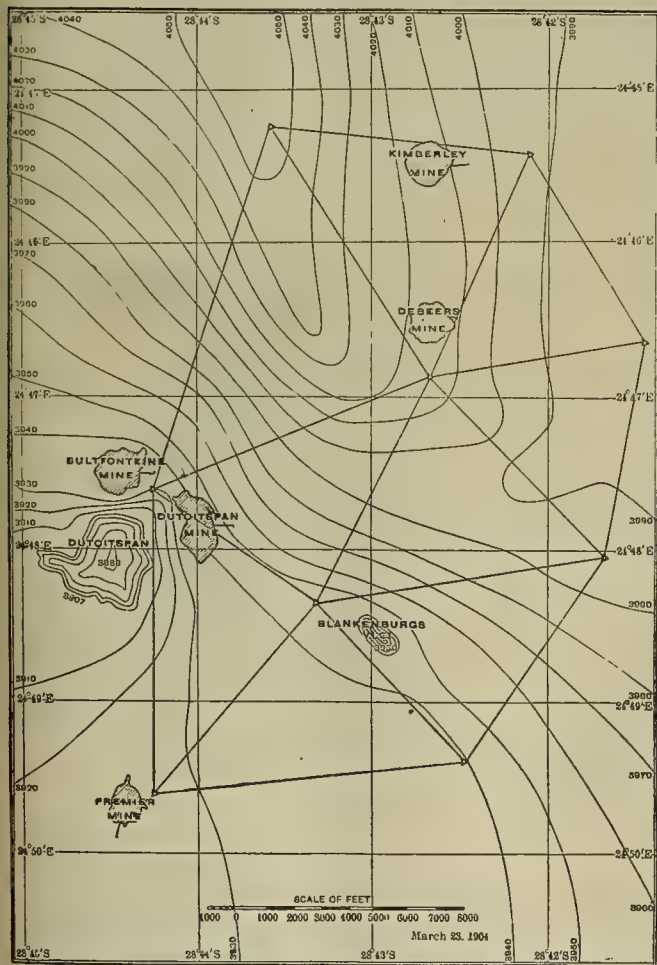

It is much easier to reconcile existing conditions to the aqueous or mud volcano theory (especially if the mud was accompanied by large quantities of gases which on nearing the surface escaped while the mud receded) than to an igneous theory.

There must have been innumerable eruptions and explosions to account for the inclusion of the surface shales and fragments of the country rock in the diamond-bearing peridotite. The frequent occurrence of these eruptions would, in a measure, solve the problem as to the manner in which the fragments of rocks varying in size from pebbles to boulders, some with polished surfaces, became, as it were, water worn.

The evidence of the movement of the diamond-bearing rock after solidifying is indicated by the slickensides and striated surfaces of the country rocks at their junctions or contacts with kimberlite. Large sheets of calcite are frequently found at the junction of these rocks, which have taken the form of the striae. Beautiful calcite crystals and transparent pieces of doubly refracting, or Iceland spar, are of frequent occurrence.

(TO BE CONTINUED.)

THERE is a growing tendency to equip mines with electricity, where the means of motive power can be cheaply applied. One of the most recent installations of this character is at the Wolverine copper mines in the Lake Superior region, where an electric plant has been installed at a cost of \$40,000. Its chief use will be in underground haulage.

Diamond Mines, Kimberly District, South Africa.

found in the Bultfontein and Premier (Wesseltown) mines at Kimberley, South Africa. The diamonds from various mines have distinctive forms of crystallization, or variations of the same forms, so characteristic that those familiar with South African diamond mines and their products can determine positively from which mine any given parcel of dia-

monds has been obtained.

A few years ago diamonds were found in the battery mortar of a mill at Klerksdorp in the Transvaal, which was crushing gold ore from a conglomerate reef, similar to the Witwatersrand reef. This remarkable occurrence of diamonds may be explained in two ways: Either that, during the formation of these conglomerate beds, the wash from a diamond-bearing pipe or dike was mixed with the detritus;

## Crushing in Cyanide Solution as Carried on in the Black Hills, S. D.\*

NUMBER III.

Written by C. H. FULTON.

THE SEPARATION OF THE SANDS FROM THE SLIMES BY MEANS OF CONE CLASSIFIERS—This is now done in the district almost entirely by means of simple sheet iron cones. These cones are the outer cones of ordinary hydraulic classifiers, the inner cones having been removed. It may be stated at the outset that the problem of removing the sands from the slimes when crushing in cyanide solution with considerable lime is a more difficult problem than when crushing in water with practically no lime. The lime causes much trouble—first, by its coagulating effect on the slimes, causing them to settle with the sands and coat sand particles with slimes, and, second, by causing the formation of an excessive amount of froth or foam, which is certainly a great nuisance about the mill. Figs. 3 and 4 show the general arrangement of the classifying cones.

The batteries discharge their sludge by launder

FIG. 3.

FIG. 4.

into a central sump, from which it is raised to the cones. The raising pump at three of the mills is a spiral sand pump, and at one of the mills a centrifugal pump. For the raising of the battery sludge, consisting of sands and slimes, the spiral pump is preferred to a centrifugal on account of less wear. For the transference of slimes, and for their agitation, a centrifugal pump is generally used. The usual size of the spiral sand pump employed is the 54 by 10 inches. These pumps are run at nineteen to twenty revolutions per minute, raising the pulp 15 to 20 feet. Twenty feet is about the practical maximum lift of these pumps, and for greater lifts they are placed tandem. A pump of the above size will readily handle from 350 to 450 tons of sludge per day.

The discharge of these sand pumps is intermittent, so that at all of the mills a distributor box is used to steady the flow and give a uniform feed to the cones. These distributing boxes have different forms at the various mills. At the Horseshoe mill a pyramidal box is used 4 by 4 feet in cross section at the top, the sides sloping at 60° to meet at a point. The inverted pyramid is topped by a box 12 inches high, through

which the two 4-inch pipes from the sand pumps enter. About 12 inches from the bottom of the pyramid four 3-inch pipes emerge, one at each side, which feed into four 50-inch cones. The distributor is placed centrally over the four cones, and as low as possible, so that the head under which the discharge takes place will be small. A screen placed in the distributor box serves to keep out foreign matter from the cones. At the Maitland mill a plate steel box 6 by 3 feet in cross section and 3 feet deep is used as a distributor. On one side, 21 inches from the top, two 5-inch pipes enter from the sand pumps and discharge upon an inclined screen. The two discharge pipes—5 inches in diameter—which feed the two 50-inch cones have their centers placed 4 inches above the bottom of the distributor box. As at the Horseshoe mill, the distributor is set as closely as possible to the cones. At the Dakota mill a similar box made of wood is used.

The upper cones are simple cones of sheet iron from 40 to 50 inches in diameter, having vertical sides at the top 12 inches high. The slope of the cones is 60°, ending in a 6-inch sorting column, which has a 2-inch discharge controlled by an iron cock. The charging pipe feeds at the center of the cone, just below the pulp level. In most of the mills the top cones are covered closely by either a wood or an iron cover to confine the foam. This has the disadvantage—not very serious—of preventing ready inspection of the cones.

The upper cones are practically simple settling cones. The sludge going to the cones contains from 14% to 19% of solids, of which 30% to 50% is slimes and the rest sands. Just what constitutes sands and slimes is somewhat difficult to define. It is generally accepted by the men in charge of the plants crushing siliceous ores that material finer than 150 mesh is a slime, and coarser than 150 mesh a sand, and classification is made largely on this basis. It has also been defined as that portion of the crushed ore that will make water muddy, sand, no matter how fine, settling practically at once, and not remaining suspended.

The overflow from the upper cones contains practically no sands, even very fine, and goes to the slimes tanks by the overflow launder. The sands discharged at the bottom of the cones contain from 20% to 35% of slimes and are distributed by a short box to the lower cones. These lower cones are of the same construction as the upper ones, but have introduced into the sorting column an upward current of cyanide solution, either battery solution or barren solution (solution that has been precipitated), but generally battery solution. This solution is introduced through a 2-inch pipe, with a cock to regulate the flow. The amount of solution introduced in this way amounts to from 60 to 80 tons per twenty-four hours for a 42 to 50-inch cone. These figures vary somewhat, those given representing the limits. The number of lower cones is always one-half that of the upper cones. The solution pipes entering the sorting column of the lower cones do not come directly from the stock tanks, but from a special box provided with an overflow at a definite height, so that the head of the entering solution is always constant.

The final sand discharge, containing 25% to 30% of solids and from 1% to 5% of slimes, goes to the Butters distributors over the sand vats, battery solution being added in the carrying launder so as to have five parts of solution to one part of sand. The mills endeavor to make a fairly close separation of sands from slimes in order to get a good leaching rate in the sand tanks, usually from 2.5 to 3.5 inches per hour, although at one plant it is but 1.5 to 1.75 inch per hour, and also to prevent trouble which the sands give in the slimes tanks, that of settling to the bottom and remaining there during the greater part of the treatment practically unacted upon.

(TO BE CONTINUED.)

## THE PROSPECTOR.

It is not the purpose of this column to give the assay value of samples sent for examination, nor to give analysis of ores or rocks of any kind, but simply to indicate in a general way the character of minerals and rocks, and to give such other information to prospectors and others as may be of practical value to them.

The rock specimens from Tombstone, Ariz., have been classified as: 1. Fragmental rock composed of grains of quartz, cemented by reddish mud, presumably of volcanic origin. 2. Altered limestone, in which has been developed much diopside. 3. Felsite, greenish in color, due to the presence of iron mineral of some description, presumably silicate. A small amount of very fine pyrite is also present.

THE Mount Lyell Mining & Railway Co. intends to try to treat some of the siliceous ores of the Lyell district by magnetic separation, says the Australasian. A series of experiments had been conducted by the owners of a magnetic separator, with a view to finding if it was possible to get the copper pyrites away from the gangue. No progress was made until

it was discovered that by subjecting the ore to a slight roast it became converted into magnetic pyrites. Continuous experiments were then carried on, and recoveries of over 90% were achieved. The problem is an exceedingly nice one, for the ore will have to be crushed fine, and it will have to be prevented from packing in the hopper, from which it is fed wet to the magnets. If the 100-ton plant does its work efficiently the destiny of the Mount Lyell field may be changed. The company intend to try the separator first on the South Tharsis and Royal Tharsis mines.

The rock samples from Table Rock, Sierra county, Cal., are identified as follows: No. 1, quartz coated in the seams with talc, iron sulphide (pyrite) in cubes; No. 2, decomposed vein material containing much iron oxide (limonite) with scales of secondary white silvery mica. It may contain gold; No. 3, a ferruginous dike rock much altered—iron oxide is hematite. May contain gold; No. 4, an ore (largely limonite and quartz), a few scales of mica similar to that in No. 2 present green patches of talc. The brown crystals are limonite from alteration of pyrite, probably gold bearing; No. 5, serpentine; No. 6, quartz rock containing much limonite, evidently from a vein; No. 7, a dolomitic mineral with some quartz and scales of mariposite. No. 6 is probably altered from a rock like No. 7. This rock is characteristic of some portions of the Mother Lode in California, notably in Mariposa and Tuolumne counties; No. 8, also a dolomitic rock, similar to No. 7, but containing no mariposite; No. 9, a quartzose talc schist, containing oxidized pyrite; may be gold bearing; No. 10 is very similar to No. 2; No. 11, quartz with iron oxide (limonite) and pyrite; may contain gold; No. 12, quartz with green scales of mariposite; also contains pyrite and gray copper, the latter in small crystals; No. 13 is the same as Nos. 6 and 7, containing both the unaltered and altered mineral; No. 14, quartz with considerable disseminated pyrite; No. 15, quartz with mariposite and pyrite; No. 16, an altered eruptive rock, probably greenstone; No. 17 is apparently also an altered dike rock. As these rocks are from the gold belt of California, it is probable that all may contain gold, and some of them look like payable rock.

The rocks from Matehula, San Luis Potosi, Mexico, are classed as follows: No. 1, a metamorphic rock consisting largely of garnet, silica, and calcium carbonate, apparently an altered limestone; No. 2, granite, with also some plagioclase feldspar; No. 3 same as No. 2, but somewhat fresher and contains a small amount of chalcopryite (copper-iron sulphide); No. 4, also the result of contact metamorphism, consists principally of garnet, and carries both iron and copper sulphides in small amount; No. 5, garnet, with a little quartz and about 3% or 4% copper in the form of chalcopryite; No. 6 is a metamorphic, schistose rock produced by crushing and shearing of the country rock (possibly the granite). It contains finely disseminated iron and copper sulphides.

The mineral samples from Stag, San Bernardino county, Cal., are calcium carbonate, and have the appearance of having been precipitated from calcareous springs.

The rock specimen from Mariposa county, Cal., is a much altered dike rock and belongs to the greenstones, though now stained brown by iron oxide. Rock of this kind is frequently found in the neighborhood of pocket mines in Mariposa county.

In securing assays and analysis on ores and minerals, where the presence of the rarer metals and minerals are suspected, great care should be taken to verify the report of these rare substances. For instance: An ordinary appearing ore apparently carrying pyrite and a little blackened iron sulphate, with quartz, but which is reported to contain "Black oxide of iron, arsenical iron, manganese, nickel, cobalt, bismuth, sulphur, magnetic iron, carbon, phosphorus, silica, lime, titanium, and other substances," may be looked upon with some suspicion, for it is more than possible that there has been a mistake made by some one, either by confusing with another sample or in the chemical determinations.

The rock samples from Mancos, Colo., are volcanic tuffs firmly consolidated.

The rock specimen from Liscum, Ariz., is pegmatite, a variety of granite. The constituents prominently visible are pink orthoclase, vitreous quartz, purple fluorite and small scales of white mica.

The rock specimens from A. E. R., Marysville, Mont., are: Norite, a rock composed largely of basic plagioclase and a rhombic pyroxene (in this instance hypersthene). This rock is not of wide occurrence, but is found at a number of localities in the United States.

The rocks from Olinghouse, Nev., are largely garnet, with quartz and iron oxide. A small amount of sulphide of iron is seen in the oxidized iron ore.

The rocks from Upper Cow creek, Shasta county, Cal., are various kinds of andesite, dacite, etc., tuff and other volcanic rocks.

\*Bulletin No. 7, South Dakota School of Mines.

# Mining and Metallurgical Patents.

PATENTS ISSUED SEPTEMBER 27, 1904.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

ORE WASHING OR CONCENTRATING MACHINE.—No. 771,107; E. A. Wall, Salt Lake City, Utah.

Ore concentrating machine or table adapted to receive actuating impulse from head end, in combination with operating rod or bar attached to head of table, buffer bar through which rod passes, spring on rod at inner side of buffer bar and buffer block secured to rod at outer side of buffer bar or timber to receive and resist impact of spring and suddenly stop forward movement of table at head end as it moves in direction of tail, and means for retracting operating rod against spring and suddenly releasing it.

CLASSIFYING OR SIZING APPARATUS.—No. 770,877; A. T. Winkler, Denver, Colo.

Combination with transversely inclined concentrating table of lineoleum-covered rifled plate, transversely inclined toward and hinged at upper edge of table, adjoining longitudinal screens secured to frame on plate, space between them and plate being divided into two compartments open at one end, suitable means for regulating discharge from compartments, screen located above and covering one of screens and part of adjoining one, projections extending above surface of screens, feed trough located above uppermost screen, means on concentrating table for directing various grades of ore, discharged onto it, toward upper edge of table, water trough located at upper edge of table and provided with discharge apertures and corresponding gates, and suitable means for varying inclination of rifled plate in relation to table.

APPARATUS FOR SEPARATING ORE.—No. 770,796; H. F. Campbell, Boston, Mass.

In a magnetic separator, a magnet; means, presenting unobstructed surface at due distance below magnet, for supporting and conveying material under and past magnet and through uninterrupted field of such magnet, and to pass it, spread in film of uniform thickness on surface beneath magnet, and means for causing particles of ore to be mechanically agitated under magnet in direction other than that of travel of ore.

SEPARATION OF MINERAL SUBSTANCES BY MEANS OF THE SELECTIVE ACTION OF OIL.—No. 771,075; C. Kendall, Upper Norwood, England.

Process for treatment of finely divided material for separation of graphitic substance contained therein from associated rocky matter or gangue, consisting in mixing material with water, bringing material intimately into contact or thoroughly mixing it with suitable pure thin oil, as kerosene or paraffine oil, projecting at considerable velocity mixture so produced under surface of volume composed of material, water and oil, allowing oil and graphitic substance adhering thereto to pass upward to surface, and drawing off from surface oil and graphitic substance on arrival at surface.

METHOD OF EXTRACTING MOISTURE FROM AIR FOR BLAST FURNACES OR CONVERTERS.—No. 771,058; J. Gayley, New York, N. Y.

Method of feeding air blast to blast furnaces or converters, consisting in feeding air into refrigerating chamber, forcibly distributing it therein in cur-

rent directed successively in varying directions, and cooling it artificially to reduce its moisture to small percentage, feeding dried air to blowing engine by initial pressure of relatively small degree sufficient to overcome in whole or in part friction of air current in apparatus, increasing its pressure at blowing engine to degree above that to which it was initially subjected and feeding dried air therefrom under compression from time it leaves blowing engine until it enters furnace or converter.

MINE TRACK SYSTEM.—No. 770,882; J. Whitehead, Farmington, Ill.

In mine track system, combination of rail, switch plate located intermediate ends of such rail and provided with slotted portions, short rail section integral with switch plate and abutting with one end of main rail, integral rail section formed upon switch plate having straight portion and converging portion, and switch plate between its integral rail portions having beveled or tapered upper face in manner and for purposes specified.

PRESSURE CONTROL FOR AIR COMPRESSORS.—No. 770,785; E. H. Steedman, St. Louis, Mo.

In air compressor combination with cylinders of duplex single-acting air compressor, of separate hollow cylinder heads arranged thereon, suction chamber in each of heads, suction chambers communicating with each other between two heads, suction chamber in walls of cylinders also in communication with suction chambers in heads, suction valve in each suction chamber, which valve is introduced from cylinder side into inner wall of cylinder head, and common means for stopping operation of suction valves.

PROCESS OF MANUFACTURING ARTIFICIAL STONE FROM MAGNESITE.—No. 771,062; C. Groyen, Bonn, Germany.

Process of manufacturing artificial stones from magnesite and hydrochloric acid which consists in mixing magnesite in any form or condition with strong concentrated hydrochloric acid, neutralizing resultant mixture with magnesite and ammonia and incorporating suitable fillers with mixture.

# Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE  
MINING AND SCIENTIFIC PRESS.

G. D. Roberts, Director of the U. S. Mint, reports production of gold and silver in the United States for the calendar year 1903, for the principal States and Territories:

State.	Gold Value.	Silver, Commercial Value.
Alaska.....	\$ 8,614,700	\$ 77,554
Arizona.....	4,357,600	1,829,034
California.....	16,104,500	503,010
Colorado.....	22,540,100	7,014,078
Idaho.....	1,570,400	3,513,996
Montana.....	4,441,900	6,888,842
Nevada.....	3,388,500	2,027,070
New Mexico.....	244,600	97,558
Oregon.....	1,029,200	62,720
South Carolina.....	100,700	162
South Dakota.....	6,826,700	119,448
Texas.....	245,376	245,376
Utah.....	3,691,400	6,046,272
Washington.....	279,900	159,030
Wyoming.....	3,600	108
Totals.....	\$73,193,300	\$28,565,258

The total number of fine ounces gold produced in the United States for the calendar year 1903 was 54,300,000. The value of silver is computed at 54 cents per fine ounce. The total output of gold shows a decrease of \$6,400,000, and of silver a decline of 1,200,000 ounces from the figures of the previous year. The falling off in both metals is almost entirely due, according to the Director's report, to labor troubles in Colorado. The most important gain by any State was about \$500,000 in gold by Nevada.—The following table, included in the report, shows the world's production of gold and silver for the calendar year 1903:

	Gold Value.	Silver, Commercial Value.
United States.....	\$73,193,300	\$28,565,258
Mexico.....	10,677,500	38,070,000
Canada.....	15,839,500	1,700,800
Africa.....	67,998,100	185,300
Australia.....	89,201,100	5,228,700
EUROPE—		
Russia.....	24,632,200	82,000
Austria-Hungary.....	2,451,100	877,000
Germany.....	70,500	3,144,100
Norway.....	2,700	2,700
Italy.....	25,700	435,400
Spain.....	5,400	2,209,100
Greece.....	.....	573,300
Turkey.....	30,700	247,800
France.....	.....	403,600
Great Britain.....	77,300	79,000
SOUTH AMERICA—		
Bolivia.....	1,000	4,834,600
Chile.....	66,900	1,402,600
Colombia.....	2,724,400	609,500
Ecuador.....	274,400	.....
Brazil.....	274,200	.....
British Guiana.....	375,900	.....
French Guiana.....	2,101,500	.....
Peru.....	693,200	943,200
Central America.....	1,012,432	234,000
ASIA—		
Japan.....	2,002,700	292,900
China.....	7,324,700	.....
Corea.....	3,000,000	.....
British India (British).....	11,428,900	.....
East Indies (British).....	1,170,200	.....
East Indies (Dutch).....	501,500	66,200
Totals.....	\$320,048,900	\$88,291,558

The total number of ounces of gold is given as 170,443,670. These figures show a gain over the output of 1902 of \$29,637,600 in gold and 9,109,331 ounces in silver. The commercial value of the silver output is \$6,572,400 greater than in 1902 at the average price of 54 cents per ounce, compared with 53 cents in the previous year. The most important gains in gold were \$28,974,400 in Africa and \$7,631,300 in Australia, and the most serious loss was in the United States. The most important change in silver produced was in Mexico, which reports an increase of 10,323,308 fine ounces. Australia shows a gain of 1,656,928 ounces silver.

## ALASKA.

The Alaska-Mexican G. M. Co., at Treadwell, J. MacDonald superintendent, reports for month of August: 120-stamp mill ran 30½ days, crushed 19,693 tons of ore; value of bullion, \$27,861; saved 479 tons sulphurets of estimated value \$32,155; working expenses for month, \$30,112.—Alaska-United G. M. Co. for August: Ready Bullion claim—120-stamp mill ran 30½ days, crushing 20,210 tons ore; value of bullion, \$15,714; saved 360 tons sulphurets of estimated value of \$9856; working expenses for month, \$26,617.

The annual report of the Alaska Treadwell M. Co., operating at Treadwell on Douglas island, for the fiscal year ended June 1, 1904, shows the 240-stamp mill ran (with both steam and water power) total of 341 days 22 hours, crushing 370,648 tons of ore. The 300-stamp mill (using water power only) ran 244 days, crushing 404,502 tons of ore. Total tonnage crushed by 540 stamps, 775,150 tons. Total of 939,137 tons of ore were broken in the mine and 74,575 tons sent to mills. The ore reserves are estimated at 4,017,289 tons. Ore sent to mill included 26.2% from stopes on 440-foot level, 43.7% from pits and underhand stopes above 110-foot level. An average of 37.5 machine drills were operated daily in the mine—18.5 on stoping, 9 on development, 7 in pits and 3

in cutting out. Per 10-hour shift each drill averaged 33.55 feet of holes and 1.02 tons of ore were broken for each foot drilled. Development and exploration work done during the year was:

	Feet.
Drifts.....	2,733
Raises.....	4,051
Intermediate drifts.....	1,281
Shafts.....	759
Crosscuts.....	415
Shaft sinking.....	183
Total.....	9,372

Connection has been made by main east drift on the 750-foot level with bottom of the Alaska United shaft. The mills produced \$892,888 in bullion, or \$1.152 per ton of ore crushed, and \$936,620, or \$1.208 per ton, in bullion from concentrates. Costs were divided as follows:

	Per Ton.	Total.
Mining.....	\$0.9724	\$753,720
Milling.....	0.1583	122,658
Sulphurets.....	0.1461	113,236
General expense, Douglas island.....	0.0231	17,914
San Francisco office.....	.....	6,908
London office.....	.....	1,253
Paris office.....	.....	230
Consulting engineer.....	.....	1,183
Bullion charges.....	.....	8,214
Taxes.....	.....	2,880
New construction and repairs.....	.....	36,389
Total.....	.....	\$1,064,585

Skilled labor was scarce during the year. Machine men, underground, received \$2.50 per day with board and lodging, and same work in the pits pays \$3.50 per day with board and lodging. The foundry produced 482,627 pounds iron castings and 5652 pounds brass castings.

## ARIZONA.

### Cochise County.

At Paradise there are five companies operating mines. The Chiricahua D. Co. has a crosscut tunnel in 770 feet, cutting the ledge at a depth of 280 feet from the surface. A vertical three-compartment shaft has been sunk 300 feet. On the west side of the mountain, 15,000 feet from the main shaft, they are sinking a two-compartment shaft. The surface plant contains a double-drum steam hoist of 2000 feet capacity, a 20-drill compressor, two 150 H. P. boilers, pumps, etc. J. H. Knowles is manager.—The Duluth & Chiricahua D. Co., composed of M. & B. Pattison, T. Bardon and G. H. Crosby of Duluth, Minn., has bought the Sullivan group of seven claims, near Paradise, and has begun development work.—The Rieder group of ten claims, 1 mile east of the Sullivan group, is being developed by U. Rieder, owner, who reports opening up quartzite carrying iron and copper sulphides.—The Davis group of seventeen claims has been bonded to the Cochise Con. Co., H. Alexander president and H. H. Douglas consulting engineer, both of New York City. The company has twenty men at work on development and will increase the number to forty-five.

### Gila County.

At Globe the Old Dominion management last week blew in the first furnace of the new plant. Work done during the week included grading for the bullion dump and for additional tracks, the construction of the storage bins on the old smelter site, the shifting of the standard tracks and the laying of tracks for the hauling of bullion and slag, completion of the platform and skids for the lining of the converter shells, and completing the pipe connections. The machinery in the power house has been tested. The locomotive for hauling slag and the electric motor to deliver the ore from the bins to the furnaces are in operation.

### Graham County.

The Santa Rosa C. Co. holdings have been bought by the Detroit C. M. Co. at Clifton.

### Yavapai County.

(Special Correspondence).—The Mt. Union Con. M. Co., which recently acquired the properties of the Mt. Union and Arizona-Michigan mining companies, is erecting a mill on its properties in the Hasayampa district, 15 miles south of Prescott. The plant will comprise two 60 H. P. boilers, 50 H. P. engine, two Huntington mills, four concentrating tables, Gates rock breaker, etc. Two hoisting plants are already in operation on the property. Prescott, Oct. 4.

The Palace G. & C. Co. has men at work on its Tip Top group, south of Prescott, near the Maricopa county line. The camp was formerly a silver producer, but gold values are now being taken out. A tunnel is being driven on the Carbonate Queen.

H. L. Hall, manager of the United Miners G. & C. Co., has bought the Buster group near Prescott and has put men on the mine and mill overhauling equipment.

The George A. Treadwell Co. is putting in a hoist at the Hackberry mine at Mayer. As soon as the smelter is completed they will put on additional men.—T. B. Bassett of Prescott, consulting engineer of the Yavapai G. M. Co., whose

mines are on the Agua Fria river, near Mayer, says the company will equip same with steam hoist.

Work has been resumed at the Crowned King mill at Crown King, in the Bradshaw mountains.

F. C. Smith, superintendent of the Socorro mine, near Martinez, says he will reopen the mine and increase developments. The mine will not be operated until sufficient development work has been done to insure a supply of ore. Fifteen men have been put to work.

## CALIFORNIA.

### Amador County.

At the Wildman mine, near Sutter Creek, there are thirty men employed, there being seventeen at the Wildman shaft, five at the Mahoney and eight at the Lincoln. At the Wildman shaft a 55-foot derrick is being put up for handling timbers. It will be run by water power. Timber, consisting of logs, lagging and lumber, is being put away for use this winter. At the Lincoln shaft the water is down below the 1700-foot level. Where there are no crosscuts or drifts to be drained, the shaft is emptied at the rate of 60 feet per day. Superintendent Ross expects to have the shaft clear this week. Work on the drift to be run from the Lincoln shaft to the Wildman will begin about October 10th.

A larger hoist will be put in at the Zella mine, near Jackson, and will enable the shaft to be sunk to 3000 feet, says Manager Detert.

At the Zeila mine, near Jackson, repairs to the shaft have been completed. A station is being cut at the 1450-foot level. Sinking will carry the shaft 300 feet deeper, providing for opening up of three more levels. It is hoped to be able to run one-half the stamps during that time. Manager Detert says an electric pump will be put in.

The Red Hill quartz mine near Butte City, near Jackson, has been bought by W. E. Stewart for \$5000, for the Jose Gulch M. Co. The mill will be started as soon as water can be secured in the Horn ditch by the early rains. This ditch will be cleaned out. It has been idle for several years.

### Calaveras County.

The Sultana mine (formerly the Fritz & Bovee) at Angels is closed down.

At San Andreas the San Andreas Blue Gravel M. Co. has been incorporated by W. M. Nuner, Jr., J. A. Stewart, F. J. Juchter, H. W. and B. E. Miller to operate on gold-bearing gravel channels being opened up on the Whitlock estate. There is a shaft sunk into the channel and a hoisting and pumping plant will be put in.

It is reported the Big Trees M. Co. of Stockton, owning mines on the Stanislaus river, above Murphys, proposes to build a smelting plant at Murphys. G. J. Thompson is secretary.

At West Point, the Lone Star mine, idle for the past year, has again started up and has fifteen men working, with two machine drills in the shaft. The mine is being worked by the Farmington G. M. Co., under management of M. D. Newell.

The Fred Greve property has been opened up and a ledge uncovered. A hoist is being put up, also engine and boiler.—The Burns mine, worked by Superintendent Hitchcock, is running full blast. They are sinking on the vein.

The Black Oak G. M. Co., operating near Angels, will develop and operate the Maltman mine at Angels. J. J. Meyers of San Francisco is president of the Black Oak Co., and R. E. Walsh, on whose property the Black Oak mine is situated, is superintendent and manager. An 8-foot ledge of ore showing free gold and sulphurets has been struck. A crosscut is being run west from shaft.

Work has been resumed in the Prince mine at Altaville, near Angels, now under lease to the Altaville G. M. Co.

### El Dorado County.

The owners of the Rio Vista copper mine, near Fair Play, report development of the vein satisfactory. They have ore 13 feet vein, with payable copper values. They have been sinking a shaft from a tunnel which is to connect with a lower tunnel. They are cutting out timber from the wagon grade to connect with the railroad—3 miles away—at Cole's. J. H. Bradley is interested.

### Kern County.

Bakersfield reports say extensive deposits of bicarbonate of soda, 86% pure, have been found in Lake Carissa, 13 miles from Olig, on the McKittrick branch line of the Southern Pacific R. R., and a San Francisco company has made application to the Kern County Board of Trade for a five-acre site at Bakersfield for a refinery.

### Mariposa County.

The Mt. Gaines mine, near Hornitos, has been sold to Los Angeles men, who will resume development and operation of

the property. The shaft is sunk to 300 feet, and at the 300-foot level ore was being taken out when the mine closed down four years ago. A 10-stamp mill was on the mine, power being supplied by a 180 H. P. electric motor. The Consolidated M. & P. Co. of Los Angeles, of which W. T. Carter is secretary and treasurer, has bought the Mt. Gaines. Pumping out the mine will start this week. About a year ago the stamp mill burned down.

### Nevada County.

The Esperance Drift M. Co. has been reorganized at Nevada City to open a gravel mine near French Corral, on San Juan ridge. F. Searls is president, E. T. R. Powell vice-president and D. E. Morgan secretary.

After several months of idleness the Mountain Maid mine, near Nevada City, is being reopened by Manager Pusheck. The pumps are unwatering the mine. A ditch 8 miles in length will bring water power to the mine. R. Riley has been appointed superintendent of the Mountain Maid.

The New York-Grass Valley G. M. Co. has bought 120 acres of mineral lands adjoining the 600 acres which they already own. The land has veins of ore. The company will put in ten stamps additional to handle its surplus ore. G. W. Root is manager.

Operations will be started near Graniteville, near Nevada City, by J. McKelvey. There are ten claims, known as the Southern Fork mines, on the south fork of Poorman's creek, ¼ mile from Graniteville. They were worked several years ago. Men have been put on and supplies taken to the camp.

The Pittsburg mine, near Town Talk, near Nevada City, has been bonded to E. O. Ord and Eastern men. The company proposes to put in an air compressor and power drills. No. 6 level will be extended north and south. The seventh, eighth and ninth levels will be extended. The two-compartment shaft will be put in running order. The 10-stamp mill will be remodeled. The main shaft is down 1000 feet on the incline.

As a result of six days' run at the Orleans mill of ten stamps, near Nevada City, Superintendent Brockington reports producing a gold bar valued at \$3000. The ore came from the Houston Hill north, some of it averaging \$75 per ton.

The Drummond mine near Canada Hill, near Nevada City, has been bonded to B. Graves, P. Heintz et al. They are arranging to put in a 3-stamp mill, and later enlarge to twenty stamps. The mine shows a ledge 5 feet wide assaying \$20. The Blake, Grave & McDonald claim is on same section. The Gold King mine, owned by J. Beach & Sons, is also showing payable ore. G. Payne has a 5-stamp mill, and Bell & Thomas have a 10-stamp mill running in that section.

### Shasta County.

Redding reports say next week fifty men will be at work on the Clipper mine near Kennet, which has been idle. J. M. Barron is principal owner of the Clipper group of mines. The 10-stamp mill that is on the property will be replaced by a modern 40-stamp mill.

### Siskiyou County.

A. H. Denny of Etna has bought the Herr ranch, on the Oregon road, between Yreka and Ager, and will open the coal mine there. Work will be resumed in the spring, as heavier pumping machinery is keeping out water. When work was suspended coal was being taken out.—The Mount Vernon M. Co., between Greenhorn and Cherry creeks, near Yreka, has the framework up for the quartz mill and machinery is being put in the same. The mill will be run by electricity. The sawmill, run by electric power, is supplying lumber for building and mining operations.—Manager Bryant, who bought the Crocker quartz mine at Deadwood, is putting up a quartz mill. It will be in running order before winter sets in.

### Tuolumne County.

R. P. Sibley of Los Angeles has a lease, with option to buy, for \$15,000 the Reward, Madison and April quartz claims in Basin district, southeast of Confidence.

The Jumper Syndicate at Stent, M. B. Kerr manager, will enlarge developments at the mine. The shaft will be sunk and exploration done. At present the ore is low grade.—L. F. Triplett has bought the C. L. Woodside interests in the Springfield Tunneling Co. placers, known as the Woodside gravel mine, consisting of 100 acres near Springfield, near Columbia.

At the Confidence mine, at Confidence, the mine will be run throughout the winter. Stoping is in progress between the 500 and 600 levels, south of the shaft. The cyanide plant has put through 17,000 tons, and will continue working until the heavy rains come, as the rain clogs

the tailings and prevents their being worked. The tailings are run into a basin below the mill, dried in the sun and mixed by two cultivators, which are drawn by two horses each. The tailings contain finely divided gold and about 90% is recovered. The mill of twenty stamps is in steady operation, says Superintendent H. Carmichael.

The Black Oak mill, near Soulsbyville, has been closed and the mine partially so on account of the shut-off of the water power. About thirty men will be kept at work, some of them sinking and others making repairs and improvements. The hoist and compressor will be run by steam, generated by crude oil burners.

At the Longfellow mine at Groveland the big hoist is ready for operation, having a capacity of 2000 feet. The stamp mill is said to be doing good work. It crushes five tons per stamp per day, says Superintendent Partington.

#### Yuba County.

Development work will be resumed near Rackerby in the mines on the Pauline farm, says Superintendent Webb. He will put men to work sinking a shaft on the lode.

### COLORADO.

#### Clear Creek County.

Near Idaho Springs, the Honest John Co. reports improvements being made on Chicago creek. Manager Puchert says the tunnel is in 780 feet and will go to the 1000-foot point. A blower for providing the workings with air has been put in. The company is also putting up several buildings, including a power house. The Honest John tunnel is being driven 8x8 feet in the clear, double tracks, and between the tracks a water box. The compressor plant is in operation. The Honest John Co. owns eighty-six lode claims on the line of its tunnel.

J. J. O'Neill, H. Leonard and P. Kennedy of Denver, owners of the Mammoth group in Brown gulch, near Silver Plume, are resuming operations. The tunnels will be cleaned out.

After being closed down for two months, the Terrible mine, near Silver Plume, has resumed operations. The mill will not be started up at present, it being intended to unwater and retimber the shaft below the tunnel level and put the lower workings in shape for further development. A pump has been set up, a hoisting engine being already in place.

The Mendota mill, near Georgetown, is shipping from forty to fifty tons of lead concentrates per month, and from 125 to 130 tons of zinc concentrates. About 400 tons of pyrite have been stacked up, from which shipments have started. There are four sets of lessees on the Mendota. The Sunburst mine is shipping ore to the Golden smelter. A large body of low-grade material has been opened up. Beside this low-grade ore is a body of smelting ore from which shipments are made.

Silver Plume reports say the recent reduction in the smelting and freight charges on low-grade ores has added 50% to the tonnage from that end of the county. About forty tons are shipped daily from the Pelican and Doris dumps, and Manager Eaton expects to double it.

Operations have been started on the Liberty Bell group of claims sold to B. J. Martelon, et al. who have organized the Silver Leaf M. Co. Manager Martelon will drive a tunnel at a point opposite the Terrible mine and about 600 feet above the creek. The Liberty Bell group is near the World's Fair mine, the Mary Etta group, of the Silver Plume M. & T. Co., and the Aldrich group in East Argentine district, near Silver Plume.

At Idaho Springs, the Central tunnel of the Big Five Co. last week passed the 4000-foot mark. The tramway to the Hudson mill is nearing completion, by which the mineral from the Shafter vein will be trammed direct from the tunnel to the mill, and thus avoid wagon haul.

C. I. Burt says he will resume operations on the Vulcan property, near Silver Plume. It is intended to drive a crosscut from the Pay Rock lode on the Silver Bank tunnel level to cut the Vulcan, which will thus be opened at 300 feet deeper.

#### Fremont County.

The Union mill at Florence, owned by the United States R. & R. Co., resumed operations last week, including the sampler, the chlorinating and roasting departments. The full capacity of the mill is 450 tons per day, but starts at 350 tons, with 180 men. Agreements have been made whereby ore will be received from the Golden Cycle, Theresa, Stratton's Independence and from the sampling works at Cripple Creek.

#### Gilpin County.

Eastern and Denver parties are interested in the operations of the Kathryn property, and are developing their group of claims in Pleasant valley by a tunnel from North Clear creek. They will put

in an electric plant and compressor. E. H. Roberts of Black Hawk is in charge.

About thirty men are at work at the East Notaway mining property in Lake and Russell districts, near Russell Gulch, all of whom are working on the leasing system, under the Town Topics G. M. Co. Milling and smelting ores are being shipped. Connections are being made between the 420 and 555 foot levels by raise and winze. The main shaft is down 603 feet, and Manager Josephi intends to sink at least 400 feet deeper. T. Martin is superintendent.

Idaho Springs stockholders in the Lucania tunnel have formed the Quartz Hill M. Co. which is operating a group of claims on Quartz hill at Russell Gulch. Development work has been increased and a new shaft sunk. Ore is being taken out, the milling product having been treated at the Alpine and Newton mills in Idaho Springs. The group will in time be cut by the Lucania tunnel at a depth of 2000 feet and worked through the tunnel.

The Pittsburg mine of the Cashier G. M. & R. Co., in Lake district, near Central City, is shipping first and second class smelting ores. The first-class ores run \$200 per ton, while the second-class ores range from \$50 to \$80 per ton. There is also a large tonnage of milling ores on hand for shipment to the concentrator. The company will put in a hoisting engine of 60 H. P. capacity, and expects to sink the main shaft, of 600 feet in depth, a farther 200 feet. Several lessees are working the ground above the fifth level and are taking out ores of smelting grade.

Colorado and Milwaukee, Wis., men have a lease and bond on the Modoc mine, on the "Patch" on Quartz hill, in Nevada district, near Central City. The main shaft is down 180 feet and it is intended to sink to the level of the La Crosse tunnel. A hoisting plant is being put up for temporary arrangement and will hoist ore for testing, after which the operators will install a larger hoisting plant and increase the top buildings. F. Soper is in charge as superintendent for the Union M. & E. Co.

The Black Hills & Denver G. M. Co. has added to its holdings in Boulder Park section, near Rollinsville, which now consist of 500 acres. Their Park tunnel is in 375 feet, and the B. & D. tunnel, on the south side of the park, is in 250 feet. Work on those tunnels is being increased. The water ditch from Jenny creek to the Park tunnel has been completed and the company will finish the power house and put in an air compressor and machine drills. It is also intended to erect a concentrating plant of 100 tons capacity and to furnish power to neighboring enterprises. The ores on the Park tunnel group are of sulphides. Molybdenum has been found in the Park tunnel and a shipment of that mineral will be made to Denver for treatment. S. H. Blakeslee is president and M. H. French manager, with J. Smith superintendent.

#### Gunnison County.

At the Golden Islet mine in Jones gulch in the gold belt, near Pitkin, owned by the Golden Islet M. & M. Co., ore is opened up for 100 feet, the vein being 3 feet wide and running \$10 per ton. The 10-stamp mill will be ready to start next week. The Gold Cross group in Box Canyon mining district, owned by G. Brant, is being worked. The shaft is sinking and shows a vein 7 feet wide with average value of \$20 per ton in gold. A steam hoist will be placed.

#### Hinsdale County.

(Special Correspondence).—For several months past L. Kafka has been leasing on the Hidden Treasure mine. He has spent several thousand dollars in retimbering and putting the mine in shape for operating. Some changes have been made in the mill and two more concentrators are being added. P. C. McCarthy, superintendent, says there are \$2,000,000 of ore in sight in the mine. The incline shaft is 1000 feet deep. They are working on the third and sixth levels. The aerial tramway from the mine to the mill is 3660 feet long. The mine is 1000 feet higher than the mill. This property is on Henson creek about 3 miles from Lake City. There are about fifty men working on the Hidden Treasure and forty more could be used.

Lake City, Oct. 2.

(Special Correspondence).—The Max mine is understood to have been sold for \$60,000 and the new owners will start work this month. Lessees are doing work on the Pride of America and shipping ore.

The Hannah M. & M. Co., which has been closed down, will start up again.

Capitol City, Oct. 2.

(Special Correspondence).—W. F. Smith, manager of the Bon-Homme M. Co., in Burrows Park, states they have a tunnel 1700 feet long and 1000 feet of drifting on the vein. The ore is sulphide carrying gold, silver, copper and lead

values. He is making a raise of 700 feet to connect with the old workings. Winter supplies are being hauled in. The new road from Silverton to Animas Forks is within 3 miles of the property. Ore will be packed over Cinnamon pass to Animas Forks, which will save a 24-mile haul to Lake City. Work is being done in the mine with air drills. It is the intention of the company to put in a mill as soon as certain legal controversies are disposed of. Manager Smith also states considerable prospecting is being done in the Park.

White Cross, Oct. 2.

The Handles Peak G. M. & M. Co. has been incorporated to operate in Hinsdale county. The directors of the company, which will have headquarters in Denver, are F. H. Sprague, S. T. McDermith, R. R. Bollinger, W. J. Robinson, F. A. Ellis, J. E. Young and W. C. Burrows.

#### Lake County.

Manager T. S. Schlessinger is carrying on development of his properties at Leadville through the Bon Air shaft with satisfactory results and is taking out fair-grade ore. The raise which he started from the drift in the Wood fraction has extended beyond the line of fraction and into the P. O. S. ground, where another body of mineral has been opened. The ore is yellow ochre carrying values in silver.

#### Summit County.

J. S. Morton of Columbus, Ohio, interested in the Mountain Pride and Deep Shaft mines, near Breckenridge, says he will resume operations. On account of shortage of water the Gold Pan placer pit has been shut down for the season.

Breckenridge reports say the Morning Star group on Mount Baldy is being developed under a lease by Zerbe, Condon et al. In former years the property was a producer of auriferous hematite. The mine is said to be frozen as deep as it has ever been worked—one shaft was 160 feet deep when work was discontinued. The present operators are driving a tunnel from the east slope of the ridge, near the Enterprise shaft. They had to do considerable timbering until they reached the frozen ground, which "stands" well without timbering. The frozen ground being difficult to drill, Superintendent Zerbe says he will put in a modified coal drill.

The Colorado & Wyoming Dev. Co., operating a group of lode claims on Mineral hill, near Breckenridge, is loading cars at the Gold Pan spur of the Colorado & Southern railroad with zinc-lead ore from the 11-foot vein opened from the Orthodox level, with a crosscut tunnel. The company has a contract to supply the zinc works at Canyon City with 3000 tons of its zinc ore by December 20. As the lead and silver ores which the mine produces lie parallel to one another in the same vein, the company expects to mine both metals at a profit. The Colorado & Wyoming Dev. Co. is owned in Breckenridge.

The Michigan mine on Sheep mountain, near Kokomo, has started work again. The mine is under lease to G. T. McDonald and is worked by a tunnel.

#### Teller County.

The Vindicator mine at Cripple Creek has 100 men employed on company account, exclusive of lessees. The company is shipping out fifty tons of ore per day that give average value of \$50 in gold per ton. The ore is being mined principally between the fifth and tenth levels.

H. H. Barbee of Colorado Springs has for \$200,000 bought the property of the Princess Alice Con. Co., comprising the Ruby, Abe Lincoln and Lafayette claims on Bull hill and the Bonnie Nell, Cutter, Mary Ann and Sido claims of the Bonnie Nell Con. Co., on Raven hill. The Cripple Creek Merger G. M. Co. has been incorporated to work these holdings, and will start operation on the Bonnie Nell, which adjoins the Moose mine. Part of this ground is already being operated under lease, the lessees having opened up several veins. The directors are B. Conger of Groton, N. Y.; E. C. Lusklin of Buffalo, N. Y., and H. H. Barbee, G. Sturgiss, E. V. Cumberland, R. J. Gwillim, A. F. Woodward, G. M. Davis and J. W. Pring of Colorado Springs.

Cripple Creek reports say J. M. Wright has an option on the Joe Dandy mine on Raven hill for \$100,000. The Joe Dandy has been a producer of high grade ore.

A bond for \$35,000 and a lease for two years has been obtained by Childers & Co. on the New Hope claim, which contains eight acres on Mineral hill. The leasing terms are 10% on all ore up to \$25 to the ton and 20% on all ore over \$25 to the ton.

A raise has been made in mill and smelter charges. About July 1st they made a cut in rates, but the charges have been abolished, and a new schedule put into effect. The cause assigned is that the American R. & R. Co. now has no

competition other than the Dorcas mill at Florence.

The comparative table of figures, f. o. b. to valley, is:

Grade—	Former Price	Present Price.
Half-ounce, gold per ton	\$5.50	\$ 8.25
One ounce	6.00	7.50
One and a quarter ounce	6.50	8.00
One and a half ounce	6.75	8.50
Two ounces	8.25	10.00
Five ounces		10.50
Ten ounces	9.00	11.50

The mill and smelter men say they have been handling and buying ore at a loss.

The Beacon Hill L. Co. has been incorporated by W. H. Roller, S. Murdock, W. Schofield, W. H. Ryan and B. Dismann, with main office in Salida. The company has a lease on the Old Gold mine on Beacon hill from the Old Gold Co. for two years, for 30% royalty on ore up to \$100 per ton and 40% on all ore over that amount.

The California mine, on Gold Hill, near Anaconda, will be started up again, says the Times.

The R. E. A. & A. cyanide mill on the Wild Horse mine, on Bull hill, at Victor, and, treating Wild Horse ore, is handling about eighty tons per day, which is giving returns of \$5 in gold per ton. The greater portion of the ore being handled is coming from the dumps. About 200 tons of ore is being mined and shipped to the Economic mill, giving returns of four ounces in gold per ton. The company is also doing development work.

### IDAHO.

#### Blaine County.

S. Smith, manager of the Greyhound M. Co., says the work of getting in their smelter material from Ketchum, the nearest railway station, is going ahead. After the material is hauled 85 miles to Wagon town, it is then packed 14 miles over a trail to the mine. He says a kiln of 50,000 brick is ready to burn and the sawmill is working. The smelter is expected to be ready for blowing in by Nov. 10.

#### Boise County.

The Blue Rock M. Co. has given a bond on its properties at Horseshoe bend to the Spear-American Exchange of New York for six months at \$75,000.

A. R. Schaffer of Boise and H. J. Myers of Chicago, Ill., for the Germania M. & D. Co., have bonded the holdings of the Black Hornet M. Co., and will build a reduction plant.

#### Cassia County.

Work has been resumed at the Melcher mine, in Cassia county, owned by the Melcher M. & M. Co. of Salt Lake City. The company is driving a tunnel to tap the ore bodies at depth.

#### Custer County.

The Mackay Telegraph reports improvements being made in the White Knob C. Co. smelter at Mackay. The company is putting in a briquetting machine and making other additions.

J. A. Cizek, manager of the Lost Packer mine at Loon creek, near Custer, says work is being done on Bismarck mountain. The Golden Sunbeam M. Co., under the management of C. E. Goble, is increasing development. From the deposits of free gold on this property the company is grinding out fifty tons a day with two mills, the ore yielding \$6 per ton on the plates. The ore is quarried. A consolidation of the Sunbeam and Montana properties is proposed.

#### Idaho County.

D. S. Nevins has started work of building a 200-ton cyanide plant for the Iron Springs M. Co., of which he is president. The mines are in Rapid River district, near Warren.

The mill at the Mayflower mine, near Warren, has begun operations, says Manager J. E. Jewell. The mill consists of a 50-ton grinding mill, with concentrators and cyanide equipment. In the mine two tunnels have been driven showing the main ledge 8 feet wide.

#### Owyhee County.

Work will be resumed at the Baxter mine on War Eagle mountain, near Silver City. Material for construction work is on the ground.

#### Shoshone County.

The annual report of the Bunker Hill & Sullivan M. & Conc. Co., operating at Wardner, for the fiscal year ended May 31, 1904, shows production of ore:

Mine.	Tons.
Bunker Hill	234,561
Sullivan	25,224
Stenwinder	9,928
Tyler	16,035

Total, concentrating ore.....286,208

Shipping ore.....2,505

Total production.....288,713

The concentrator operating 333.4 days, treated 285,828 tons of ore at a cost of 20.1 cents per ton, yielding 37,636 tons of concentrates. The ore is all taken from the

mine out through the Kellogg tunnel by electric haulage; and in addition to the ore, 47,000 tons of waste were handled. The haulage cost is 6.5 cents per ton. Stopping cost \$1563 per ton mined. Value of ore mined was \$48.66 per ton; Wardner operating costs totaled \$14.13 per ton; and freight and treatment charges were \$19.89; leaving operating profits of \$14.64 per ton of ore mined. Total costs per ton for stopping, tramming, concentrating, etc., show 20% lower than that of the lowest preceding year, says Manager S. A. Easton.

#### Latah County.

The Moscow opal mines are again to be opened and worked by the Clement-Campbell Co., Mrs. V. S. Clement having bought the farm on which the opal mines are located. They have put men at work opening up the mines that have been idle since 1893. The mines are 4 miles northwest of Moscow, near the Washington-Idaho State line.

#### Washington County.

A 20-stamp mill and other mining machinery for the Empress M. Co. of Big creek, near Council, are being put in, says D. M. Mackenzie, manager.

### MICHIGAN.

#### Houghton County.

The smelter of the Michigan S. Co. is 2 miles west of Houghton and is in full operation. It is built on a steep hillside, which enabled the designer to lay out the works to take advantage of gravity in handling mineral. The mineral from the concentrating mills is dumped into cylindrical steel bins, whence it is fed by gravity to the furnaces. The reverberatory furnaces are made to furnish power from their waste gases. A traveling crane operates the length of the casting room of the reverberatory building and casting is done by machinery, copper moulds being used. The ingots, weighing a ton each, are of unusual shape in order to permit their free discharge from the moulds, which soon crack from the intense heat, averaging but two casts each. The ingots are automatically dumped into running water, and after chilling are automatically landed on the receiving table, where they are stamped and loaded for shipment. The Michigan plant is handling the copper of the Baltic, Tri-mount and Champion mines of Painesdale. The blast furnace is working satisfactorily. Slags from the reverberatories are broken and hoisted by bucket elevator to the blast furnace. Slag discharge from the blast furnace is automatic and continuous, slag running into a settler and discharging by overflow into a strong current of running water, being granulated and carried thereby to the dump. The works are managed by F. I. Cairns.

### MONTANA.

#### Flathead County.

J. Maxwell et al. of Libby and Great Falls men are developing the Moulton and other copper holdings in the Rainy creek district, near Libby. They are also working placers.

#### Lewis and Clarke County.

The Montana M. Co. at Marysville reports for month of August at Drummond mine thirty-five stamps dropped for twenty-four days, crushing 1366 tons of ore, producing bullion bars and concentrates estimated to realize \$11,400; the tailings plant was employed for thirty-one days, treating 12,600 tons of tailings and fines, producing cyanide precipitate values of \$25,400; total (represented by 1470 ounces of gold and 13,170 ounces of silver), \$36,800. Expenditure: General maintenance and milling, \$6300; extraneous expenses (insurance), \$600; total, \$6900; treatment of 12,600 tons of tailings and fines, \$14,100; total, \$21,000.

#### Madison County.

C. L. Freiderichs, operating the Mammoth mine and mill, near Pony, is shipping gold-bearing concentrates to Helena. The free gold is caught on the plates, while the residue is run over concentrating and slimes tables.

E. L. Ballou of Igo, Cal., superintendent of the Garnet G. M. Co.'s group of mines, near Pony, is increasing development and other work. The tunnel, being driven under contract, is in nearly 1000 feet. The tunnel will be driven at least 200 feet farther before the main vein is reached.

#### Silver Bow County.

Separators with which to reduce the zinc-bearing product of the Alice mines at Walkerville are to be added to the equipment, says Manager Walker of Salt Lake City, Utah.

### NEVADA.

#### Elko County.

U. U. Withie of Ogden, Utah, with Boston, Mass., men, has bought a group at

Mountain City and a company is being organized. The ground adjoins the Resurrection mine, in which Withie is interested.

#### Esmeralda County.

(Special Correspondence).—C. Oddie has obtained control of the water supply of Alkali springs, 10 miles from Goldfield. He will build a pipe line to carry 100,000 gallons of water daily to the mines of Goldfield. Contracts have been made with the Combination M. Co. for water supply.

Goldfield, Oct. 2.

A. Tripp of Tonopah, president and superintendent of the Tonopah Railroad, says his company has surveyed two lines for a railroad into Goldfield, and that the company proposes building a line into the camp as soon as the tonnage obtainable there is sufficient to justify a railroad. The company's present rolling stock of four engines and sixty 20-ton cars is kept busy at full capacity on Tonopah ore, with what is hauled by wagon from Goldfield.

The Sylvania mine was sold last week to G. L. Patrick, W. D. Clair and J. D. Shaefer, the last named being local manager. The mine is in Fish Lake valley, 30 miles southwest of Silver Peak, and consists of seven claims on which development work has been done, and there are 1000 tons of ore on the dump. The ore is silver-lead, both galena and carbonate, occurring in dolomitic limestone, which forms a contact with a granitic belt. There being ample wood and water in the district, they will build a concentrating plant and also resume development work.

The Utahna-Goldfield M. Co. has been incorporated at Ogden, Utah, to carry on mining in Utah and Nevada, with head offices at Ogden. The directors are O. A. Moyer, O. A. Kennedy, E. E. Harrison, W. B. Wilson and R. P. Hunter. The property of the company is a lease on north half of No. 1, Algae Fraction mining claim, at Goldfield.

The following estimate of ore shipped from mines and leases of Goldfield since discovery of the camp in October, 1903, is reported by M. E. Ish, operating there. This is exclusive of all ore running less than \$100 a ton, as this kind of ore is placed on the dumps awaiting treatment plants in the camp. Shipments to the smelters total as follows:

Combination M. Co.	\$700,000
January lessees	250,000
Bowles & McCain lease on the Jumbo	250,000
The Curtis-Ridge lease on the Jumbo	150,000
Hennessey, Wingfield & Sweeney lease on the Florence	150,000
Vermilyea lease on the Jumbo	100,000

At present twenty more sets of lessees are shipping. The ore goes from Goldfield to Tonopah by wagon and thence by rail.

#### Humboldt County.

The De Soto M. Co. has been organized by members of the Sheba M. Co. of Salt Lake City, Utah, including G. W. Bartch, W. H. Child et al. The property, which adjoins that of the Sheba, south of Mill City, consists of twenty-four claims, eleven of which have been patented. Arrangements will be made whereby the ores from the De Soto will be treated by the Sheba mill.

#### Lincoln County.

J. V. Brooks of Salt Lake City, Utah, has started developments on the property of the Empire M. Co. at Freiburg.

J. T. Hume and M. Wilbur, owners of the Blue Ridge group of gold mines on Virgin river, near Caliente, reports they will put in a mill at the mines.—S. Gregory, of Reno, at the Virgin River district, reports having struck a 26-inch vein of gold ore on the Cloud Burst group, northeast of the salt mines north of the river. A 10-stamp mill will replace the arrastra on the Cloud Burst group.

The Old Roman M. Co., which bought the F. M. Frye mines in Newberry mountain, near Searchlight, has works under way. C. F. DePuy is manager.

The Quartette M. Co. at Searchlight will start up its 20-stamp mill on the Colorado river next week, says Superintendent F. J. Harrington. The company's mill at the mine continues in operation. The tailings will be cyanided.

The management of the E. & F. group of mines, near Pioche, is shipping copper ore carrying values in silver, lead and gold. A. C. Ellis of Salt Lake City, Utah, part owner, says that in the lower tunnel, by which the ledge has been tapped at a depth of 400 feet, there is exposed 6 feet of ore of commercial quality.

The tunnel of the Blue Bird, one of the Caliente G. M. Co.'s claims, at Caliente, is in on the free gold-bearing ledge crosscut for 12 feet in the shaft. It is said a mill will be built at the mine.

#### White Pine County.

The Pilot Knob G. M. Co. of Monmouth, Or., is putting up a 2-stamp mill and concentrator at Willard creek, near Osceola. W. C. Williams of Olinghouse, near

Wadsworth, is opening up the Addie C. mine at White Horse canyon. The hoist is being set up. The vein is said to be 60 feet in width and carries gold-bearing pyrites that assay from \$6 to \$11. About 40% of the values may be recovered by amalgamation. The vein is nearly vertical.

#### Washoe County.

Reno reports say a strike of free-milling gold ore has been made on the Schour claim, ½ mile from Derby station, on the Southern Pacific line. A shaft has been sunk and the vein is being followed. Free gold is visible in the ore.

### NEW MEXICO.

#### Dona Ana County.

Gold Camp is on the east side of the Organ mountains near Organ, 25 miles northeast of Las Cruces and 45 miles southwest of Alamogordo. It consists of a natural basin about 16 miles long and 6 miles wide, surrounded on three sides by mountains. This basin lies 4500 feet above sea level. Among the mining interests that are developing is the Dona Dora Co. property, which consists of thirty claims. The company is composed of New York and Philadelphia, Pa., men and they are increasing work. The Mormon M. & M. Co. has claims which are being developed and which have produced profitable shipping ore. As freight and smelting charges are high, the company is building a concentrating plant and will be in operation by Dec. 15.

#### Grant County.

(Special Correspondence).—The Boston Co.'s copper mines in the Burro mountains are concentrating the low-grade ores and shipping a good tonnage of concentrates. They are operating the mill moved there from Pinos Altos. It is said they have recently opened several large bodies of 8% to 10% ore in the Sampson and St. Louis claims. The property is now controlled by the Leopolds of Chicago.

The Comanche Co., rebuilding the Silver City reduction works, which were burned last year, will have a large amount of ore on hand by the time the work is completed.

Silver City, Oct. 3.

#### San Miguel County.

Machinery for the mill of the Blake M. Co. has been moved to the mines near Rociada. A flow of water sufficient for all purposes has been opened on the Three Brothers mine.

Considerable work is being done on the mines of the Pecos M. Co., in Hamilton mining district, on the Upper Pecos river, near Pecos. Additional machinery has been installed. The group of mines owned by the company carry copper, silver and gold values. The company also owns several coal prospects.

#### Taos County.

At the Green mountain mines, Manager Fairchild of the Green Mountain M. Co., at Dixon, says they are down 80 feet and started drifting and are opening up ore. Work on the tunnel has stopped for the present. Assays show up to 25% copper and fifty ounces silver. Ore is being shipped to Pueblo, Colo., which averages 12% copper.

M. D. Pierce and A. Mason are having ore treated at the Jayhawk mill, near Red River, to determine the process best adapted for treatment of the ore, which is from the Carrie mine in Pioneer gulch.—J. Bowman last week cut a 3-foot lead on the Ajax mine, near Red River.

### OREGON.

#### Baker County.

(Special Correspondence).—L. R. Bellman, manager for the Turnigan Arm M. Co., owning the Cracker-Oregon mine at Bourne, will begin extensive operations on that property this week. Over a year ago the company completed a 20-stamp mill, but have never milled any ore, although a considerable amount of high-grade milling ore is said to have been found in the lower tunnel. The Cracker-Oregon is an adjoining property to the E. & E. and on a parallel vein.

O. Herlocker, superintendent of the Highland mine, has plans for a concentrating plant which he proposes installing. Several four-horse teams are hauling ore from the Imperial mine in Cable Cove to the Sumpter smelter. The ore is being assorted from ore bins and dumps and was mostly taken out of the mine several years ago.

November 18 is the date set for the final adjustment of the Red Boy mine litigation, and by that time the new management will begin operations. Among other improvements they propose to complete the power plant, as planned by the old company. Estimates have been made from preliminary surveys, that the water from Olive lake can be carried by pipe line a distance of 8 miles, and in sufficient

quantity to generate 4000 H. P. of electric energy.

C. J. Johns of Sumpter is getting patent on the Maiden's Dream group. Three years ago a mill was erected on this ground and rich ore milled for a short time. Litigation interfered with operations for a time, but has now been adjusted.

Sumpter, Oct. 4.

Manager Wright of the Blue Bird mine, near Sumpter, says the stamp mill is ready for operation. A cyanide plant of 100-ton capacity will also be put in. Ore from vein No. 2 will be handled by the stamp mill, while that from the large, low-grade body in vein No. 3 will be treated by cyanide.

G. W. Daines, manager of the Belcher mine near Greenhorn, says he has started work of building a stamp mill.

A. Burch of Spokane, Wash., manager, says work has started on installation of a gold dredger of 2000 yards daily capacity on the Crane Flat placers, near Sumpter. The Burch & Burbridge Co. owns 200 acres of placer ground at Crane Flat.

Manager J. Doyle of the Gold Coin group in Cracker Creek district, near Sumpter, reports progress being made in the crosscut tunnel, which will go 1500 feet before being completed. The property is owned by the Citizens' Con. G. M. Co. of Virginia. There are fifteen claims in the group. The compressor is operated by steam.

The manager of the Sumpter smelter at Sumpter has leased the Baker City sampling works and will operate them.—An air compressor has been added to the Gem mine, in Sparta district.

At Greenhorn, A. Larsen and H. Smith, owners of the Salmon group, will, with Cincinnati, Ohio, men, increase development work. The group, comprising eleven claims, is 2 miles west of Greenhorn, on Salmon creek, below the Intrinsic mine. Work has been centered in a crosscut tunnel. A compressor plant will be put in, and in addition to continuing the tunnel, drifts will be run on veins 2 and 3.

A strike of free milling ore is reported in the Lost Cabin group, in Minersville district, near Sumpter. On the surface the ledge matter assayed \$2.50, but in the crosscut assays run \$10 in gold. R. F. Evans, the owner, states they will go lower down the hill and run another drift.—In the same district, on the Golden Wizard, a tunnel 700 feet long has been run and a shaft sunk to the ledge. Two pumps and two 75 H. P. boilers have been required to keep it dry. A hoist has been put in and a mill partly built, but the machinery is not yet in place. It is intended by the Golden Wizard management to drive a crosscut tunnel to 3000 feet. This will cut several parallel ledges and also drain the upper workings.

The Buffalo mine, 2 miles north of the Magnolia mine, near Sumpter, in the same zone as the Cougar and Monumental, is working and shipping ore. The property is owned by N. T. Berkeley et al. of Pendleton. More men will be put on.

A bond and lease from the Eagle M. Co. has been given to Arthur & Shanks on the Eagle Con. mine, which embraces the Imperial and twenty claims in Cable Cove, near Sumpter, for \$75,000. In addition to the lease on the Imperial, they have also a bond on the Miner, the adjoining mine. The milling plant being built is partly on the Miner. The new drift on the Imperial vein will be started on the Miner, giving an additional depth of 150 feet and allowing economical handling of ore to the mill. Steady shipments of ore and concentrates being made to the smelter will be increased.

The Auburn Deep M. Co. is increasing development work at Auburn. A shaft has been sunk 200 feet and a drift started from the 100-foot level and the gold bearing gravel channel is being opened up. A steam hoist has been set up and the deposit will be hoisted to the surface and washed.

#### Columbia County.

H. D. Staley, who is developing coal mines near Columbia City, says veins have been uncovered and his men are running a crosscut. Where the main vein was uncovered it is 4 feet in width. The coal is of good quality, and the mine is near the Columbia & Nehalem Logging Railway, by which coal can be shipped to Portland.

#### Grant County.

Shipments of ore have been resumed from the Buffalo group, 2 miles north of the Magnolia mine, near Granite. The Buffalo is under lease to Clark & Donovan, and owned by N. T. Berkeley et al. of Pendleton. Another crosscut tunnel will be driven.

#### Douglas County.

(Special Correspondence).—A ditch 4½ miles long is being built to convey 2000 inches of water from Reuben creek to the Harris Flat placer, near the mouth of Grave creek. It will be completed for

next season's run. A. M. Scott and A. W. Shearer are rushing preliminary work on the placer claims of the Gold Flat M. Co. Glendale, Oct. 4.

Development this season on the Pittsburgh group, near Bohemia, is reported, showing satisfactory results. The group of six claims, owned by W. H. Sharr and others, is at the head of Rock creek, on the Monte Rico ridge, 2½ miles from the Musick mine, at Bohemia. Over 700 feet of tunnels have been run. The main crosscut tunnel, in 160 feet, will cut seven ledges in 1000 feet, and will then have vertical depth of 1000 feet. The group has timber, water power and millsite, and a wagon road will be built by which machinery will be taken in.

Bohemia reports say a body of milling ore is opened up in the Twin Rock group of nine claims, on Twin Rock Ridge. The main working tunnels is being driven and a crosscut shows 15 feet of ore. The owners of the properties in that section of the district are arranging to combine for construction of a wagon road to connect with the main stage route, to facilitate transportation of machinery next season.

#### Jackson County.

(Special Correspondence).—The Bieveu Bros., on Rich creek, intend to enlarge their operations this winter and will use a 6-inch pipe, 600 feet long, and have pressure enough to readily handle the red clay and gravel formation of their claims. The pipe line is completed, as are also the ditch and reservoir.

The Blue Ledge C. Co. has bonded the J. Bars land, owned by J. L. Willetts, consisting of 160 acres. In the tract are several acres of level land, having good water supply, which makes it desirable for a townsite. Stages make semi-weekly trips between Watkins and Jacksonville. Watkins, Oct. 3.

(Special Correspondence).—The Oregon Belle mine, on Forest creek, 12 miles southwest of Jacksonville, is being developed. The group consists of nine claims in slate and diorite formations, with two ledges 4 feet in width, with a northeasterly trend. The Oregon Belle claim shows a pay shoot of 18 inches, while the Gold King claim has a 3-foot ledge of free milling quartz. Developments are mostly on the Oregon Belle, by several drifts and tunnels connected by raises. The 250-foot shoot of pay ore is cut by these drifts at 100 feet apart. Work now consists in driving a crosscut tunnel to strike the ledge at 940 feet below its apex. After drifting 200 feet on the new level a crosscut will be run to cut the ledge of the Gold King 230 feet below the surface. The ore of the Oregon Belle is free milling, with values averaging \$17 per ton, and that of the Gold King an oxidized ore with quartz, with average values of \$8 per ton. The Oregon Belle has eight levels. The mill and lower tunnel are at an elevation of 3300 feet above sea level. An abundance of timber and water for all purposes is at hand. The equipments are a 3½-foot Huntington mill, a concentrating table, a return tubular boiler, just installed, and two 2½-inch machine drills. The property is owned by the New York & Western M. Co., with home office at Amsterdam, N. Y. W. S. Roberts is president and A. H. Gunnell, Grants Pass, Western manager. Jackson, Oct. 4.

The Homestake mine, near Woodville, has its 5-stamp mill ready for operation. A body of high-grade ore has been developed.

R. A. Miller of Portland says he will resume development work on his quartz mining properties adjoining the Opp mine, near Jacksonville. A stamp mill will be built.

#### Josephine County.

(Special Correspondence).—Three miles north of Leland, A. E. Reeves, representing Mullan, Idaho, parties, is developing a group of three claims, through which runs a 20-foot ledge enclosed in diorite and slate. The ore is quartz with chalcopryite, carrying 7% copper and \$2 in gold. The Benton group of seventeen claims, in Mt. Reuben district, has over 4000 feet of development, including one tunnel of 1460 feet, with raises of 200 feet and other workings giving 500 feet of backs. The general formation is syenite and granite. About 20% of the ore is free-milling and 90% of the values can be saved by cyaniding. Sinking is the system of development and the ore is stacked on the dump ready for a cyaniding plant to be placed in the spring. Placer ground and mill sites are in connection with the property. J. C. Lewis and R. Jones have been developing this property.

The ideal gravel mine, owned by Blaisdell and others, in Mt. Reuben district, covers 700 acres of bench land. The owners are starting to construct a ditch, including 6 miles of flume and piping, the whole to cost \$50,000.

The Columbia gravel mine, owned by Lewis Bros. of Portland, near the Green-

back quartz mine, works forty men during the winter season.

Five miles east of Leland, T. J. Macklin and A. J. Bennett are developing a free-milling proposition: the ledge matter is in granite and porphyry. A tunnel and an incline shaft have developed ore bodies which, by arrastra, yield \$20 per ton in gold.

#### Leland, Oct. 4.

(Special Correspondence).—The Copper Stain group of claims, in Mt. Reuben district, is being developed under management of W. H. Dana. The vein is in diorite. The ledge is 2 feet in width with quartz giving mill returns of \$15 in gold. From the several levels are over 2000 feet of drifting. The mine is owned by Springfield, Ill., men.

#### Grants Pass, Oct. 4.

(Special Correspondence).—On Jump Off Joe creek, near Grants Pass, and about 3 miles north of the Granite Hills property, is the Oro Fino group of three claims, owned by S. Chase of Portland. There are several ledges averaging 4½ feet in width in diorite. The pay streaks vary from 18 inches to 40 inches of free-milling ore near the surface, changing to high-grade sulphurets with depth. Development has reached a depth of 240 feet and is in ore. Values in the main ledge \$15 to the ton and in the laterals \$30 in gold. The ledge of the Elkhart, an extension, has a 400-foot tunnel showing a 16-inch pay streak of \$21 ore. Improvements are a roll crusher, Sturtevant rolls, a Fairbanks-Morse steam hoist of 25 H. P. and a 50-ton cyaniding plant.

One of the extensive gold-bearing channels in southern Oregon is that owned by the Old Channel M. Co. on the benches above where Galice creek empties into Rogue river, 20 miles west of Grants Pass. It has been proven 2400 feet in width in places, with banks of gravel averaging 120 feet in height. The holdings consist of 1500 acres, 900 acres being patented and extending 4½ miles in length. The property is worked by J. R. Harvey, part owner, under lease. With the available supply of water and an unlimited dump, he handles 10,000 cubic yards of gravel daily at an expense of 2½ cents per cubic yard. The ditch and flume, 12 miles in length, carry 5000 inches of water and deliver it at the mines under a pressure of 510 feet by three 6-inch nozzles with No. 4 giants. The gold of the channels is coarse, with a value of \$19.33 per ounce, while that from the banks has a value of \$18.25 per ounce. The lower gravel of this mine has been found to contain metals of the platinum group—platinum, osmium, ruthenium and iridium. The concentrates are easily saved, as 1300 yards of gravel make one cubic yard of concentrates, and in regular season one ton is saved every two days. Manager Harvey is repairing at all points, preparatory for a heavy season's work. The arrangement of the sluice channel is such that there is a constant gravity flow to the center and off to the dumping ground.

#### Grants Pass, Oct. 4.

J. T. Breedon has leased and will operate the Nunan hydraulic mines of Forest creek, near Grants Pass. These mines cover 150 acres of placer ground. The water rights supply the diggings through two ditches, one giving 280 and the other 580 feet pressure.

Superintendent H. Foster of the Oregon Belle mine, on Forest creek, near Grant's Pass, reports improvements being made. The Oregon Belle is owned by the New York Western M. Co. Developments will be increased and they will put in a 10-stamp mill. Superintendent Foster says the compressor plant is ready to run. Two drills will be used and men put to work extending the two tunnels now opened.

Grants Pass reports say the Benton mine of Mount Reuben, which has been undergoing development for two years, is to have a 40-stamp mill. The Benton is owned by J. C. Lewis of Portland and R. Jones, the latter being superintendent. A 1400-foot tunnel has been driven all on the vein.

The Golden Drift M. Co., at the Rogue river, near Grants Pass, is placing turbines to supply power and water to the Dry Diggings placers. There remains only the installation of the pump, the laying of pipes and the setting of giants. Manager Ament says this will be completed in November. The four turbines in place will give sufficient power for present requirements, and the number will be increased later. The company will supply power not only for its own uses, but for surrounding mines. The pumps for the Golden Drift dam are of the five-step centrifugal type, each one having a weight of 42,000 pounds, and each capable of delivering 9000 gallons of water per minute to a height of 800 feet and giving it to the giants in the diggings under an equivalent gravity head of 400 to 500 feet.

Foster & Gunnell of Grant's Pass, who

are developing the Oregon Belle mine of Forest creek, will build a 10-stamp mill.

J. T. Breedon has leased and will operate the Nunan hydraulic mines of Forest creek, near Grants Pass. These mines cover 150 acres of placer ground. The water rights supply the diggings through two ditches, one giving 280 and the other 580-foot pressure.

The Sylvanite G. M. Co. has been incorporated at Portland by J. T. Walls, Washington; T. Daniels, H. L. Pittock, F. J. Conway, Nampa, Idaho; J. R. Neill, Sumpter; B. C. Ely and A. L. Morris to work mines near Grants Pass.

## SOUTH DAKOTA.

#### Custer County.

The Ivanhoe G. M. Co. will equip its property with a 10-stamp mill, which it is expected to have running before Jan. 1st. Tests are said to have shown the ore to contain platinum in payable quantities, and they will equip the plant for saving this metal as well as the gold. The mine is 8 miles east of Custer.

#### Lawrence County.

Foundations have been started at the millsite of the Globe G. M. Co., west of the Lead City limits, in Whitetail gulch. The plant is expected to be in operation before winter sets in. The mill will have a capacity of 100 tons per day, using two grinding mills in pulverizing, with amalgamation, concentration and cyanidation in recovery of the values. Gasoline engines will supply power. Water for the plant will come from the mine, where on the 500-foot level a sufficient flow for mill work has been opened.

The Eleventh Hour G. M. Co. has been incorporated by W. S. Elder and G. P. Baldwin of Deadwood, J. Madill, C. E. and F. R. Brown. Manager Baldwin says they propose building a cyanide plant and mill at the mine. The property is developed by 2000 feet of cuts and drifts, showing a shoot of cyaniding ore.

President Wibaux of the Clover Leaf M. Co. at Roubaix says he will sink the shaft, now 700 feet deep, to the 1000-foot level. To facilitate the work an auxiliary hoist will be placed at the 700-foot station. A heavy station pump will also be put on this level. The pump has a capacity of 400 gallons per minute.

The report of the Homestake M. Co. at Lead for the fiscal year ending June 1, 1904, shows bullion receipts were \$4,800,558.48. The number of tons of ore milled was 1,299,057, average value per ton \$3.695. (Bullion receipts for the previous year were \$4,526,942.04, and tons milled 1,279,075; average of \$3.539 per ton). In his statement, T. J. Grier, superintendent, says: Development of the mine progressed steadily and satisfactorily. The 1100-foot level reached a year ago in the Ellison shaft has been opened sufficiently to show that the ore vein being worked above that level continues to it, and also holds its width at that depth, while the shaft has been sunk to 1250 feet, where the next level will be opened. The 100-stamp addition to the Amicus mill has been completed. Under head of disbursements are:

Assaying.....	\$ 24,280 43
Six stamp mills.....	744,559 96
Bullion freight.....	7,125 00
Six shafts.....	194,769 69
Two cyanide plants.....	322,919 02
Dead work.....	18,697 00
General and legal expenses.....	27,433 61
Foundry.....	68,194 50
Machine and blacksmith shops.....	10,606 89
Mine, including candles, coal, labor, machinery, oil, etc.....	2,110,182 02

Dividends paid during the year amounted to \$655,200. The greatest item of expense was for labor in the mine, for which the company paid during the year \$1,570,740.60. This does not include items of labor in the various mills and shafts. There was paid out by the company for purchase of property during the period, \$210,168.85; salaries, \$23,200; maintenance of superintendent's house, \$3,934.40; stable, \$29,367.40; survey, \$16,976.24; slimes, \$172.75; tramway, \$27,340.07; taxes, \$78,758.10; timber land, \$300; water, \$65,747.68; wood and timber, \$54,324.89.

#### Pennington County.

The Golden West M. Co., near Rochford, is putting in two Huntington mills. An aerial tramway is being built from mine to mill.

## UTAH.

September in the ore and bullion market closed on settlements aggregating \$2,055,388, compared with \$1,956,912 for September, 1903, says the Tribune, exclusive of settlements made on lead ores by the United States M. Co. The producer was called on during the month to supply the furnaces with 90,000 tons of ore. At the American, at Bingham, the full battery of furnaces is in blast. Adding to the settlements in the open market the value of bullion produced at the independent plants and the total from all

sources is given at \$3,000,000. From the copper furnaces of the valley to the refineries of the East there was forwarded during the month 3,689,336 pounds of copper, gold and silver-bearing bullion of a value of \$1,000,000. During corresponding month last year output of same class of bullion amounted to 2,317,900 pounds. The yield was divided as follows:

	Pounds.
Bingham Con.	1,086,700
Utah Con.	1,510,806
United States.	1,617,740
Total.	3,689,336

In addition to the output from the copper furnaces, there was contained in the matte sent out by the American S. & R. Co. 900,000 pounds, making total from all sources 4,600,000 pounds.

#### Beaver County.

The Wild Bill group, near Milford, owned by the Chicago M. Co., will resume operations—the ores on its dump to be made to supply the means with which to explore the ledge at greater depth. This ore is said to contain 15% lead, 15 ounces silver and about \$3 gold, with 40% iron. It is intended to sink another 100 feet on the ledge.

#### Grand County.

Reports from Basin, in La Sal mountains, says mining deal is being negotiated whereby Denver capital will consolidate the principal mines on Mineral mountain, including the High Ore mine. T. B. Crawford and A. E. Ackerman are interested. The company will run a 2000-foot tunnel into Mineral mountain through the High Ore ground and open up adjacent property, which will include the Skylark group of three claims, the Double Standard, Golden Scepter, Copper Glance, Sunrise, M. I. F., Annie Laurie and Florence mining claims.

Basin reports say J. Welsh, part owner of the Welsh-Lofftus uranium-radium mines, reports experiments show the values of the ore, including the uranium and vanadium contents, can be profitably extracted and that they will put up a plant at Radium, near Basin, next spring.

C. Reagan of Telluride, Colo., is negotiating for a lease on the Basin stamp mill at Basin, which will start up. He will add a concentrating table and cyanide tanks to the present 5-stamp mill. He expects to work the Tornado, M. Y. F., Anaconda and Grouse Mountain ores.

#### Iron County.

The Bullion Canyon M. & M. Co., near Parowan, is again at work and increasing development. The California company that is developing the Canfield property in that section is also at work.

#### San Juan County.

At Eureka the rebuilding of the Uncle Sam shaft house which was destroyed by fire September 24 is in progress, and Superintendent C. C. Griggs says the hoisting plant will be ready for use by October 25. The boilers were found in good condition and the engine also stood the fire in good shape, but will have to be refitted with fixtures. The timbers in the shaft were burned down about 40 feet. While the new plant is going up the company will do considerable work on the tunnel level taking out ore to run the mill. Besides the mill, revenue is being derived from four sets of lessees in the Humbug ground.

#### Salt Lake County.

The aerial tramway, to transport the output of the Galena mines at Bingham to the lead furnaces of the United States smelter, will be completed this month, says Chief Engineer Lyon. All material is on the ground. The towers are going up. The length of the tramway, which will extend from the Galena shaft to the headhouse on the Old Jordan division, is 1656 feet.

In Bingham the driving of a tunnel will be started by the Utah-Apex M. Co. The adit will cut under the mineral-bearing portions of the Apex property at a vertical depth of 1000 feet, and on the dip about twice that amount. It will drain the mine of water and enable the economic handling of the ores, says Manager Orem. Machine drills will be put in. The tunnel will start from the Carr Fork side and will be 2000 feet in length.

Surveying for the aerial tram over which the milling ores of the Continental mines at Alta will pass to the concentrator in Tanner's Flat is in progress and raising of the towers started, says Manager Crowther. The tramway will be 5 miles long. Surveying for the power line has been completed and 4000 feet of pipe will be placed, while at the millsite lumber is on the ground.

The rails of the Copper Belt Railway will be extended to at least two more of Bingham's producers, says Manager W. Bayley at Salt Lake City. The Utah-Apex and the Bingham & New Haven are said to be preparing for rail shipments. The latter has had under consideration building of a tramway, over which

to forward its output to a connection with the Yampa branch on the Copper Belt, says Treasurer Farnum of New Haven, Conn. Sixty tons are going from it daily to the smelter.

Superintendent A. O. Jacobson of the Columbus Con. mine at Alta reports that, with the exception of the delayed transformer and motors, all the equipment for the new mill is set up, and it is expected the plant can be placed in operation next week. The electric coils, which burned out during the recent storm in Little Cottonwood canyon, have been replaced.

#### Summit County.

The Woodside mine at Park City is closed down.

An addition to the Daly-West mill at Park City is being built. It will contain six concentrating tables and one Huntington mill.

The buildings at the mouth of the Corona shaft, where the work was done last winter, have been taken down and rebuilt at the new tunnel site at bottom of Marsac hill. Superintendent Hasson says the tunnel will be 1000 feet in length. He expects to put in a steam plant and an air compressor.

#### Tooele County.

A deal for bonding of the Midas mine and mill in Deep Creek district, near Ibapah, to G. Georgetta is pending, says Manager Chipman of Salt Lake City.

## FOREIGN.

### AFRICA.

The Transvaal Chamber of Mines at Johannesburg reports the gold output for August a total of 312,277 fine ounces, being 301,112 ounces from the Witwatersrand, an increase of 2288 ounces over July, and 11,164 ounces from outside districts, an increase of 2149 ounces over July.—The Chamber of Mines also reports the following as to labor on the Rand:

Natives distributed to mines during August	
by Native Labor Association.....	6,178
Time expired and other wastage.....	7,624
Net loss during August.....	1,446
Total number employed, end of August.....	65,848
Natives allotted to railways.....	514
Chinese employed by members at end of July.	4,947

### AUSTRALIA.

#### New South Wales.

Sydney reports give the gold yield of New South Wales for the month of August at 14,271 ounces, valued at £54,520, as compared with 14,636 ounces, valued at £53,149, in August, 1903. The yield for eight months of 1904 to September 1st aggregates 210,487 ounces, valued at £753,832, as compared with 176,441 ounces, valued at £647,087, for eight months of 1903.

#### Queensland.

The output of the gold mines of Queensland for the month of August is reported at:

District.	Tons.	Crushed.	Yield.
Charters Towers.....	20,300		20,600
Croydon.....	5,400		3,300
Gympie.....	17,900		10,100
Mount Morgan.....	21,800		11,100
Evenswood.....	3,400		1,700
Other fields.....	2,300		2,300
Alluvial.....			1,400
Total.....			52,500

## BRITISH COLUMBIA.

#### Boundary District.

The Montreal & Boston Con. M. & S. Co. is shipping ore to the company's smelter at Boundary Falls at rate of 300 tons per day. Retimbering and widening the Brooklyn incline shaft is completed. At the Stemwinder men are building the new gallow frame. Until the air compressor has been placed, the Brooklyn group, by arrangement with the Granby Co., will buy sufficient air to operate five or six drills. The work of stripping and preparing the Rawhide, another of the Brooklyn group, but a half mile distant, is progressing.

#### Rossland District.

Le Roi No. 2 M. Co. has bonded for \$30,000 the Evening-Eureka group of claims on Red mountain, near Rossland, and will start development work this week. The property comprises four claims and fractions. The Evening group is west of the California mine and south-west of the Giant. The Vernon and Evening claims adjoin the California. The Eureka is a full claim farther west and crossing the gulch between Red and Spokane mountains. The principal work has been done on the Evening. The group is accessible by wagon road and is near the main line of the Red Mountain Railroad.

Concentration operations at the Velvet-Portland mine at Rossland having proved successful, the London directors have authorized doubling the capacity of the works. The plant handles fifty tons of ore daily by straight water concentration. Ground for foundations was broken when

the present mill was built. The company has concentrates said to aggregate \$10,000 in value stored at the mill, and will market this product as soon as snow falls.—Milling has been resumed at the White Bear concentrator, where a shortage of water necessitated a shutdown. Water from the mine will be used for the present, and a permanent supply will be obtained from the forks of Little Sheep creek, to which a flume is being built.

#### Slocan District.

It is reported that the Great Northern Railway will put in a plant at Kaslo for separation and concentration of lead and zinc ores.

At Sandon W. J. Sutton of Victoria will reopen the Noble Five and adjoining properties. Equipment will be put in.

#### Vancouver Island.

Alberni reports state the Alberni Consolidated gold-copper mine will again be worked.

An aerial tramway extending from the mines of the Britannia C. Co., near Vancouver, to the reduction works on the seashore is being built. The towers are up, with the foundation for the terminals nearing completion. In construction of the plant progress is being made. Managing Director G. H. Robinson of Salt Lake City, Utah, says reduction of copper, gold and silver-bearing ore will begin in November. The tramway is 3 miles in length. There are about 100 men at work.

#### West Kootenay District.

In the Lardeau district the mill and concentrator of the Great Western M. Ltd., at Three Mile near Ferguson, is treating ore of the Nettie L.—The management of the Triune mine will continue operations all winter with fifteen men. Provisions and supplies for six months have been taken in to the mine. At the end of August a shipment of 349 sacks of high-grade ore was made to the smelter, and a further shipment of 330 sacks made last week.—Ore is being shipped by pack train from the Old Gold mine on the Duncan road to Ferguson. The mine is owned by the Con. M. & S. Co. Ltd.

## CANADA.

#### Ontario.

The Department of Trade and Commerce reports, at Bannockburn, a company proposes to take advantage of the Lead Bounty Act. A smelter has been erected at Bannockburn and a considerable quantity of lead is awaiting the report of the government inspector, so that the company may claim the bounty. The British Columbia lead producers induced the Government to grant the bounty. Deposits of lead are said to exist in Ontario and Quebec. These could not be worked in competition with the British Columbia deposits, as they contained only lead, while the western ore carries a percentage of gold and silver. It appears that the Government bounty will offset the precious alloy of the western lead.—The Carter White Lead Co. of Chicago, Ill., and Omaha, Neb., is establishing a factory at Toronto, says the News. The company will have a lead corroding plant and will, it is said, utilize British Columbia ore.

The Canadian C. Co. of New York, operating at Sudbury and at Copper Cliff, reports its increased metallurgical plant at Copper Cliff nearly finished. The ore from the company's mines is nickeliferous chalcopyrite, with pyrrhotite gangue, occurring in lenses. It is said to average 2.75% copper and 2.5% nickel. A high-grade matte is produced which is shipped to the refinery, where the nickel and copper are separated and electrolytic copper produced. The company's annual production is about 6,000,000 pounds of copper and 4,000,000 pounds of nickel. R. G. Leckie is manager.

#### Yakon Territory.

Three waterways to be used in connection with mining operations are about completed at Gold hill, near Dawson. All will be finished before the freezeup. The Acklen ditch will be the longest and the other two are both on Bonanza, one being known as the Palmer ditch and the other as the Norwood. On the Palmer ditch the water is taken from Bonanza creek at 55 above, where a dam is located by which the flow at all stages can be regulated, and follows down the left limit of Bonanza to a point opposite Gold hill, the locality on which the water is to be used. The excavating has been comparatively easy, but little rock work being struck that necessitated blasting. The ditch is 4 feet wide on the bottom and 2½ feet deep on the outer edge. Seventy-five men and from fourteen to sixteen teams have been employed on the work for several weeks. From the end of the ditch on the hill back of the forks the water is conveyed across Bonanza creek by means of an inverted siphon of steel pipe.

## JAPAN.

A hydro-electric plant will be built on the Kosaka copper mine at Kosakamura, Rikuchu. An 850 H. P. water turbine to operate on a 104-foot head and to be direct connected to an electric generator, is among the machinery required. The mines are owned by the Fujiti Gumi, with F. Kuhara and K. Taketa, managers.

## MEXICO.

#### Chihuahua.

E. M. Ray, manager of the Pinos Altos M. Co., operating mines at Pinos Altos, says the company will put in a reduction plant, including cyanide equipment. It is also said an electric plant to furnish power for the mines is proposed. Water power for developing electric power to the extent of 2500 H. P. is said to exist within 15 miles of Pinos Altos.

P. Ginther, manager of the Encinillas Mines, Ltd., at Santa Rosalia, says he will increase the size of the plant at Santa Rosalia another 200 tons daily capacity, making a total of 300 tons. The plant will do custom work as well as treat ores from the company's mines, 60 miles east of Santa Rosalia.

It is said J. G. Hardy, manager of the Dolores mine at Dolores, west of Minaca, will build a cyanide plant.

M. Agullera, vice-president and manager of the Cia Minera de Venecia y Roma del Parral, reports the company's mine, near Parral, is yielding ore that assays 48 kilograms (1500 ounces) of silver and 40 grams of gold. P. de Celis of Mexico City is president of the company. The mine is 3 miles from Parral and 3 miles from the Mexican Central Railroad and comprises 154 pertenencias. Fifty-four pertenencias are in the Venecia group and 100 in the Roma group in Balleza.

The Premier Exp. & Dev. Syndicate, Ltd., has been organized in London, England, by H. G. Ricardo of Gatcombe, Glos., T. Symington of Glasgow and S. Berry of London, with A. Searle of London secretary. The company has concessions covering several thousand acres of mineral lands near Parral, in the State of Sinaloa. W. P. Guthridge is resident manager at Parral.

At Carrizo, from the sulphur reduction works, Manager E. F. White says sulphur is shipped to the dynamite works at Colton. There are sixty men employed in assorting and working the dumps at the mine. The ore shipped and reduced each day yields about one ton of commercial sulphur. Joining the above mine is the claim belonging to the Dynamite Co., under superintendency of E. F. White.

#### Durango.

Transfer of the Gavilanes mine of Durango has been made by the E. M. Bind Exploration Co. of Torreon to the Gavilanes M. & M. Co. A 20-ton mill with concentrator was put in a year ago. There will be increase in development of the property. A mill site will be prepared for a plant that will handle 500 tons of ore a day.

At Tomaco the Mexico-Pacific G. & S. M. Co. has ten properties which it is preparing to work as soon as machinery arrives. The company has bought 4500 acres of timber land for use of mines. A. B. Garrett is president.

#### Guerrero.

Work will be started next week unwaterring the Gallo mine, an antigua silver property at Coahuayutla, by the Gallo M. Co. of Mexico. Development work is in charge of R. James, of London, Eng., who with J. G. Fort et al. of London has organized the Gallo M. Co.

#### Jalisco.

The Santo Domingo mine of the Amparo M. Co. of Philadelphia, Pa., near Etzatlan, is producing an average of fifty carloads of ore per month, shipped to the Mapimi smelter. Additional machinery including a reduction plant are going in. E. J. Callahan is superintendent.

#### Lower California.

The Morgan smelter, built in San Diego, Cal., and which belonged to the San Diego S. & R. Co., has been dismantled to be shipped to Lower California, and will be put up at San Domingo for treatment of ores of the mines of G. P. Brown and the Esperanza M. Co.

#### Mexico.

El Oro M. & R. Co., at El Oro, reports for month ending Aug. 31, mill ran 29 days, crushed 9613 tons; produced from 100-stamp mill, \$109,800; produced from cyanide plant, \$22,111; working expenses and development, \$68,486. Profit from railway for month was \$400. There has been expended \$52,348 in permanent improvements, including \$50,182 on new mill.

#### Nuevo Leon.

B. P. Buchard and A. L. Fernandez of Monterey have bought a group of mines

east of La Ventura, and will equip the same with machinery for development.

#### San Luis Potosi.

The Monterey News says Treasurer V. Ferrino and Manager M. Martinez, of the Compania Explotadora de Zinc, have started development of a group of mines which produce zinc. Carbonate ores are being taken out for shipment from San Salvador in La Ventura district of San Luis Potosi. Shipments will probably be made to Swansea, Wales.

#### Sinaloa.

At the Dura mine F. Aragon, of Cosala, is putting in machinery for a concentrating plant and hoisting works.

The San Fernando G. M. Co., C. W. Pritchett manager, is putting in machinery at its mines at San Fernando. The machinery is for enlargement of the reduction plant.

#### Sonora.

The Gold Coin P. & Dev. Co., L. Ginger of Colorado Springs, Colo., president, will increase machinery equipment of its mines in Sonora.

J. L. Giroux of Los Angeles, Cal., owner of the Sultana mine at Copete, will build a reduction plant. The main shaft is down 1050 feet, opening up ore to its full depth. The ore carries copper, gold and silver.

Pumping machinery and pipe are being put in at the Bacanora mine, 3 miles from Las Chispas, near Arizpe, by W. H. Colburn and R. J. Verner. A stamp mill has been built and 140 men are at work.

#### Queretaro.

O. and T. Braniff will increase development of their mining properties at Cadereytas and will put in additional machinery equipment. They have organized the Braniff M. & S. Co., and report \$500,000 gold will be expended in development work. A wagon road will be built from the mining camp through the Cadereytas to Bernal, a station on the National railway. The length of the road will be 40 miles. A concentrating plant will be erected at Maconi with initial capacity of 200 tons—the ultimate capacity will, however, be 500 tons daily. Considerable cableway work will also be carried out. E. A. H. Tays will be resident engineer in charge of development work.

#### Zacatecas.

The Alma M. & M. Co. of Los Angeles, Cal., operating at Nieves, has its 100-ton concentrating plant running on ore from the dump. The company is building a 50-ton smelter. Two hundred men are at work. P. B. McCabe of Los Angeles, Cal., is president.

W. C. Carpenter et al. of Torrington, Mass., are unwaterring the Santa Rita mine, near Nieves. The shaft is being enlarged to a double compartment.

## NEW ZEALAND.

The gold returns of New Zealand for the month of August amounted to 46,773 ounces, valued at £178,624, as compared with 30,074 ounces, valued at £110,572, for August, 1903.

## SWEDEN.

The Swedish Board of Trade reports the quantity and value of minerals extracted during last year were:

	Metric Tons.	Value.
Iron ore.....	3,677,841	16,626,381
Silver and lead ore.....	9,792	191,005
Copper ore.....	36,687	331,725
Zinc ore.....	62,927	2,233,681
Manganese ore.....	2,344	36,550
Pyrites of iron.....	7,793	46,000

\*Krona = \$0.27.  
Increase over preceding year is shown except in manganese ore. The output of coal in 1903 was 320,390 metric tons, as against 304,733 metric tons in 1902. The refractory clay deposits, which are worked in connection with the extraction of coal, produced 172,718 metric tons of clay.

## Trade Treatises.

Fourth Edition Catalogue No. 14, from the Risdon Iron Works, San Francisco, Cal., illustrates and describes in detail the Johnston concentrator.

Catalogues 1018 and 1020 from the Atlas Car & Mfg. Co., Cleveland, Ohio, illustrate and describe in detail their many makes of mine cars, skips, turntables, trucks, switches, etc.

The largest and finest trade treatise received this week is entitled "Lidgerwood Cableways." It is from the Lidgerwood Mfg. Co., 96 Liberty St., New York City, and contains 160 pages, 9x11½ inches, handsomely portraying the numerous styles of cableway transportation put in by the Lidgerwood Mfg. Co. in various parts of the world and in as many different forms of industrial activity. The catalogue is a creditable and comprehensive work.

## Personal.

W. E. DEFTY will be in Montana during October.

E. O. C. ORD is manager of the Pittsburg mine, near Nevada City, Cal.

A. I. GOODELL has assumed charge of Le Roi smelter at Northport, Wash.

C. A. BROCKINGTON is manager of the Orleans M. Co., near Grass Valley, Cal.

J. F. BRANDES returned to Denver, Colo., last week from a ten months' visit in Europe.

H. O. GRANBERG is manager of the Anchora mine at Copperton, near Dillon, Wyoming.

L. R. POUNDSTONE has resigned as superintendent of the Gaston mine at Gaston, Cal.

H. WAYNE is assayer for the Mariposa C. & M. Co. at the Princeton mine, Mount Bullion, Cal.

GRANT FORD is electrical engineer for the Velardena M. & S. Co., at Velardena, Durango, Mex.

R. HEATH is foreman of the Bamberger-DeLamar mine at De Lamar, Lincoln county, Nev.

R. E. WALSH is manager and superintendent of the Black Oak G. M. Co., operating at Angels, Cal.

J. SMITH is superintendent of the mines of the Black Hills & Denver G. M. Co., near Rollinsville, Colo.

J. H. MORELAND has been appointed assayer to the U. S. Surveyor of Customs at Kansas City, Kansas.

E. TRUXALL, of Pittsburg, Pa., is president of the Truxall Con. M. & T. Co., operating at Dumont, Colo.

W. B. ALBERTSON is assistant superintendent of the Clover Creek Cinnabar Co., northeast of Redding, Cal.

C. T. ARKINS, recently of Denver, Colo., is superintendent of the Horseshoe mill at Kalgoorlie, Western Australia.

K. SOPER is superintendent of the Union M. & Exp. Co., operating the Modoc mine, near Central City, Colo.

M. H. FRENCH is manager of the Black Hills & Denver G. M. Co., operating in Boulder Park near Rollinsville, Colo.

ALBERT C. CALKINS of the Calkins Co., Los Angeles, Cal., has returned from a business visit to San Francisco, Cal.

LEE COCHRANE, of the Mine & Smelter Supply Co., Denver, Colo., is in San Francisco, Cal., en route to Portland, Or.

F. I. CAIRNS, formerly connected with Montana copper smelter, is manager of the Michigan S. Co., near Houghton, Mich.

E. L. YOUNG is underground superintendent of the Gladstone mine of the Hazel G. M. Co. at French Gulch, Shasta county, Cal.

J. MACDONALD, general superintendent of the Treadwell mines, on Douglas island, Alaska, has gone East, to be absent several months.

F. M. FLYNN has resigned as assistant superintendent at the smelter of the Cia. Metallurgica de Torreon, at Torreon, Durango, Mex.

F. M. MILLER of Grass Valley, Cal., is superintendent of the Gaston mine at Gaston, Nevada county, Cal., vice L. R. Poundstone, resigned.

H. N. SIMS, formerly manager of the Sun & Moon mine at Idaho Springs, Colo., is with the Traveler's G. M. Co., at Atlantic City, Fremont county, Wyo.

R. P. NOBLE, recently of the University of Chicago, at Chicago, Ill., has been appointed professor of chemistry in the New Mexico School of Mines, at Socorro, N. Mex.

C. E. BRAINARD has resigned as metallurgical engineer of the N. A. Furnace Co. and assumed charge of the mining department of Fairbanks, Morse & Co., Chicago, Ill.

E. H. BENJAMIN, secretary California State Miners' Association, has returned to San Francisco, Cal., from St. Louis, Mo., where he was on the jury of awards, in the World's Fair.

R. E. LYMAN has resumed his position as professor of civil engineering at the University of Utah, Salt Lake City, Utah, after a two-years' leave of absence for advanced study in the East.

L. W. TRUMBULL, E. M., of the University of Wyoming, Laramie, is examining placer property in the Medicine Bow

mountains, preparatory to the installation of dredgers and sluices.

F. A. BRISTOL, recently manager of the Jupiter and Simmer West mines, on the Rand, is manager of the Robinson Deep G. M. Co., Ltd., at Johannesburg, South Africa, vice W. J. S. Stubbs.

D. GILLIES has resigned as superintendent of the Pittsburg & Montana C. Co., at Butte, Mont., and has gone to Tonopah, Nev., as manager of the Montana-Tonopah M. Co.

R. RILEY, recently superintendent of the Vine Spring mine in Tuolumne county, Cal., has been appointed superintendent of the Mountain Maid mine, near Nevada City, Cal.

W. WATSON, manager of the South Rose Deep, Ltd., mine on the Rand, is manager of the Jupiter and Simmer & Jack West mines, near Johannesburg, South Africa, vice F. A. Bristol, resigned.

ASSISTANT SUPERINTENDENT R. A. KINZIE is in charge of operations at the Treadwell mines at Treadwell, Douglas Island, Alaska, during the absence of Superintendent J. A. MacDonald, who has gone East.

G. F. COLLINS, who has extensive acquaintance throughout the East among officials and engineers of large railroad and steel companies, has recently entered the employ of the Allis-Chalmers Co. as special representative at their New York office.

## Commercial Paragraphs.

THE Brown Corliss Engine Co. of Corliss, Wis., have shipped a large compressor to the J. I. Case Plow Works, Racine, Wis.

THE Burt Manufacturing Co. of Akron, Ohio, have recently sent six oil filters to supply their trade at St. Petersburg, Russia, and twenty-seven oil filters and exhaust heads to their agency at Genoa, Italy, as well as a shipment of twelve exhaust heads and three oil filters to their agency at Malmo, Sweden.

THE Jeaneville Iron Works Co., Denver branch, reports shipments of compound condensing mine pump, high lift, to Park City, Utah; one improved Jeaneville sinker to Cripple Creek; one sinker to Durango, Colo.; one to Boulder, Colo.; one sinker to local dealers; one station pump to Silverton, Colo., and one station pump to Wyoming.

SPENCER MILLER, chief engineer of the Lidgerwood Manufacturing Co. of New York City, has returned from St. Petersburg, Russia, where he went by request of the Russian Government to inspect ten Lidgerwood marine cableways which had been installed upon the ten largest battleships and cruisers of the Baltic fleet, known, however, in Russia as the second Pacific squadron, the sailing of which has been announced this week.

ERNEST H. SIMONDS, assayer and chemist of San Francisco, and Lochiel M. King, recently superintendent for the American S. & R. Co. at Oakland, Cal., have formed a partnership as metallurgical engineers, assayers and chemists. The new firm will continue the former's practice and retain the offices and laboratory of Mr. Simonds at 417 Montgomery street, San Francisco, Cal., and in addition will engage in general practice as metallurgical engineers.

THE Union Gas Engine Co. of San Francisco, Cal., is building a 125 H. P. 3-cylinder marine engine and a complete electric light plant for Williams, Dimond & Co. of San Francisco, to be installed in a German ship. This company is also building an 85 H. P. heavy duty engine, and a 20 H. P. stationary gas engine, both fitted to run on crude oil, for the Mine & Smelter Supply Co. of Salt Lake City, Utah. These engines to be used by the Pfau G. M. & R. Co. of Cherry Creek, Ariz.

The Power & Mining Machinery Co. of Cudahy, Wis., have a contract from the Western Gas & Fuel Co. for one 2-cylinder American-Crossley gas engine, 28x36 inches, single acting; speed 130 revolutions per minute; normal brake H. P., 510; maximum, 570; direct connected to two Ingersoll-Sergeant 14x36-inch single-acting compressors; cylinders located in tandem to the gas cylinders to be used for compressing gas entering the cylinders at an initial pressure of 50 pounds, and discharging at 350 pounds. The gas will enter the compressor cylinder at the end nearest the gas engine and will pass through the piston inlet valve to the other side on the forward stroke of the engine, compressing on the return stroke. This construction permits of minimum

clearance in the compressing end of the cylinder and at the same time effectually prevents any chance of leakage of gas into the room; any leakage past the piston, as will be seen, returns to the inlet side. The company's guarantees cover the gas consumption of the engine when operating at rated load, at 500 brake H. P., at which load they have guaranteed a gas consumption of 114 cubic feet of natural gas having a calorific value of 1000 British thermal units per cubic foot. They have further guaranteed that with 1000 cubic feet of gas used in the gas engines of this value 36,480 cubic feet of gas per minute, measured at atmospheric pressure, will be delivered. Gas pumping plants in Indiana and Ohio are now reported using practically 25% of the output of the wells for pumping. It is stated that the plant to be installed by the Power & Machinery Co. will do the work on 34%.

## Latest Market Reports.

SAN FRANCISCO, October 7, 1904.

### METALS.

SILVER.—Per oz., Troy: London, 26½d (standard ounce, 925 fine); New York, bar silver, 57½c, refined (1000 fine); San Francisco, 57½c; Mexican dollars, 47c San Francisco, 46c New York.

COPPER.—New York: Standard, \$12.87½; Lake, 1 to 3 casks, \$13.00; electrolytic, 1 to 3 casks, \$12.85; Casting, 1 to 3 casks, \$12.75; San Francisco: \$15.00. Mill copper plates, \$17.00; bars, 18@24c. London: £58 10s 6d spot per ton.

LEAD.—New York, \$4.30; Salt Lake City, \$3.50; St. Louis, \$4.12½. San Francisco, \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½c; pig, \$4.85. London: £11 10s 9d long ton.

SPELTHER.—New York, \$5.20; St. Louis, \$5.00; London, £22 15s 3d; San Francisco, ton lots, 6½c; 100-lb. lots, 7c.

TIN.—New York, pig, \$28.25@28.50; San Francisco, ton lots, 29c; 500 lbs., 29½c; 200 lbs., 30c; less, 31c; bar tin, \$32½@35c. London, £129 5s spot.

PLATINUM.—San Francisco, crude, \$18.50 per oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75 @ 82c per gram.

QUICKSILVER.—New York, \$42.00@44.00, large lots; London, £7 15s San Francisco, local, \$41.50@42.50 per flask of 75 lbs.; Denver, \$45.00. Export, \$41.50@42.50.

BARBIT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 31½c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 18½c; San Francisco, Plumbers', 100-lb. lots, 16c.

ZINC.—Metallic, chemically pure, ½ lb., 50c; dust, ½ lb., 10c; sulphate, ½ lb., .04c.

NICKEL.—New York, 40@47c ½ lb.; ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 31@34c.

### STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$12.75 @12.85; gray forge, \$12.00; San Francisco, bar, 3c ½ lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$23.00@23.00; open hearth billets, \$23.00 @23.00; San Francisco, bar, 7c to 12c ½ lb.

### CHICAGO CURRENT QUOTATIONS.

LUMBER.—(Retail): Pine, ordinary

sizes, \$24.00@25.00; extra sizes higher: redwood, \$28.00@30.00; lath, 4 feet, \$4.50 @5.00; pickets, \$21.00; shingles, \$2.50 for No. 1 and \$2.25 for No. 2; shakes, \$13.50 for split and \$15.00 for sawed; rustic, \$28.00 @35.00.

NAILS.—This week the basic prices are: Wire, \$2.77; Cut, \$3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, \$3.35; Cut, \$3.55; 10d to 16d, Wire, \$3.45; Cut, \$3.35; 8d Wire, \$3.50; Cut, \$3.50; 6d and 7d, Wire, \$3.60; Cut, \$3.60; 4 and 5d, Wire, \$3.70; Cut, \$3.70; 3d, Wire, \$3.85; Cut, \$3.85; 2d, Wire, \$4.10; Cut, \$4.10. Special rates for car-load lots.

LIME.—Santa Cruz, \$1.25 country, \$1.25 city ½ bbl.

CEMENT.—Imported, \$2.15@2.65 ½ bbl.; California carload lots, \$2.10 f. o. b. at works; small lots, \$2.40 ½ bbl. in sacks, 4 sacks to bbl., 10c for each sack returned.

### GENERAL SUPPLIES.

ANTIMONY.—New York, Cookson's, 7c; Hallett's, 6½c; San Francisco, 1000-lb. lots, 8c; 300@500-lbs., 8½c; 100-lb. lots, 10½c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1½, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1\*\* 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9c; less than one ton, 11c. No. 2\*\* 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2.00 per keg.

CAPS.—3x, \$5.50@6 per 1000; 4x, \$6.50 @7; 5x, \$8@8.50; Lion, \$9@9.50, in lots not less than 1000.

FUSE.—Triple tape, \$4.00 per 1000 feet; double tape, \$3.50; single tape, \$3.10; Hemp, \$2.75; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11½c per set; 14 oz., 40s., 10c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 23@24c ½ lb.; carloads, 23@24c; in tins, 30c; soda ash, \$2.00 ½ lb. 100 lbs.; hyposulphite of soda, 3@3½c per lb.; caustic soda, in drums, 3@3½c ½ lb.; Cal. s. soda, bbls., \$1.20@1.40 100 lbs.; sks., \$1.05; chlorate of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2½c; powdered sulphur, 2@3c; flour sulphur, French, 3½@3½c; alum, \$2.00@2.25; California refined, 1½@2c; sulphide of iron, 8c ½ lb.; copper sulphate, 5½@5½c; chloride of lime, spot, \$2.50@2.75; sulphuric acid, in carboys, 66% B, 1½@2c ½ lb.; nitric acid, carboys, 8c ½ lb.

OILS.—Linseed, boiled, bbl., 53c; cs., 58c; raw, bbl., 51c; cs., 56c; Lucol oil boiled, bbl., 50c; cs., 55c; raw, bbl., 48c; cs., 53c. Kerosene—Pearl, per gal., 19½c; Astral, 19½c; Star, 19½c; Extra Star, 24c; Ecocene, 23c; Elaine, 26c; Water White, in bulk, 13c; Mineral Seal, iron bbls., 18c; wooden bbls., 20½c; cs., 24c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22½c; 86° Gasoline, bulk, 25c; do., cs., 31c; 88° Naphtha or Benzine, deodorized, in bulk, per gal., 13c; do., in cs., 19½c; Lard Oil, E. W. S., bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Sperm, crude, 63@68c; Natural White, 63c; Bleached, do., 57c; Whale Oil, cs., 52@57c.

ALUMINUM.—No. 1, 99%, small lots, 37c ½ lb.; 100 lbs., 35c; 1000 lbs., 34c; ton lots and over, 33c; Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

BORAX.—Concentrated, 6@7c ½ lb.; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

BONE ASH.—Extra No. 1, 5@6c ½ lb., No. 1, 4@5c.

RED LEAD.—500 lbs. and over at one purchase, ½ lb., 7c; less than 500 lbs., 7½c. LITHARGE.—Pure, in 25-lb. bags, 8@9c ½ lb.

MOLYBDENUM.—Best, \$2.75 ½ lb.

CHROMIUM.—90% and over, ½ lb., 80c.

PHOSPHORUS.—American, ½ lb., 70c.

SILVER.—Chloride, ½ oz., 90c@1.00; nitrate, 55c.

MERCURY.—Bichloride, ½ lb., 77c.

MAGNESIUM.—Pure, N. Y., 60c.

MANGANESE.—½ lb., \$2.75.

SODIUM.—Metal, ½ lb., 50c.

BISMUTH.—Subnitrate, ½ lb., \$2.10.

URANIUM.—Oxide, ½ lb., \$3.50.

FIRE BRICK.—Domestic, carloads per 1000, f. o. b., factory square, \$25.00; soap and split, \$22.50; arch and wedge, \$27.50; skewback, \$30.00; circle, \$32.00.

FIRE CLAY.—Domestic, per ton 2000 lbs. in 125-lb. bags, double and dry ground, f. o. b., factory, \$8.50.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

### Dividends.

Bunker Hill & Sullivan M. & C. Co., dividend No. 84 of \$75,000; payable Oct. 4.

## New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR THE WEEK ENDING SEPTEMBER 27, 1904.

- 771,114.—TELEPHONE SWITCH—Audriano & Herbst, S. F.  
 770,841.—EDUCATIONAL CONCENTRATOR—J. F. Barker, Los Angeles, Cal.  
 770,953.—RULE HOLDER—W. O. Bell, Soldiers' Home, Cal.  
 771,030.—BED—F. W. Boecker, Oakland, Cal.  
 770,957.—FRUIT PITTER—J. S. Briggs, Los Angeles, Cal.  
 771,121.—JAR CLOSURE—W. E. Brown, Los Angeles, Cal.  
 771,122.—BOTTLE—F. A. Busse, Alameda, Cal.  
 771,128.—HYGIENIC MOUTHPIECE—H. L. Cutter, Los Angeles, Cal.  
 770,898.—STEAM GENERATOR—I. T. Danks, Fresno, Cal.  
 770,747.—POSTOFFICE BOX—W. & M. H. Folsom, Pilotrock, Or.  
 771,005.—PUMP HEAD—S. M. Fulton, Pomona, Cal.  
 771,205.—DRILL—F. P. Hepler, Crescent City, Cal.  
 771,070.—MUFFLER—W. J. Hewitt, Del Monte, Cal.  
 770,857.—GUIDE SHEAVE—Hollenbeck & Palmer, S. F.  
 770,858.—TROLLING SPOON—R. C. Hornung, S. F.  
 771,016.—AXLE CUTTER—Ingram & Stickney, Sacramento, Cal.  
 770,072.—PUZZLE—E. G. Jackson, S. F.  
 771,153.—HOUSE CONSTRUCTION—W. C. James, Cucamonga, Cal.  
 771,154.—HOUSE CONSTRUCTION—W. C. James, Cucamonga, Cal.  
 770,969.—REFRIGERATOR—E. Johns, Puyallup, Wash.  
 770,758.—ROAD GATE—H. Kirch, Santa Rosa, Cal.  
 770,804.—GUIDE—ZITHER—M. Kolander, S. F.  
 771,165.—CANE AND STOOL—Manderson & Coombs, Seattle, Wash.  
 770,866.—PUMP—R. J. Mullin, Seattle, Wash.  
 770,868.—HARROW TOOTH—J. Porteous, Fresno, Cal.  
 771,308.—GAGE COCK—J. W. C. Prochnow, Flagstaff, Ariz.  
 771,010.—GAME TABLE—P. J. Sausen, Seattle, Wash.  
 771,108.—HOIST—S. T. Wallace, Los Angeles, Cal.  
 770,881.—PLANE—J. Weyland, Los Angeles, Cal.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

GUIDE SHEAVE FOR HOISTING APPARATUS.—No. 770,857. Sept. 27, 1904. J. W. Hollenbeck and Wm. E. Palmer, San Francisco, Cal. This invention relates to a guide sheave for hoisting and like ropes and means for adjusting said sheave to the varying directions of travel of the ropes. It consists in a support from which each sheave is suspended and about which it is turnable in conformity with varying movements of the rope. The object of the invention is to provide what is known as a "guy" or guiding sheave over which the rope passes, with a means for automatically adjusting it to the varying changes of the rope as it is caused to swing from side to side, this sheave being placed at some point between the winding drum and the outer connections of the ropes.

TROLLING SPOON.—No. 770,858. Sept. 27, 1904. R. C. Hornung, San Francisco, Cal. The object of this invention is to provide a lure or decoy of simple construction which will generally simulate the movements and characteristics of such fish as are preyed upon by other fish and which will maintain such simulation whether the trolling boat moves fast or slow through the water. The invention comprises a trolling spoon generally oblong in appearance with curved symmetrical ends, a portion of the spoon intermediate of its ends having oppositely upturned edges and essentially ogee in form in the direction of its width.

## The Promoter in Mining.

That the promoter is a necessary adjunct to the growth of the mining industry seems an established fact. The prospector goes into the mountains to search for mineral, finds it, and locates the government land upon which the mineral is found. He is usually a man of little—often of no means. He seldom comes individually in touch with the capitalist whom he expects eventually will buy and operate the mine which he has found and commenced to develop. The promoter is really nothing more nor less than a broker who carries on negotiations (with greater or less success and profit to himself) between the claim owner and the person or persons who buy, equip and operate his mine. The promoter has as much a place in the economies of modern mining as the prospector or the capitalist, and has become an important factor in the industry. There are, however, a number of grades of promoters—high grade, low grade and base. A first-class promoter will deal only in what he considers “gilt edged” properties—those having actual merit, and the development of which shows values somewhere near the price asked for the property. He makes mine promotion and brokerage his business, and having once done business with wealthy clients treats them in such a manner that he can at any time do business with them again. He is careful in his selection of property for disposal to his clients, careful to state facts only, and careful not to take so large a commission as to result in his being unable to do further business with the buyer should information of its amount come to his knowledge. There is another type of promoter who takes a good prospect, and “promotes” it by organizing a company with a capital stock running into the millions of dollars, and sells stock to those who are willing to draw 20% per annum on this inflated valuation. His prospectus is not characterized by the moderation of its statements, but is couched in language which every practical miner recognizes at once as the work of the novice at everything connected with mining, and the prospectus as the height of artistic and conscienceless lying. A third class of promoter needs nothing better than a prospect hole, with or without ore, upon which to base statements calculated to trap the unwary into investing in the stock of the wildcat concern. The inexperienced are unable to distinguish the bona fide from the “fake” scheme, and many invest their savings only to lose them. Instances of this character are of frequent occurrence.

Although this class of promotions is of frequent occurrence and the complaint of those who have been

Santa Ysabel Hoist, Quartz Mountain, Stent, Cal. (See Page 257).

Santa Ysabel Mill on Quartz Mountain, Stent, Cal. (See Page 257).

The App Mine, at Quartz Mountain, Mother Lode, Tuolumne County, Cal. (See Page 257.)

“taken in” in their desire to “get rich quick” is equally frequent and loud, yet the honest promotion of legitimate mining enterprises is successfully continued and will continue, for the integrity of the men engaged in this latter class of promotion is a sufficient guarantee of the character of the proposition offered. The most successful operators are those who carefully select good mines, equip and further develop them, place them on a paying basis and then sell them to the investing public at a price commensurate with the actual value of the property. In this case the buyers, through the agents or brokers, become themselves promoters. It is something along these lines that some of the largest and most successful mining operations of recent years have been promoted, and, without doubt, the method is an excellent one, fruitful of good results and worthy of emulation by others engaged in the promotion of mining properties great and small. There are many engaged in this business of acting as an agent or broker between the mine owner and capitalist, and fair dealing will do more to promote confidence in legitimate mining than anything else, for there are always those who are willing to take a reasonable risk if they feel confident they are not to be robbed, for no one likes to contemplate being fleeced.

## The Labor Situation.

From the mining States come at present little reports of labor difficulties. Strikes are on in only a few unimportant localities, but there are in some directions expressions of fear of a renewal of strife between mine operators and the Western Federation. In the Lake Superior copper region the agitators of the Western Federation are quietly at work endeavoring to get a following among the miners of that region, but thus far only a few of the weaker element have joined. For years the mines of the Lake have run successfully and peacefully, and the miners appear satisfied. Many of them own their homes and conditions are satisfactory to the sober-minded and industrious workmen.

In the Black Hills of South Dakota the Federation dominates everything except the Homestake mine. At Lead City is a powerful local union, but its officers are steady men of brains and experience. During the twenty-seven years of their existence the Lead City Miners' Union has never had a serious disagreement with the Homestake Company, which shows that under wise counsel labor unions can exist and thrive when the right kind of men are at the helm. At Leadville, Colo., the Western Federation has succeeded in securing an injunction against the Mine Operators' Association, enjoining them from discriminating against Federation men. It is said over 2000 operators' cards have been issued. What advantage is derived from this injunction of the court it is difficult to see. Leadville has had a peaceful career during the past eight years, and the district is more prosperous than at any time within a decade, and all interested in the success of the mining industry there regret to see the clouds of dissension arise. It is probable, however, that the prompt action of the Mine Owners' Association in anticipating trouble will have a deterrent effect. At Cripple Creek the mines are operating smoothly and the outlook for a peaceful continuance of these conditions through the approaching winter is good at present. In California there are heard occasional reports of threatened trouble, but nothing of a serious nature has occurred there for several months. In the Great Basin region there are no troubles worthy of mention at this time, miners and owners alike being too busily engaged in the development of the mineral resources of the country to stop to argue over wage rates, hours or other conditions of employment. In New South Wales, Australia, several large mines have recently been closed owing to demands of organized labor, the management of the mines declaring that to meet these demands would result in running the mines at a loss. These troubles are thus far confined to the Lloyd and Cobar copper mines. At the Lloyd mines the result of operations was becoming discouraging and the manager prepared a sliding scale of wages depending upon the financial result of operations. This was submitted to the men. It provided that if during a month's run the mine did not pay, the men's wages should be reduced, but if the following or any subsequent month the mine showed a profit the wages should be advanced accordingly. Also if at the end of the year there was a profit the men should receive a certain pro rata as a reward for the risk they had taken. The miners admitted the eminent fairness of the proposition, but the wood choppers refused to agree. The arbitration court suggested that the men accept the reduced wage rate until the court could examine into the matter and determine upon its merits, but the union declined to accept the suggestion, and as a consequence the mine was closed down, throwing 1500 men out of employment. The obstinate wood cutters are in the minority—350 in number—and it is they who are the most seriously affected. At the Great Cobar mines the union has submitted a new scale of wages and conditions of employment. The demand contemplated an increase on the existing scale of 42%. As at the Lloyd mine, the miners are apparently willing to let well enough alone, evidently realizing that the company may close the mine, but the officers of the union insist upon the terms as set forth in the official demand. There are 1300 men employed at the Great Cobar mines, and it is said that 5000 people will be directly or indirectly affected by the closing of the mines. It is merely another evidence of what can be accomplished by professional labor agitators. It is stated

that rather than be dragged into the prolonged and expensive litigation incident to a hearing before the Judicial Arbitration Court the directors will close the mines.

## Pioneers in Mining.

The object which men have in view when locating new mining claims is, primarily, the making of money—making it in some indefinite, unforeseen way, and in larger amount than would be possible by the slow process of working for a stipulated daily wage, and saving each day a portion of their earnings, no matter how small. The average prospector is willing to face uncertainty and endure hardship and privation, but the idea of building up a fortune by the practice of self-denial and long-continued patience is almost unknown to him. He may subsist upon plain and sometimes scant food, but his outdoor life and hard work make him strong and healthy and self-reliant, and he lives in the future. He goes out on his search for a fortune with a light heart, and with optimistic faith in his own ability to win it from the rocks. This is written of the real prospector—he who actively engages in the business and work of looking for new veins and deposits of ore, but does not apply to so great an extent to another class who might, perhaps, better be styled "locators"—a class of men who rush precipitately into a newly discovered district and locate everything in sight, taking advantage of the result of the pioneer work of the prospector who made the first discovery. The aim of the first is to find a new deposit of mineral, develop and work, or sell it, and thereby secure the long-hoped-for competency. The aim of the other is to secure all the ground he can which he hopes he may be able to sell to his own advantage to some one who desires to emulate in a measure the real prospector by mining in search of pay rock. The prospector of the first class is necessary to the development and extension of the mining industry. He of the second class is inevitable. He, too, is useful, but not to so great an extent as the pioneer prospector, who has nothing but his knowledge, gained of experience, to guide him. The second fellow has the way paved for him, and although entitled to less than the former, he often gets as much or more. He is in evidence in every attractive and rich camp, and doubtless he will be as enduring as the other, for to a great extent the mining laws give him the same privileges and opportunities as his brother, the pioneer, and seeing this he often takes more.

ANOTHER large ore body of gold rock is reported discovered on Breece hill, at Leadville, Colo. This new find was made some time since, but has been kept quiet while development progressed. The new find is in the porphyry, and is similar to the Antioch, Ibex, Resurrection and other gold deposits back of the city of Leadville. Although mining has been vigorously prosecuted for twenty-seven years in Leadville, new and important strikes of large ore bodies continue to be reported. The most noted among these are the recent development of sulphide ore on the Coronado mine, under the town of Leadville, the strike of carbonate and chloride ore on Rock hill, south of town, and now this find of siliceous gold ore on the mountain east of the city. These several strikes will do much to stimulate prospecting in that camp, and it is highly improbable that all of the ore deposits are known. There still remains a large area of undeveloped territory on the range back of Leadville, and what may exist under the western part of town is entirely speculative, while development has seldom, if ever, been carried below the lowest known ore-bearing limestone, although there appears to be great possibilities in the underlying quartzites of the Cambrian.

ANOTHER large electric installation in the mountains of California has been planned to furnish power to the mining and other industries. The plan, it is said, involves driving a tunnel nearly 3 miles in length, which will make available a water power of 500 cubic feet per second, developing 15,000 horse power. This new company, it is stated, has bought the privileges of the Fort Miller Company, organized in 1900. Fort Miller is the name of a small fortification, now in ruins, situated a few miles above the village of Pollasky, east of Fresno, and on the banks of the San Joaquin river.

THE statement in some detail appearing elsewhere herein of the cost of producing copper in Tennessee is of interest for the purpose of comparison with the cost of similar operations in the mines of the West and elsewhere. The cost, \$3.08 per ton of ore treated, is lower than at most places in the Western States. In this regard it is to be remembered that wages are lower in Tennessee than in the West, or abroad.

THE inventive genius of numerous experimenters in the treatment of gold ores by the cyanide process is being directed toward an improvement in filter pressing which will lessen the time required to charge and discharge the presses and at the same time, if possible, to secure a lower percentage of moisture in the cakes, and decreasing the cost of operation. In view of this fact, some innovations in filter press practice and possibly in the construction of these machines may be anticipated.

THE thirteenth annual session of the California Miners' Association will meet in San Francisco, Cal., on December 5-8, 1904. It is proposed that the morning sessions shall be devoted to the reading of papers on practical mining subjects by experienced men, being somewhat of an extension of the innovation made in the two preceding annual conventions of the Association. A further idea of the program as outlined is to have the afternoons of each day given to excursions of local interest. The California State Miners' Association has had an honorable and fairly successful existence and is possessed of much deserved prestige. It has done considerable for mining and is capable of continuing such work. The annual sessions have always been seasons of pleasure and mutual profit, and the forthcoming convention will doubtless be no exception to the general rule.

## CONCENTRATES.

"CHEMICALLY PURE LEAD" can be had from any dealer in assay supplies, but would cost more than its ordinary use would warrant.

GRAPHITE is a good lubricant for the hot crank pin. The questioner might also try a mixture of nine parts valve oil and one part white lead.

THE fibrous talc sent is coarse, of short fiber and hence of little value. That substance, when of suitable structure, is used by makers of paper and dynamite.

IF distance and transportation prevent hauling to the chlorination plant, the iron sulphate can be made right at the mine from scrap iron, sulphuric acid and water.

IN beginning the development of a placer mine, it is desirable, where possible, to have the main sluices in the open air, rather than in a tunnel, though the latter is permissible when necessary.

MANY large quartz veins show a cross fracture extending at approximately right angles to the walls and extending from wall to wall. This cross fracture is sometimes mistaken for dip when the walls of the vein are not visible.

IN many instances where leather or rubber does not make a satisfactory gasket, sheet lead may be used as a substitute. This is particularly applicable to cases where steam pipes are frequently connected and disconnected, as about a mine pump.

THE longest tunnel in the world is the Simplon, recently completed. It passes through the Swiss Alps, joining Switzerland and Italy, and is 12 miles 1374 feet in length. The St. Gothard is  $9\frac{1}{2}$  miles long, the Mount Cenis 8 miles and the Arlberg  $6\frac{1}{2}$  miles.

CALIFORNIA is the principal State producing magnesite. It is found in abundance in a number of counties, notably in Alameda, Santa Clara, Tulare and Napa, and in smaller amount in many others. The magnesite used east of the Rocky mountains is mostly imported from Greece.

GRANITE and rhyolite belong to the same rock family, granite being the plutonic, deep-seated rock and rhyolite the eruptive, volcanic equivalent. In the same way, yenite represents a deep-seated rock and trachyte its effusive equivalent. Diorite is a deep-seated intrusive rock and andesite its volcanic equivalent.

WHEN designing cyanide or other tanks it is well to remember that timbers and lumber are cut standard lengths, and it is economy to make the size of the tanks such that they will conform as nearly as possible with the standard sizes of timbers and lumber. Thus it is inadvisable to figure on timbers 12 feet 4 inches when the standard sizes are 12 feet and 14 feet.

IN the event of a mineral vein extending into railroad land, if the railroad has not received a patent for the section in question, it is still open to location as mineral land, the same as the adjoining even numbered sections. No mineral is reserved to the railroad company. It is only by taking out a patent for the land before the mineral is discovered and claimed that the railroad companies can hold mineral land.

ASSESSMENT WORK which has been neglected on mining claims during 1904 may be held by the claimants beginning work on the claim before Jan. 1, 1905, and continuing the work until \$100 worth of work shall have been accomplished or improvements made. Some claim holders begin their work in October or November and do \$100 worth of work, and continue into the succeeding year, when they do an additional \$100 worth. By this arrangement they are required to visit the claim only once in two years instead of yearly. If an amount of work be done in excess of the legal requirement during any one year, it does not count on the assessment work required the following year. It is true that in saving a claim from relocation a claim holder may begin the work for 1904 late in that year and finish it in 1905, but he may not do work for 1905 in 1904.

WHERE A buys a one-half interest in an unpatented mining claim from B, and B fails to do his share of assessment work, A cannot relocate all or any part of the claim for himself alone as against B, but A may do all of the necessary assessment work; and then if B refuses to pay his proportion of its cost, A may "advertise Bout," as provided by law. The extension of any claim is subject to location at any time if not already taken, and a discovery of mineral-bearing rock in place can be made on it. Aside from the necessity of making a new discovery on a first location, the acts to be performed in relocating a claim are the same as those followed in making an original location. In relocating, a new discovery is not necessary, and assessment work may be performed in a shaft or other excavation already made,

but the full amount of new work required by law must be performed.

IT is improbable that assays of country rock taken at a distance from a vein are a reliable basis for the supposition that the minerals of the vein were derived from the walls by "lateral secretion." It seems more probable that the minerals found in the country rock at a distance from the vein came from the same sources as the minerals in the vein itself, and reached their present position by slowly infiltrating waters coming up from below through a fissure or zone of fracture and permeating the country rock. Often the mineralization nearest the vein or fissure is more pronounced than at a distance from it, thus indicating the manner of formation of the deposit. The Bunker Hill & Sullivan ore deposit in the Coeur d'Alene district of Idaho is an example of this condition.

RUNNING GROUND may usually be passed through by carrying "breast boards," top and side lagging and employing "false sets" to help sustain the heavy ground. If the ground be very wet, better headway is sometimes made by allowing it to drain. This makes the ground firmer and decreases the tendency to run. No one should be permitted to attempt this class of mining work but experienced men, for, by improper timbering or other faulty work, the entire length of drift in the running ground may be lost. The water should be carried away in a pipe or box, thus keeping the floor as free from water as possible. Swelling ground rarely gives trouble when first cut. It is after being exposed to the air several days or weeks that the rock begins to "swell," and its force is almost irresistible, and can only be safely handled by cutting away the ground forced into the workings and removing it in a car. If the floor of the drift raises, the track must be torn up, if necessary, and the raising ground cut down to proper level. This may have to be repeated many times before the swelling of the ground ceases to be troublesome. If it continues after several months of cutting away and it is necessary to keep the workings open, it were better to drive a lateral drift in the hard foot or hanging wall, until the bad ground is passed. If the walls adjacent to a pay shoot swell, remove the ore as rapidly as possible and allow the workings to close up.

DIORITE is one of the most common intrusive rocks. Its essential constituents are hornblende, quartz and plagioclase feldspar (the feldspar may be variable—usually oligoclase, sometimes andesite, labradorite or anorthite). Mica, pyroxene and occasionally orthoclase are present, but not essential. Magnetite is more or less abundant. The rock varies in texture according as the mass is large or small. In large masses it is generally comparatively coarse in texture, in small dikes fine grained (aphanite). Diorite is usually named in accordance with prominent constituents by the use of descriptive terms as mica-diorite in a diorite where mica is abundant. Diorite-porphyrity is a diorite showing phenocrysts. It differs from porphyry, which is a compact rock of orthoclase or orthoclase-quartz mixture. There are diorite-porphyrity, mica-diorite porphyry and diorite-aphanite. The latter term is applied to diorites so fine textured and dense that its constituent minerals cannot be determined with a lens. The greenish color of most diorites (and also of diabase) is due to the alteration of the hornblende, (and in diabase of the augite) to chloritic mineral. All diorites contain more or less magnetite and often titanite. It is these iron ores that give the black varieties their dark color. The blackest diorites usually appear green or grayish-green in thin section. The grano-diorite of the Sierra Nevada mountains of California contain all of the essential constituents of both granite and diorite, as well as a number of accessory minerals.

THERE are two important processes employed in treating matte containing gold and silver—one, the Hunt & Douglas process, the other the Black & Hartman. By the Hunt & Douglas process the matte is roasted at low temperature with the purpose of forming copper sulphate and oxide, without forming at the same time silver sulphate. The roasted matte is then leached with dilute sulphuric acid, the gold, silver and lead remaining in the residue. To the copper solution obtained is added chloride of lime, and the copper precipitated as subchloride by passing sulphurous acid through the solution. This product is reduced to suboxide by addition of milk of lime, the latter forming chloride of lime, which is recovered for reuse, and the suboxide is melted into bars. The Black & Hartman process of recovering gold from matte is said to be similar to that in use at Argo, Colo. The matte is roasted to convert the silver present into sulphate, in which condition it is leachable by water, the silver being precipitated on metallic copper, the gold remaining in the matte. Or, it may be roasted in a reverberatory furnace to black copper, granulated, ground, roasted and leached with salt solution by the Augustin process, and the silver precipitated. The residue containing the copper and gold is then concentrated in a reverberatory furnace until a small amount of copper is extracted, as a copper bottom, carrying nearly all the gold. The subsequent separation of the gold from these copper bottoms is accomplished by a process that has not been divulged by the management at Argo.

A TANK for holding the drainage water of the level of the mine, and also, if desirable, of the levels above it,

may be cut in the solid rock beneath the station floor or under the floor of a drift at one side. It may or may not be necessary to construct a dam of concrete, or of lumber and clay at one end of this excavation, depending upon the ability of the rocks to hold water. As the space beneath the station is usually taken up by ore pockets, it is the better plan to cut the water tank beneath a drift or make an excavation at one side of the station for the tank. This tank should be provided with a good sized pipe, 6 or 8 inches diameter, extending to the shaft, and provided at one end with a simple "clack" valve which tightly closes the entrance to the pipe. This valve is suspended at its upper edge by a hinge attached to the pipe. The latter is cut at an angle of about 45° to its length, so that the valve when closed rests in a sloping position. A stout cord, or piece of bell line, is tied in an eye on the valve, and this cord passed upward over a pulley and thence horizontally to the shaft, where it is made fast, and within easy reach of the skip tender. At the opposite end of the pipe, and adjoining the shaft, the pipe is provided with several feet of canvas pipe bound tightly to the iron pipe. This permits the skip tender to fill the skip by placing the outer end of the canvas hose in the skip and pulling the cord, which raises the valve in the tank. When the skip is full the cord is released and the valve closes automatically. The canvas hose is hung up on a hook and the arrangement gives no further trouble unless the tank overflows, which it is the duty of the skip tender to see does not occur.

THE location of a mill should always be carefully considered before the site is selected, both with reference to delivery of the ore from the mine and to the operations to be performed within and about the mill. One common error is to place the mill so high that ore must be elevated to get it above the crusher floor, or so low that tailings have to be elevated to get them to a point where they will flow away from the mill. Of the two evils the latter is the least desirable. Ore can be elevated if necessary, but it is probably cheaper to lift it dry and in good sized pieces than to lift it in the form of sand with about four or five times its weight of water in addition. When planning a mill consideration must be given the concentration, as well as the crushing problem. It may be necessary to put in hydraulic classifiers and other devices, as well as concentrating machines, and this requires abundant "fall." Then, too, it may be desirable to subsequently treat the tailings by cyanidation or some other process, and this requires forethought and careful planning. In some instances it is cheaper to tram the ore a considerable distance from the mine to a suitable site than to handle it several times at a site near the mine. The method of transportation in such an instance must be determined by surrounding conditions, the amount likely to be moved daily and the relative cost of each of the several methods which may be employed, as well as the cost of installation. There are a number of methods to choose from—tramping by men, by animals, by steam, by electricity and by compressed air, and sending the ore on an aerial tram either by gravity or by power. It is usually desirable and less expensive to crush the ore in rock breakers at the mine and to send the crushed rock by whatever means may be employed to mill, rather than to put rock breakers in the mill and distribute it by tramping. This is particularly the case with a large mill.

IN many head frames are seen more or less complicated devices for dumping skips, both at vertical and inclined shafts. Experience has shown that this can be quickly and safely accomplished by turning the track from the vertical or inclined direction to horizontal at the proper point above the ore bin in the head frame and placing a bumper on this horizontal track. When the skip is raised to the level of the horizontal section of track the upper wheels pass out upon this flat track and the rear or lower wheels would follow but for the forward wheels striking the bumpers which prohibits their moving farther in that direction. The engineer continues to hoist slowly. Then, owing to the peculiar construction of the skips, the rearward wheels and lower end of the skip are lifted upward clear of the track by the side bars, which are attached either to a bar passing under the bottom of the skip, or as is more common, to lugs projecting from heavy plates secured to the sides near the lower end of the skip. When the skip has been overturned to the proper angle the contents will immediately discharge into the bin and the skip is lowered again, the wheels taking the track, the weight of the lower portion being sufficient to cause the upper wheels to run backward on the horizontal track and the skip again descends the shaft. Lugs on the side of the skip and beneath the side bars prevent the skip from overturning backward in the shaft, either going up or down. The side bars should be set below the center of the skip, if above this medial line there is danger of the bottom end being lifted from the rails and the skip overturned in that manner, if there be sufficient room, or otherwise striking the timbers. In shafts approaching the vertical it is better for safety and fast running to provide side guides. These prevent overturning, and in the head frame they may be dispensed with at the proper point. In dumping in the manner above suggested at vertical shafts it is well to provide some device to prevent overwinding, for if the skip be lifted a few inches too high when dumping, the forward wheels are inclined to run backward and cause a portion of the load to be dumped into the shaft.

## Coal in British Columbia.

Written for the MINING AND SCIENTIFIC PRESS by  
W. A. HARRIS.

Up here, near the portal of the Crow's Nest Pass, nature with a lavish hand deposited bituminous coal measures which for thickness and quality are scarcely rivaled anywhere. The development of this potential wealth so essential to the economic progress of a young nation like the Dominion dates back in a relative sense only yesterday. Coleman, where the Dennison colliery of the International Coal & Coke Co. is situated, had no existence a year ago; to-day it gives promise of soon becoming the chief center of the coal and coke industry of the entire district. The transformation has been little short of marvelous. The coal company is rapidly completing the installation of a plant with a capacity to handle an output of 2000 tons of bituminous coal daily. Since last October 30,000 tons of coal have been extracted in the course of development. A fortnight hence, even before the most essential equipment shall have been installed, the colliery will be maintaining an output of 500 tons daily. It is conservatively estimated that the production will reach 1000 tons daily by January 1 next, and 2000 tons per day—the limit of the plant—by May or June next. Thus far the entire output has been sold in advance. To accommodate the growing traffic, the Canadian Pacific Railroad has built 2½ miles of tracks and sidings on the company's property at Coleman. A double battery of 104 coke ovens, capable of producing 140 tons of coke daily, were completed recently, and provision has been made for the erection of 300 additional coke ovens at an early date. A portion of the coking plant is now in operation. It is producing a superior quality of coke, which finds a ready market in the British Columbia smelters.

This, in outline, is the story of the results accomplished at Coleman in less than twelve months. The company employs about 300 men, including mechanics engaged in construction work. A noteworthy feature is the fact that the coal extracted in the course of development has thus far actually paid all costs of development of the mine.

The bituminous coal lands acquired by this company extend about 7 miles north and south on the strike of the coal measures, and south of the railway. The main line of the Crow's Nest branch of the Canadian Pacific Railroad passes within 200 yards of the main entry of the mine. The seams—seven in number—run parallel north and south and are embraced in an area less than 700 feet wide. The croppings can be plainly traced at intervals on the surface for 2 miles north and 5 miles south of the track. The seams have a westerly dip of about 35°, and are regular and in good condition wherever tested. With one exception, they are all east of and under that now known as No. 2, and on which for the present most of the development has been done. No. 1, the most westerly seam, is about 5 feet in thickness; No. 2 is 14 feet; No. 3, which is opened 2 miles away to the southward, is 17 feet; No. 4 is 8 feet and No. 5 about 7 feet. A Pittsburg, Pa., consulting coal mining engineer last year estimated the coal in sight above the water level of the Old Man river at 64,000,000 tons. The coal taken out in development is excellent for steaming purposes, being free from impurities. It runs from 60% to 65% in fixed carbon, and makes a firm coke of good quality.

Development work is being concentrated on No. 2 and No. 4 seams. The main entry and airway driven on No. 2 seam are now in about 2200 feet. This seam is uniform throughout, averaging about 14 feet in thickness. Coal has been extracted from this working daily since the commencement of operations. At a point 1000 feet distant from the pit mouth of the main entry and airway a crosscut was driven at 45° through rock, intersecting No. 3 seam, 150 feet distant, and encountering No. 4 seam 80 feet farther east. The development of No. 3 seam has not yet been undertaken. An entry and airway have been driven south from the crosscut along No. 4 seam for a distance of about 500 feet. This seam is 8 feet in thickness, possesses a good roof and bottom, and in the matter of dip presents the same uniform characteristics as No. 2 seam. The entries on the coal have already opened up a large area of ground. The mine is being developed on the stall and pillar system, with barrier pillars. Later on the crosscut from No. 2 to No. 4 seams will be extended farther east to intersect the three other seams. The face—2000 feet from the portal of No. 2 seam—owing to the gradual rise of the mountain, gives a depth of 400 feet vertically from the surface. A slope now being sunk on No. 2 seam is down 400 feet on the pitch of the seam. Lifts will be made every 300 feet. This will provide rooms 300 feet in length, thus affording a rapid and economical method of development and extraction, combined with safety. Every device known to modern coal mining practice is being utilized. The main system of ore haulage will be compressed air. The workings will be ventilated by a reversible fan 16 feet in diameter, driven by a two-speed 150 H. P. motor, and will furnish 150,000 cubic feet of air per minute. This fan—now being installed on No. 2 seam

at the surface—will be in operation some time during the present month.

The policy of the company is evidenced by the large expenditure in the erection and equipment of the surface works, including the power house and tippie, all of which are nearing completion. These works are situated north of Old Man river and alongside the main line of the railway. The powerhouse—80x82 feet—is a fireproof (stone) structure. It contains six boilers, each of 125 H. P. capacity. The engines—two in number—are each of 400 H. P. capacity. The engines are directly connected with two 250 K.W. electric generators (equivalent to 335 H. P. each), supplied by the Westinghouse Electric Co. of Pittsburgh, Pa. These generators will furnish the electrical current for the various motors to operate the fan, tippie, larries, machine shop, and for the lighting of the town of Coleman. Other machinery equipment comprises a Rand compressor of 1000 pounds pressure for the purpose of furnishing air for the car haulage system throughout the mine. This machine compresses air at the rate of 750 cubic feet per minute.

The tippie—situated at the railway track and 200 yards from the colliery—is the largest affair of the kind in the Crow's Nest district. It has a handling and storage capacity of 4000 tons of coal daily. A steam hoist of 100 H. P. will hoist the cars from the yard in a self-dumping cage 80 feet to the top of the tippie. The coal, after passing over a series of screens, falls upon two picking tables, with a capacity of 100 tons each per hour and driven by a 25 H. P. electric motor. Falling by gravity, it is automatically screened and delivered in bins in the lower floor of the tippie, ready for shipment by rail. The slack coal, previously separated, is delivered into other bins, whence it falls into the larries (cars), which in turn convey it and automatically dump it into the coke ovens, a short distance away. The tippie has a capacity of 2000 tons every ten hours. If worked full time, it will be ample to handle the output of the mine for several years to come. The larries which convey the slack coal to the coke ovens are operated by electricity. The loading of the railway box cars will be effected by means of a car loader located in front of the tippie and alongside the railway track. This device is a great labor saver and prevents breakage of the coal.

The company has also erected machine, blacksmith and woodworking shops. Power furnished by a 25 H. P. electric motor.

At the present rate of development Coleman is destined to become one of the largest and most prosperous towns on the Crow's Nest Railway. The Canadian Pacific Railway is a large consumer of coal, and the wants of thousands of settlers on the prairies for purely domestic purposes are growing, and are likely to tax the productive capacity of many coal mines. A considerable proportion of the output will be converted into coke, for which a ready market is already assured, not only in the smelter towns of British Columbia, but at leading American smelting centers like Great Falls, Butte and Anaconda. The mileage to Montana is not greater than to Boundary smelting points. The plant and equipment, as well as the economical method of mining now in vogue at Coleman, will enable Coleman coal and coke to meet all competitors in the Western markets on both sides of the line.

The president of the International Coal & Coke Co. is A. C. Flumerfelt of Victoria, B. C., who is largely interested in the mining, smelting and lumbering industries. His decision to engage in coal mining was reached only after a careful study of the possibilities of the industry. The general manager and vice-president of the coal company is H. E. Galer, who two months ago resigned the position of assistant general manager of the Granby Consolidated Mining, Smelting & Power Co. to assume the active management of the International Co. at Coleman.

The general superintendent is Edward E. Reynolds, C. E. and M. E., who resigned the office of mine inspector of the seventh district of Pennsylvania, in January last, to enter the service of the International Coal & Coke Co. Since his arrival at Coleman Mr. Reynolds has directed the work of opening up the mine and the construction of the surface works. Mr. Reynolds has been engaged in coal mining since boyhood, filling every position from errand boy to mine manager. He is authority for the statement that the No. 2 seam here is nearly twice the size and of equally good quality as the coal seam in the Connellsville region of Pennsylvania.

## Schistosity and Slaty Cleavage.

"Experiments on Schistosity and Slaty Cleavage" is the title of a bulletin (No. 241) recently published by the United States Geological Survey. The author, G. F. Becker, first published in 1893 a theory of slaty cleavage founded on experiment and analysis. His theory is in contrast to the explanation offered in 1849 by D. Sharpe, which is the one most generally accepted by geologists. Sharpe's theory is that a fracture perpendicular to the line of pressure would run along the flattest faces of the component grains and meet the smallest number of them. This hypothesis implies that the mass is heterogeneous and that adhesion between the component particles is smaller

than the cohesion within the particles. According to Becker's theory, cleavage is due to a weakness of cohesion, antecedent to rupture, on planes of maximum tangential strain, the effects being influenced by viscosity, although the direction is independent of viscosity. These and other disputed theories have been thoroughly tested by Becker, and the results of his experiments are clearly set forth, with appropriate illustrations, in Bulletin No. 241.

Schistosity as a structure is important, and it is part of the business of geologists to explain its origin. Slaty cleavage has further and greater importance as a possible tectonic feature. Scarcely a great mountain range exists along the course of which belts of slaty rock are not found, the dip of the cleavage usually approaching verticality. Are these slaty belts equivalent to minutely distributed step faults of great total throw, or do they indicate compression perpendicular to the cleavage without attendant relative dislocation?

The distinction between Sharpe's theory and Becker's is well defined. If in any portion of the mass before strain a small sphere is supposed to be marked out, this sphere after strain will have become an ellipsoid, called the strain ellipsoid. If Sharpe's theory is correct, the cleavage due to pressure will be in surfaces perpendicular to the smallest axis of the strain ellipsoid. If Becker's theory is correct, the cleavage will make with this smallest axis an acute angle equal to or greater than 45°, and increasing as the strain grows greater. The general nature of the experiments needed to compare the theories is made plain by this contrast. It amounts to a study of the strain ellipsoid.

## Stamp Milling Practice in Nova Scotia.\*

Written by M. R. O'SHAUGHNESSY.

At the request of a number of Nova Scotian gold miners and members of the Mining Society, I submit for their consideration the following notes on Nova Scotian practice in wet crushing stamp mills:

It will be necessary to call attention to the two different types of mills now in use, namely, the light mill, equipped with 650-pound to 700-pound stamps and capable of pulverizing one and a half tons per stamp in twenty-four hours, and the modern heavy high-speed mill, equipped with stamps ranging in weight from 850 pounds to 1100 pounds, capable of pulverizing from two to four tons per stamp in twenty-four hours.

But the question may be asked, How does the heavy mill differ from the light mill in the pulverization of ores and collection of values in gold? A brief description of the practical workings of the two mills will be necessary to demonstrate the relation one mill bears to another.

I will first take up the practical working of the light mill and point out that this mill in general use

A Mortar. B Die. C Shoe. D Stamp-head or boss. E Stamp rod. F Feed opening. G Screen. H Screen opening. I Battery key or key wedge. J Water supply pipe. K Water chamber. L Water jet or nozzle. M Ore under action of stamp. N Gold and heavier particles of ore lying protected about base of die.

previous to the introduction of the modern heavy mill was not, and is not to-day, when intelligently operated, the "old trap" that a great many miners believe it to be. The extraction of gold from our ores depends, with a few exceptions, on the one machine, namely, the stamp mortar with plates, and in all cases where the mill is in an isolated district, the one that appears best adapted to the extraction

\*Abstract Trans. Min. Soc. of Nova Scotia.

of gold is the light stamp and roomy mortar with a capacity of about one and a half tons per stamp in twenty-four hours, hand-fed preferably to automatic, unless a first-class automatic feeder is installed.

Let us assume that the light hand-fed mill is ready for commission, and the writer is in charge preparing for a run. After determining that the thrust of stamps is directly on the dies, the fronts are placed in position, the base of mortar, including dies, is covered thoroughly with sand or pulp recovered from the mortar in a former cleanup, screens are examined, placed in position, and made secure.

One of the most important points in practical stamp milling is the protection of the gold after it has been liberated from the gangue by the action of the stamp. Such being the case, it will be apparent that in order to mill successfully certain rules and regulations will have to be followed in the method of operating in order to secure the desired protection of the gold from the wearing action of the stamps and pulp in the mortar. One of the best methods to obtain this result is to take advantage of the law of gravitation. Gold having extraordinary gravity, all that is necessary to readily take advantage in the light mill of the laws of gravitation, and protect the gold after it is liberated from the ore, is to give strict attention in feeding ore and water during the first few hours' run of the mortar. By close or thin feeding for the first few hours, a stationary base is formed in the mortar. This base is the surface of the solidly packed sand that forms in all the mortars not otherwise fitted with appliances for preventing the stemming and packing of sands around the dies. By careful attention to feeding ore and water it is possible to establish this base from 1 to 2 inches below the crushing surface of the dies, and if care is exercised throughout the run in feeding ore, supplying sufficient water at all times to meet the requirements of the pulverized material, the material within the mortar will be displaced and washed by the action of the stamps to a depth of 2 inches below the crushing surfaces of the dies. One of the apparent advantages of the light mill is due to the easy pulsating motion given the pulp when properly supplied with water and ore. The liquid condition of the pulp allows the different atoms of the ore to find their relative position by gravity, hence the material having the least weight escapes from the mortar first and all particles of greater gravity are retained in the mortar the longest period of time and are reduced to the greatest degree of fineness. In nearly all our Nova Scotian ores gold is closely associated with the sulphides of iron or other minerals which are retained longest in the mortar until almost reduced to slimes, thus liberating a large percentage of gold that owing to prolonged abrasion readily amalgamates. Its weight will readily find it a resting place on the base line of mortar, the crowns of the dies acting as riffles to arrest the particles, whether pure amalgam or sulphurets carrying a percentage of gold.

Any person familiar with the panning motion of the moving pulp in the mortar under displacement by the stamps in the light mill, can readily comprehend the advantage of an abundance of water on the crushing surface of the dies. It materially increases the efficiency of the mill as a pulverizer, by washing out the disintegrated parts of the ore on the surface of the dies when the stamps are not resting thereon. It readily adjusts the pulp uniformly under each stamp, and it is at this stage of the crushing that the millman should see that the base of the mortar is formed at least  $1\frac{1}{2}$  inch below the crushing surface of the dies, and know that at all times sufficient water is being supplied to thoroughly wash the dies after each thrust of the stamps, as the displacing force of the descending stamps is the agency whereby the sand is mechanically displaced alternately from one die to another. It is only necessary to supply sufficient water and feed low or thin, to successfully displace the pulverized material after each thrust of the stamp. Such being the case, the liquid condition of the partly pulverized ore resting on the surface of the dies enables the broken or separated atoms of ore to take advantage of gravitation; and regardless of the agency of mercury, coarse and heavy gold readily falls a prey to the pockets created between the dies for the purpose of its protection after it has been liberated from the ore.

A large percentage of what is termed float-gold that escapes from the mill in the water is created by the action of the stamps reducing the gold to minute particles before the active and expelling force of the stamps is enabled to discharge or lodge them in a place of safety on inside plates. Knowing the soft malleable nature of gold, it is apparent that a large percentage of values escapes from poorly managed mills in the form of worn gold created by continuous exposure to the action of stamps and sands.

It will be apparent to any thoroughly practical, observant millman, that a great many of the difficulties surrounding the extraction and collection of gold in Nova Scotia is created by the very methods applied for the recovery of the values. As a rule, our gold-bearing ores may be considered practically free milling, and a large percentage is coarse and granular gold, which, if protected from wear, is easily recovered by the stamp mill wet crusher. If proper methods for the protection and collection by gravitation in the mortar of the coarse gold so commonly found in our ores, is put in practice, amalgamation

is only necessary for the finer and smaller atoms whose gravity is overcome by the action of stamps and which are expelled from the mortar through the screens. The conditions for early amalgamation are clear liquid and sharp pulp, so apparent in mortars supplied with lower or thin feed, and an abundance of water to carry off the ever recurring slimes. In the majority of our mills the supply of water to the mortar is governed by the flow passing over the stationary plates that were probably placed in position during the construction of the mill in accordance with the practice of an altogether different district. The plates can only be used as an indicator of the proper supply of water required by the mortar, after a series of experiments have been made to determine the required volume, and in all cases it will require adjusting to suit different qualities of ore.

### Royalties in Rhodesia.

The official gazette of the British South African Co. has published a scale of royalties under which mines may be operated in that country. The scale seems to have been devised without regard to the expense of getting the gold. It is a well-known fact that ordinarily the size of the vein is an important factor in the cost of operating a vein, but by the scale of this

## The Desert Dry Lakes of California.

NUMBER VIII.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by  
G. E. BAILEY, E. M.

**USES OF OTHER SALINES.**—It is not necessary to dwell here on the uses of "natural sodas," for soda in its various forms has been a household word to everyone from childhood. Its uses alone in baking powder, soaps, and glass making form such colossal industries that none of its hundreds of other uses need be mentioned. The present value of the borax and sodas of the dry lakes and the unquestionable consumption of the future are alone of such great importance as to demand that immediate steps be taken to protect them, by placing them in a class by themselves; and the existence of other salines with them only intensifies their importance and makes the necessity of proper classification more imperative.

**THE FUTURE.**—In making predictions as to how long a natural resource like timber, placers, borax or soda, etc., will last, one is far more apt to overestimate the number of years than to underestimate. It is difficult to realize how fast a country may grow

Salt Making by Evaporation at Alvarado, Alameda Co., Cal.

Harvesting the Salt Crop in Alameda County, Cal.

company, one who operates a large vein on a small margin of profit but who produces a fair output must pay a larger tax than he who operates a small but rich mine in which the profit per ton is large. Following is the official notice:

"It is hereby notified for public information that the British South African Co. has resolved to grant the following additional facilities for working small propositions to persons, companies and syndicates desiring to work mining locations in their own name or over which they hold an option, lease or tribute agreement from the registered claim holder, without proceeding to flotation. The conditions contained in Sec. 44, Mines and Minerals Ordinance, 1903, whereby working for profit up to 750 tons per month is permitted, will remain in force, but workers of small propositions will have the option of working for profit without limit of stamping power or tonnage per month on payment of royalty on the following basis:

Output per month.	Royalty payable on value of gross gold won.
Up to 750 ounces	2 1/2 per cent
Above 750 ounces and not exceeding 850 ounces	3 1/2 per cent
Above 850 ounces and not exceeding 950 ounces	4 1/2 per cent
Above 950 ounces and not exceeding 1050 ounces	5 1/2 per cent
Above 1050 ounces and not exceeding 1150 ounces	6 1/2 per cent
Above 1150 ounces and not exceeding 1500 ounces	7 1/2 per cent

If the claim holder or holder of an option, lease, or tribute agreement desires to work the claims on a larger basis than 1500 ounces per month, an agreement will have to be entered into with the British South Africa Co. as to its interest in the claims in accordance with the provisions of Secs. 40 and 41 of the Mines and Minerals Ordinance, 1903.

Save as above set out, the provisions of Sec. 44, Mines and Minerals Ordinance, 1903, will apply to small propositions worked for profit under this notice."

and how rapidly a certain consumption may increase.

**SALINES WILL NOT LAST INDEFINITELY.**—One thing certain is that the deposits of salines will not last indefinitely. In 1830, Chili began the exportation of niter with 8340 tons. It took fifty years to increase these imports to the 593,518 tons of 1883, and it was believed that they would last indefinitely; but it took only another ten years for the exports to reach the million mark, or over 1,079,000 tons in 1894; and in 1901 they had increased to nearly a million and a half. The statistics for each year will be found on pages 152 and 153 of Bulletin No. 24 of the California State Mining Bureau. Already steps have been taken to limit the annual production of the niter, and experts predict that the supplies will be exhausted in less than fifty years more.

The borax industry has grown by leaps and bounds, and the natural soda industry is following in its footsteps. Twenty years from now may find the dry lakes of California producing 30,000 tons a month of borax and soda alone, instead of the 3000 tons per month now produced. An increase in the use of these salines is clearly indicated by the domestic nature of the present uses. The dry lakes producing them are found only in California and Nevada, excepting a small area in Oregon. The number of dry lakes is not large, and their total area is comparatively small. The natural supply of the United States is limited to the dry lakes of the Pacific coast. Few other countries possess these natural deposits, and their deposits are of limited extent. The deposits are resources of which both the State and Nation are proud. In view of these facts it is wisdom for those in authority to throw around these deposits such safeguards as will protect them from misuse and waste.

## A Simple Instrument for Mine Surveys.

Written by FRANK ROBBINS.

It may be well to say that no one more keenly appreciates accurate underground surveys and perfect mine plans than the writer; and none is more inclined to condemn loose and inexact work in this direction.

The experience of all of us no doubt—particularly in mine examinations—tends to show that many mines, especially those which are for sale or are in need of examination, have no plans at all; and in cases where plans exist they are frequently not found posted up to date. It may be taken as an axiom that a perfect report can not be made without a plan—that is, of course, unless it be something that can be condemned at a glance and summed up with a terse "No good." This plan must be something to show where samples are taken; where pay shoots begin and where they end; the reference of one level to another and the hundred and one details which will occur to the engineer.

Let us assume an extreme case. A short option is held upon a mine or prospect, situated in a remote mining district of British Columbia; the mine is reached by a mountain trail from the nearest small settlement, 25 miles away, it is 20 miles over a mountain road from the settlement to the nearest small town, from which it is 50 miles of staging to the railway. The clients in Montreal or Toronto have waited till the last minute before sending the engineer out—probably till the snows have set in—and they are now anxiously waiting for the report.

The mine is reached and it is found that the values are variable, lie in rather a flat vein, and consist of more or less irregular shoots or bodies, these have been opened up by several levels, all as crooked as a ram's horn, there are two or three faults, and the owners have no map of the workings. While the engineer is getting warm, an Indian messenger comes in with a wire from Montreal or Toronto telling him that it is important that he hurry his report. A plan is essential—there is no time for an accurate survey with careful closing points. What is wanted is something more than a sketch and something less than the perfectly-constructed plan of the colliery properly conducted. How often do engineers stumble upon just such a case as this? In my practice I find that they are the rule. Perhaps not in British Columbia, where the mine plans are kept up as carefully as the recollection of the catechism.

Some sort of a sketch plan may be prepared with the aid of a pocket compass. I have tried this with an old-fashioned mahogany box compass held in my note book, the sides of the book being used as sights; the needle never settled; I have tried it with a prismatic compass, but my points were never certain. I have carried a heavy transit along on such trips, nursing it carefully, in case of emergency, almost invariably in such a case to find the mine perfectly provided with plans.

In the light of such experiences I hit upon the simple and convenient instrument which gives the title to this paper; with the aid of the accompanying cuts I will endeavor to describe it.

First, I will assume that a compass which may be read to half a degree will come within the bounds of accuracy required. That, when local attraction is manifest, back and fore sights will be taken at every station and the included angle between them read, after the "old country" fashion of "blind dialing." Where attraction does not exist the instrument is to be set up at alternate stations only, and the middle station established by fore and back sights as in the ordinary compass practice; that the bottom plate of the dial have a semi-circle divided thereon, and graduated both ways from the E or W point from 0 to 90°, with a pendulum indicator suspended from the center pin traversing this semi-circle, by which angles of elevation and depression may be taken when the dial is set in a vertical plane.

Many years ago I came into the possession of a pocket compass, which consisted of a flat plate, about 5 inches square, upon which was set a compass dial, with the above pendulum attachment for vertical readings. This compass was provided with two folding sights. It was a good pocket compass. By laying the edge of a square plate upon a wall or upon a ladder, I could read slope angles. By leveling it upon a few rocks and lying down upon my stomach in a wet drift, I could get a bearing through the two sights with a fair degree of accuracy. By holding it in my hands and averaging the run of the needle through its oscillations, I could also usually guess a bearing somewhere within 5°. It struck me that this instrument was susceptible of improvement and that a light tripod to which the compass could be attached would prove a convenience. The tripod was easy enough; the attachment, however, had to be considered. The ordinary ball and socket joint was the first suggestion, but while this would admit of reading to perfection, it would not admit of the taking of readings in the vertical—a sine qua non in all mining instruments, I take it. I happened about this time to run across in an old book of mechanical movements the cut of a universal joint—Goyjot's joint it was called, if my memory serves me—which I

thought would do. This consisted of a square block of metal with a bended plate on top and another underneath, these plates being attached to the block by screws running through the latter, one above the center and one below it and at right angles to each other, thus admitting of the plate C passing through a semi-circular arc at right angles to the axis of the upper screw d. The block E has also a range of movement in arc at right angles to that of C and around its pivot the lower screw d. I made such a joint of wood and sheet brass and saw that it would answer the purpose. I sent this pattern to John Roach (the old instrument maker of San Francisco) who made for me the joint shown in Fig. 1.

A disc is centered and braced to the bottom of the compass; into this disc a female screw is tapped. A shows a male screw corresponding to this and by which the compass and milled headed disc B are attached to each other. B is attached but not fixed to the bent plate C by means of another screw passing through a hole in C, and threaded into B. Thus B with the compass attached may be turned in any direction upon the surface of C. See Fig. 2.

The bent plate C is attached to the block E by screw d passing through E but not fixed to it. The tension of the screw is sufficient to hold C in any position of its range of movement. The bent plate F is attached to block E in the same way and E has a range of movement at right angles to that of C. The bent plate F is fixed to the hollow spindle G which is screwed to the solid spindle of a simple tripod. It will be evident from Figs. 2 and 3 that not only can the instrument be leveled for horizontal observation, but it can also be turned into a truly vertical plane for dip readings with its pendulum clinometer.

In the position shown in Fig. 3 it is evident that an offset (equal to the distance from the point of sight—usually taken at the end of the sights near the compass box—to the center of the top of the block E) is

made between the positions of the instrument in horizontal and vertical sights. The compass center is coincident with the center of block E when the instrument is set for horizontal reading. Correction may be made for this offset, practically the same as for transits with parallel telescopes; but the error is so small that, with the limitations of the instrument, it may be disregarded.

With the above described joint and a light tripod, it will be seen that I now had an instrument which was stable and by which I could take angles of elevation and depression and also horizontal ones within the range of sight possible between the top and bottom of the two folding sights, in fact in this last respect having the same range of service as the land surveyor's plain compass. But as bearings have to be taken down steep inclines something further was necessary. This was hit upon in the expedient shown in Fig. 4 and consists of a pair of sights with a peep hole in one and a round opening with cross-hairs in the other; the construction of this admits of sliding it either way upon either of the folding sights of the compass—usually over the open or fore sight.

With this attachment in place it is possible by raising or lowering the folding sight to which it is attached to look down any depression or up any elevation.

Fig. 5 shows the application of this attachment to a sight down an incline.

In practice it is usual to take the bearing of the incline first and to establish the point, if underground, by a candle; the instrument is then turned over as in Fig. 3 and the angle of dip taken to the same candle, and this recorded, with, or without, the correction for the difference between the centers of the instrument in the two positions.

When the instrument is in use the slide sight is usually left attached to it; when not, it is detached and dropped into the pocket. In fact the whole instrument—with exception of the tripod, and even that with the legs off, can easily be accommodated in an ordinary coat pocket.

Knocking about in out of the way places and packing one's belongings on horse or mule back every ounce counts and every cubic inch becomes an incumbrance, hence a tripod between 4 and 5 feet in length does not add to the comfort of a trip. As the legs of the one for this little compass were light they could be easily replaced; so I took to leaving them behind, depending upon the country and a jack-knife to furnish a new set, but sometimes "hitting the high places," sticks were not easily obtainable, and I came to the conclusion that some kind of light extension tripod was a thing to be desired. A mine carpenter and a mine blacksmith between them constructed the device shown in Fig. 6 and it has proved a useful tool ever since and has never been obtrusive in the pack. It is not material whether the lower part of a tripod leg slides into the upper, as is usual, or lies along side as it does in this.

The construction is as follows: A strip of hard wood about 1 inch wide (depending upon the sockets of the tripod head) and 1½ inch deep, a trifle shorter than the ordinary tripod leg, is cut in two. Each half is then ripped through the major part of its length, say to within 3 inches of each end; the slit is enlarged to about ⅜ inch, it is on the deep side and as accurately as possible in the middle of this. The two pieces are of equal rectangular section, that is, they do not taper, except the lower one, which at the end is trimmed to a point and tipped with iron. Two brass screws with square heads and thumb screws are fitted to each pair of pieces. These screws couple each pair together through the long slot and by means of them the tripod legs can be extended to their full length for use or reduced to the length of a roll of blankets.

I have had the simple instrument above described in use now for a good many years and it is still in perfect condition. The attachment of the bent plates C and F to the block E by the screws d appears to be the only weak point; but these parts have not worked loose and the screws have always preserved the necessary tension to keep the surfaces in sufficiently close contact for the purpose required.

The only improvement which suggests itself is that a larger compass could be substituted for the small one I use, and that it have levels which mine has not. A pocket Vernier compass with 3½-inch needle would be admirable, if the pendulum clinometer were added to it.

With such an instrument as this in such a case as I have cited, the traverse could be run and the notes platted and the examination finished in less time than it would take to send word to the railway that a transit was needed; and for the purposes of examination and report, the plan would be quite as good as one made to minutes by a careful man with a high-class mining transit.

THE fineness of placer gold varies greatly in different regions, and often in the different gulches of the same region. It is a curious fact that placer gold appears to improve in fineness or grade as it gains distance from its original source. The gold in a placer mine is usually higher in grade than the gold of the vein from which it came. The grade and appearance of gold in the ancient rivers of California is often of assistance in identifying the several channels.

The Genesis of the Diamond.\*

NUMBER II

Written by GARDNER F. WILLIAMS.

There is conclusive proof that the diamonds in the South African mines were not formed in their original place of crystallization, as, for example, the frequent occurrence of broken crystals imbedded in the hard kimberlite. The geological strata of the rocks which surround the diamond-bearing pipes of the Kimberley district are shown in Fig. 2.

Concerning the discussion of the genesis of the diamond, Sir Isaac Newton's opinion was that it was of vegetable origin and combustible; but it was not until 1694 that the combustibility of the diamond was actually proved by the famous burning glass experiment of the academicians of Cimento.

Lavoisier, Guyton de Morveau and others determined that the diamond was converted into carbonic dioxide by burning. The experiments of Sir Humphry Davy, in 1816, showed that the diamond was

like a coal, but in reality intensely cold, escaped into the palm of my hand from the strong iron vessel in which, with a pressure of fifty atmospheres, he had liquefied carbonic acid gas—the very gas resulting from the combustion of the diamond." \* \* \* "In the carbonic acid gas generated from the carbonaceous shales by heat, and interspersed as bubbles in the cavities of the viscid, ferruginous amygdaloid and in the admixture of steam, lava and ashes known as the 'Kimberley blue,' reduced to the liquid state by the enormous pressure in the subaqueous volcano, we have the constituents of the diamond in a form admitting of crystallization, and the subsequent absorption of its oxygen by the iron always present in its containing walls during long intermittent periods of volcanic activity."

In this presentation Dr. Atherstone dogmatically puts the carbonic acid gas evolved from the carbonaceous shales into the cavities of the amygdaloid (presumably the melaphyre, which is the only one of the encasing rocks of the volcanic pipes, that is amygdaloidal). This gas is then reduced by pressure to a liquid state, in which form, as he thought, the carbon admitted of crystallization. He then absorbed the oxygen of the carbonic acid by the iron in the containing walls of the craters. As the melaphyre existed before the volcanoes burst through it, it is more than probable that the cavities, which existed in it at the time it was erupted, were filled with agate and calcite, which they now contain, before the diamond-bearing ground was forced up through it. If the theory above given had any foundation in fact, one of two results must have happened, viz., either the resultant diamonds would have been enclosed in the amygdaloidal rock, or the diamonds must be formed in the "blue" in their perfect state. Both of these assumptions are contrary to facts. As to the derivation of the necessary carbon from the carbonaceous shales surrounding the mines, it will be made clear subsequently that this assumption is not justified.

Professor Lewis alleged that the diamond is the result of the intrusion of igneous rocks into and through the carbonaceous shales. He says:

Perhaps the most interesting chemical observation concerning the blue ground was that made by Sir H. E. Roscoe. He found that on treating it with hot water an aromatic hydrocarbon could be extracted. By digesting the blue ground with ether, and allowing the solution to evaporate, this hydrocarbon was separated and found to be crystalline, strongly aromatic, volatile, burning with a smoky flame and melting at 50° C.

That the rock was a true lava, and not a mud or ash, is indicated by the fact that the minerals and their associations are those characteristic of eruptive ultra-basic rocks.

Professor Lewis further says:

The kimberlite is shared by no other terrestrial rock. In structure it resembles meteorites of similar composition. If the ground mass of kimberlite were replaced by native iron, it would be nearly allied in both structure and composition with meteorites known as chondrites."

The Ava meteorite, which fell in Hungary in 1846, contained graphite in cubic crystalline form, which Gustav Rose thought was produced by the transformation of diamonds. Later Weinschenk found transparent crystals (diamonds) in the Ava meteorite. Minute diamond crystals and graphite were found in the meteorites from Canyon Diablo, Arizona.

Professor Lewis advanced the theory that probably the diamond came from the hydrocarbon which was contained in the fragments of carbonaceous shales distributed through the blue ground, but the inclusion of carbonaceous shales in the blue ground can hardly be reconciled with Professor Lewis' conclusion "that the rock was a true lava."

Professor Molengraaff, formerly State Mineralogist to the South African Republic, discusses the genesis of the diamond, and says that the theory of the formation of diamonds during the ascension of the blue ground from carbon borrowed from the carbonaceous shales was, in his opinion, weak.

In the Pretorian beds, as well as in the formations underlying these, strata containing any notable quantities of carbon were nowhere to be found in the Transvaal, so that the conclusion might safely be drawn that the igneous blue ground, in forcing its way from great depths towards the place where it was found, could not borrow any carbon from the surrounding strata in order to convert it into diamonds.

In Bohemia a rock occurs which contains every

mineral known in the blue ground of Kimberley, except diamonds. On my visit to the Mining Academy at Freiberg, Saxony, a few years ago, Dr. Stelzner, professor of geology, showed me two cases containing these minerals, and in every instance the Bohemian minerals corresponded with those from Kimberley, except that the case of Kimberley minerals contained a few small diamonds which had been presented to the Academy.

Both the aqueous and igneous theories of the origin of the kimberlite have had able supporters, among the former being Stanislas Meunier, M. Chaper, and later Professor Garnier and Sir William Crookes. The igneous theory is strongly supported by Professors Lewis, Molengraaff and Stelzner. My own opinion is that the aqueous theory is the less assailable.

Concerning the origin of the blue ground, assuming that it is not the original matrix of the diamond, I find the following weak points in the igneous theory:

1. As already observed, it is impossible to account by the igneous theory for the water-worn boulders found in the blue ground.

2. The experiments of Herr W. Luzi of Leipsic, in the production of artificial figures of corrosion upon the surfaces of rough diamonds, are most interesting in the light which they throw on the crystallization and the probable matrix and genesis of the diamond. Until lately the only appearance of corrosion upon the surface of rough diamonds was the regular, triangular negative pyramids which were produced through heating the diamond in the open air or under an oxygen flame.

Herr Luzi discovered that the breccia (kimberlite) from the South African mines, when in a molten condition, possesses the property of absorbing the diamond or of changing its shape. He describes his experiment as follows:

A small quantity of the blue ground was melted in a crucible placed in a Fourquignon-Leclercq furnace at a temperature of 1770° R., which was the highest temperature attainable. A diamond with perfectly smooth natural faces was submerged in this molten mass. A further quantity of blue ground was added to the contents of the crucible until it was completely filled. A tightly fitting cover was placed on the crucible, which was again exposed for thirty minutes to the greatest heat attainable. When the crucible was cooled the diamond was removed and found to be covered with irregular oval and half round grooves of various depths. In one experiment the diamond was found to be deeply eaten away on one side.

Some of these partly absorbed diamonds upon which Herr Luzi experimented are deposited in the mineralogical museum of the Leipsic University.

The Mother Lode in Tuolumne County, California.\*

NUMBER IV.

Written for the MINING AND SCIENTIFIC PRESS by W. H. STORMS.

On the north end of Quartz mountain are the App and Heslep mines, which have been worked almost continuously the past ten years, and which were among the first mines to be opened on the mother lode in this county. In its early history the App mine was distinguished by having three pay shoots in the quartz occurring in the ankerite of the lode. In depth these three shoots (which were separated by from 40 to 60 feet of barren ground) united and formed a single shoot about 250 feet in length. In these shoots the gold was distributed with remarkable regularity.

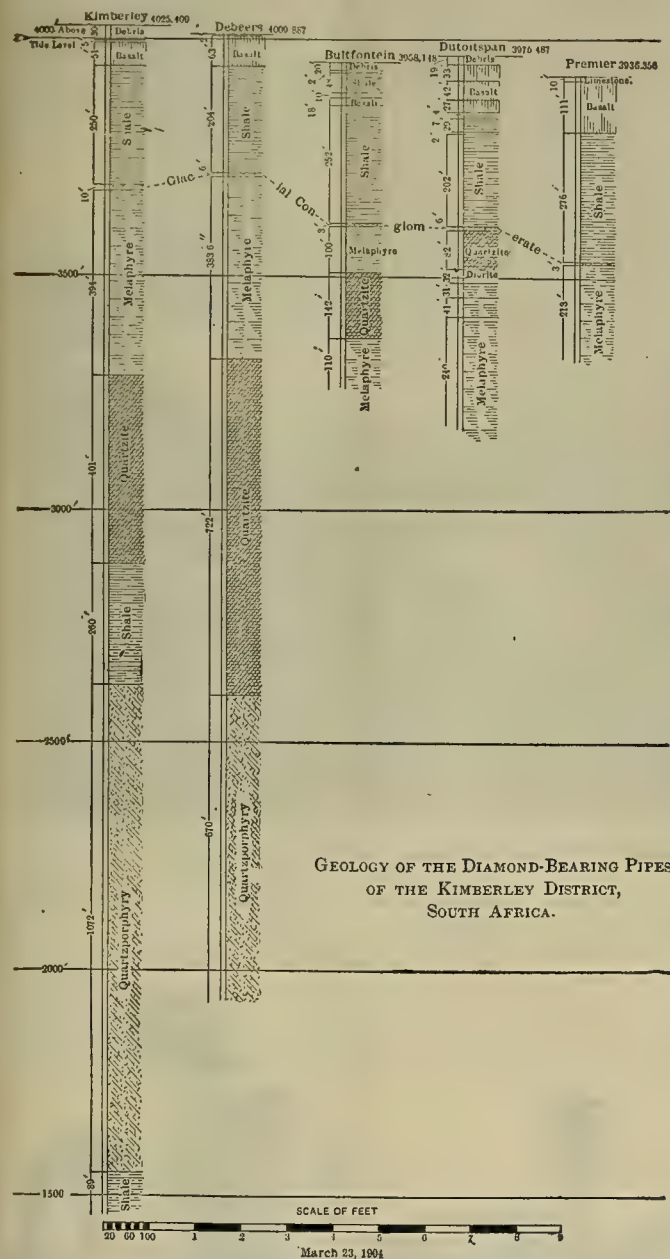

In these early days the cost of mining and milling was stated to be \$8 per ton. The Heslep vein adjoins the App and is parallel to it, the values being found in the amphibolite schists of the hanging wall country. The mines have been extensively developed and are well equipped with hoisting and milling machinery. There are a number of claims on Quartz mountain, and these are owned either by the App Co. at the north end of the hill, or by the Santa Ysabel at the south end. The latter company owns several full-sized claims and also a number of fractional claims. They also have four shafts—one of them being sunk in a tunnel. The first three shafts were known as the Knox & Boyle, Miller & Holmes and Santa Ysabel, respectively. Recently work was begun on a fourth vertical shaft, which is located east of the lode and is being sunk through the amphibolite schists of the hanging wall. Two of the engravings on the front page illustrate the Santa Ysabel hoist and mill and one of them the App property as viewed from the northwest side of the hill.

The new main shaft is down over 700 feet and sinking. The mine is equipped with steam hoist, oil being used as fuel. The hoist and the pumps at the 400 station are run by compressed air, generated by electricity. The mill has forty stamps. The power is so arranged that steam may be substituted for electric power at short notice in the event of anything occurring to prevent the latter from being used. At one time this company operated its own electric plant, but this has been discontinued.

In the Santa Ysabel mines both the ankerite and the amphibolite schist are developed and good values are found in both portions of the lode.

GEOLOGY OF THE DIAMOND-BEARING PIPES OF THE KIMBERLEY DISTRICT, SOUTH AFRICA.

almost pure carbon. These experiments have been confirmed by Dumas, Stas, Friedel, Roscoe and other eminent chemists, who have fixed with extreme precision the composition of the diamond to be pure carbon in crystalline form. The late Dr. W. Guybon Atherstone was one of the first scientists to deal with the occurrence and genesis of the diamond in the Kimberley mines. Being a resident of the Cape Colony, he made frequent visits to the diamond fields and made personal investigations.

"For a substance to crystallize," he says, "its molecules must be free to move. \* \* \* The diamond, we know, is neither soluble nor fusible. It is the element carbon crystallized, and is consumed by heat. How, then, could it survive as a crystal in the center of a volcano? The key to solve this mystery was placed in my hands over half a century ago by one of the greatest philosophers of the age, whose lectures I had the privilege of attending. \* \* \* 'Hold out your hand,' said Faraday, at the close of the lecture that fairly electrified the world of science, as with a loud hiss a snowy substance, burning

## Cyaniding in Kern County, California.

Written for the MINING AND SCIENTIFIC PRESS by W. L. COBB.

The old Piute mine lies 30 miles east of Bakersfield, Kern Co., Cal., at an elevation of about 7000 feet. The ore from this mine as originally extracted was sorted into first-class and second-class lots. The former nearly clean quartz, averaging about \$90 per ton, was arrastraed; the latter, consisting of quartz, gangue and some granite, was allowed to accumulate until the present company installed a Hendy 3-stamp quadruple discharge mill. Subsequently all quartz was brought to the surface and milled without sorting. About 85% of the value was saved by amalgamation and the resulting tailings cyanided as described below.

The cyanide plant was designed to treat ten tons of tailings per day, and consists of three vats 11 feet in diameter by 4 feet deep; two solution tanks, each of seven tons solution capacity; one sump holding twelve tons; one small gold-solution tank, built on the premises of 2-inch redwood; one plunger pump for pumping up solution; ten individual sheet-iron zinc boxes, arranged in two tiers of six each, with capacity of 1 cubic foot zinc each and with necessary valves, piping, etc. Steam for pump was furnished from mill boiler.

Notwithstanding the fact that it costs \$46 per ton to get freight from San Francisco, the entire cost of plant was under \$1000 and cost of tailings treatment

## A World's Fair Exhibit.

One of the many interesting exhibits at the World's Fair is that of the F. W. Braun Co. of Los Angeles, Cal., in Block 81, Mines and Metallurgy Building. This firm has on display over forty different styles of assay furnaces, to be operated with either gasoline, gas or crude oil. The Cary hydrocarbon burner burns gasoline of a specific gravity of 74° Baume, producing a very hot flame. The Marvel crude oil burner burns any grade of oil.

Their Chipmunk crusher, automatic sampler and disc pulverizer are also shown.

The vibratory jaw of the Chipmunk crusher is mounted upon an eccentric at its upper end, which imparts a gyratory movement, and rests against a toggle near its lower end, which compels the lower end to describe an arc of a small circle. This motion is both forward and downward and impels a discharge. This machine has a capacity of 300 pounds of granite of  $\frac{1}{4}$  inch and smaller per hour. The front jaw is removable for cleaning.

In the Umpire ore sampler the buckets revolve in opposite directions, and each bucket is divided into four parts—two closed and two open. The sample is halved in the upper bucket and again in the lower, allowing one-quarter of the original to fall into the receptacle.

A cam on the crank shaft agitates the hopper by striking a strap which is attached to the hopper with

## THE PROSPECTOR.

The sub-metallic mineral scales on the copper ore from Baker City, Or., are torbernite (copper uranite), hydrous phosphate of uranium and copper.

The rocks from Hailey, Idaho, have been determined as follows: No. 1. A basic dike rock, probably diabase. No. 2. Orthoclase porphyry. No. 3. Trachyte (typical). No. 4. Feldspar porphyry, much altered. No. 5. Quartz porphyry.

The rock specimens from Boise, Idaho, contain molybdenite. It is said that this mineral concentrates readily by the various modifications of the oil process. It may also be concentrated by crushing and running the pulp into a cone classifier, the coarse sands running out at the bottom and the slimes containing molybdenite at the top. The electro magnetic separator has also been used effectively in concentrating molybdenite from its ores. By wet concentration good results have been secured by crushing in jaw breakers and then in rolls, employing sizing screens and running the pulp over concentrating tables. Molybdenite is worth from \$200 to \$300 per ton when pure. To be marketable it must contain not less than 45% molybdenum and be free from copper. The Bethlehem, Penn., Steel Co. would be

Cyanide Plant of the Piute Mine, Kern County, Cal.

Exhibit of F. W. Braun & Co. at the World's Fair, St. Louis.

\$1.69 per ton. Later it was found necessary to treat the clay slimes from the stamp mill by agitation. For this purpose an agitator was constructed by placing the parts of an old arrastra in a 5x10 foot tank. A 3-inch outlet for discharging residues was placed 8 inches from the bottom of tank, which, on being discharged, left a bed of sands in the bottom, forming an excellent protection to tank bottom and revolving arms in event of rocks or hard lumps of clay being thrown in with tailings. A speed of from eight to ten revolutions per minute gave best results and agitation of pulp and solution was kept up for five hours, then allowed to settle for five hours, after which the solution was syphoned off into one of the percolation vats, where it acted as a weak solution and discharged into gold solution tanks further enriched and perfectly clear.

One advantage of this method was that the solution could be decanted much closer than when run directly into zinc boxes. After first solution was drawn off, an equal amount of water was added and the agitator again run for about one-half hour, the contents allowed to settle, again decanted and residue discharged. In this instance no trouble was experienced in starting up the horizontal arms of the arrastra after pulp had settled. The power for agitation also was furnished from mill boiler and engine, and, mechanically, the cost of agitation above percolation was not over 50 cents per ton.

The assay value of arrastra tailings was \$12 per ton; and though about 80% passed through an 80-mesh screen, they were perfectly amenable to treatment by percolation, giving 90% recovery with a four-day treatment. A 0.20% solution KCy was used in vats and 0.15% in agitator. From the latter we obtained an extraction of 70%.

All solutions, including washes, were piped to one gold solution tank and run through one set of zinc boxes. Precipitation was nearly perfect, the pregnant solution averaging about \$9 per ton, the spent 8 cents. Five pounds of lime per ton of tailings was used.

a coil spring, and, by means of an eccentric lever, the blows may be varied at will. The upper and lower buckets may be quickly removed and all portions are readily accessible.

a good place to send samples to ascertain the value of the material.

The mineral specimens from Deadwood, Idaho, are

Chipmunk Crusher.

Braun's Disc Pulverizer.

Umpire Power Sampler.

The disc pulverizer with one feeding will pulverize an entire ore sample to any desired fineness up to 200-mesh powder. An 8-ounce sample of ordinary granite rock can be reduced to 100-mesh in one minute.

It may be thoroughly cleaned after each sample and the adjustment altered in a second; it is dust proof; discs wear to place and are renewable. The discs are made of hardened steel with faces ground true. Oil can not enter the pulverizing chamber; it is arranged with tight and loose pulleys.

It is now proposed by an English company to systematically investigate the reported gold deposits on the island of Terra del Fuego, South America.

quartz containing crystals of pyrite, which in the outer portions have been altered to limonite (iron oxide). This is due to a process of slow oxidation during a long period of years, and not due to heat of volcanic rocks. This rock, if gold bearing, should prospect in the pan and should concentrate readily on machines in a mill after pulverizing under stamps. The metallic mineral in grains, coarse and fine, is plain iron sulphide. On roasting they will become dark red or brownish, and when pulverized should show gold in the pan. Of course, there is always the possibility that the gold will be too fine to be seen, in which case the rock must be assayed.

The rock specimen from Ouray, Colo., is liparite, a

variety of rhyolite. This kind of rock, like many other varieties of intrusive and eruptive rock, is not recognized as an ore unless containing valuable mineral. In the Calico district, San Bernardino county, Cal., rock similar in appearance to this Ouray rock, in a few instances, carried sufficient silver chloride to constitute a payable ore, and the best way to determine whether this rock contains values or not is to have it assayed for gold and silver.

### The Go-Devil Controller: A Gravity Tram Block.

A labor saving device recently perfected by A. D. Foote of the North Star Mines of Grass Valley, Cal., is shown by the accompanying illustration to consist

The Go-Devil Controller.

essentially of a mechanism for controlling the speed of the ascending and descending cars of a gravity tram. The wire rope is firmly held, yet easily moved, without undue wear from friction; it passes around three wheels rigidly held in the same plane by a three-armed casting. A block brake, actuated by a long lever, acts directly on the rims of these wheels, checking or stopping the motion of the rope as desired. The whole is attached to a horizontal bar in a wooden stull, and is held in position vertically by a chain. This forms a simple, but powerful means for controlling the speed of gravity tram cars, and may well be applied wherever such are in use.

It was originally designed for the control of the cars used in mining the stopes of the flat veins of the North Star mines. The pitch is enough to allow cars to descend, but without their use repeated shoveling of the ore was necessary to bring it to the chutes at the main tunnels, because the natural slope was not great enough to move the rock.

This block is manufactured and sold by the Roebeling's Sons Wire Rope Co., 117 Liberty street, New York City; 25 Fremont street, San Francisco, Cal.; 171 Lake street, Chicago, Ill.

### The McCully Gyrotory Crusher.

The accompanying cut shows a sectional view of the McCully gyrotory crusher, an important feature of which, say its manufacturers, is that its main shaft and crushing head are suspended from the

Sectional View of McCully Crusher.

spider at the pivot point or point of no gyration. The point of greatest movement is at the lower end of the main shaft. This arrangement permits of a minimum of power being used for the work accomplished and is also claimed to reduce the liability of shaft's breaking. The running parts of the machine are readily accessible and can be examined and oiled while operating without danger to the attendant. The main shaft may be adjusted without altering its "set angle" and its true line of bearing. The manufacturers also furnish the McCully crusher in all sizes with "right angle drive," when necessary—that is, the band wheel may be set on the right or left hand side of the crusher when looking into the discharge spout. By this arrangement the belting and power distribution of the plant may be simplified. Size No. 1 weighs 5800 pounds, with a rated capacity of

five to nine tons per hour; size No. 9 weighs 145,000 pounds, capacity 150 to 250 tons per hour (according to size and character of rock handled). These machines are manufactured by the Power & Mining Machinery Co. of Cudahy, Wis., represented on the Pacific coast by Charles C. Moore & Co., 63 First street, San Francisco, Cal.

### Geology of the Treadwell Ore Deposits, Douglas Island, Alaska.\*

NUMBER II.

Written by ARTHUR C. SPENCER.

**CRYSTALLINE SCHISTS.**—Next to the main intrusive mass of the Coast range, but intricately dove-tailed by its offshoots and outlying arms, there is a series of crystalline schists derived by metamorphism from sedimentary rocks. These are mainly mica, hornblende and garnet-schists, such as would naturally result from the alteration of calcareous and feldspathic sandstones and shales. With them, however, there are some well-defined strata of limestone and quartzite in which the effects of metamorphism are ordinarily less apparent to the eye, though the former are often thoroughly crystalline. The schistosity which characterizes this series follows the surfaces of stratification, as may be seen in many places from the attitude of the secondary structure in reference to the persistent strata of varying composition, such as limestone and quartzite.

Locally, igneous material has been intruded into the schists in the form of small aplite stringers, either crosscutting the schists or following their platy structure, forming in some instances a rock of gneissic appearance, not readily distinguishable from gneissic phases of the intrusive diorite. Rocks of this sort, which may be called injection gneisses, are confined to the vicinity of the diorite masses. In the main the schists are regarded, however, as having been formed by the crystallization of the originally sedimentary strata without important addition of outside material.

The crystalline schists form the country rock for many large masses of diorite, and also enclose dikes of a dark colored igneous rock, which though greatly altered seems originally to have been gabbro. The intrusions usually follow the structure of the rocks rather closely. In places the invading dikes have been mashed and recrystallized, and the gabbros sometimes give rise to hornblende schists which are not distinguishable from others of sedimentary origin, except in cases where gradation from the original into the secondary rocks can be observed. Some of the

aplite-dikes which cut the schists are mineralized, and many independent stringers, gash-veins and lenses of quartz occur, and are often gold-bearing, but so far as observed the prospect of finding productive deposits in the schist band is not particularly encouraging.

The width of the zone of crystalline schists varies from about 3 miles in the transverse section through the Douglas island mines to zero in the vicinity of Berners bay to the north, where it is cut out by the gradual edging over of the Coast range diorite. Toward the southwest, for a distance of several miles, its width is somewhat greater than 3 miles, but it becomes narrower again farther down the coast toward Windham bay. The variation in width of the schist band indicates the amount of crosscutting by the diorite. Excluding the bodies of intrusive rock which it contains, this series has an apparent thickness of about 15,000 feet, no trustworthy evidence of duplication of beds having been detected, though carefully sought.

**BLACK SLATES AND GREENSTONES.**—The outermost of the three principal lithological groups of the region is composed of alternating beds of greenstone and black slate, with occasional lenticular masses of limestone. Up and down the coast as far as observation has extended these rocks occupy all the mainland strip between the band of crystalline schists and the shores of Stephens passage and Lynn canal. They occur also on the adjacent islands of the Alexander archipelago, and though the western limit of the band has not been determined, similar rocks cover all the inland side of Admiralty island which, lying opposite Juneau and Douglas island, parallels the mainland for a distance of 70 miles. The whole band is thus not less than 15 miles wide, but the extreme width of the mainland portion is about 8 miles. From the boundary with the schist on the northeast to the far side of Douglas island the distance is about 7 miles.

In the vicinity of Juneau, four sub-zones, based upon the distribution of the greenstone, may be distinguished. On the inland side there is a band of black slate free from greenstones, a mile or so in width. Next to the slates and dipping beneath them comes a band 1.5 miles wide, composed mostly of greenstone schist, derived from the metamorphism of ancient surface lavas, though with these there are several thin intercalated beds of black limy slate. The third sub-zone, beginning somewhere beneath the waters of Gastineau channel, extends to the base of the mountains back of the relatively low platform on the inland side of Douglas island, and its width is therefore about 1.5 miles. The landward two-thirds is composed of alternating beds of greenstone and slate, with the latter in excess, as may be observed along the upper end of the channel where the strata strike out into Douglas island; while the outer third is composed entirely of black limy slates. These last mentioned black slates form the country rock for a system of syenite dikes, certain of which constitute the Treadwell ore bodies. The rocks of the fourth sub-zone form the mountains on Douglas island. They are basaltic greenstones and greenstone breccias, evidently representing a great series of volcanic flows and agglomerates.

All the different parts of the slate greenstone series lie in parallel position, striking northwest and southeast, and dipping toward the northeast in conformity to the prevailing structure of the region. The rocks are considerably, but not uniformly, metamorphosed. The slates, which now contain large amounts of graphite, were originally carbonaceous shales; the limestone strata are often only partially recrystallized and sometimes give a strong odor of kerosene; the greenstones are locally crushed and changed to chloritic schists. Slaty cleavage and schistosity are normally parallel with the bedding of the rocks, though locally where plication exists there may be wide divergence of primary and secondary structures.

The age of the slates is known to be Paleozoic from the presence of probably Carboniferous fossils in associated limestones at Taku harbor, about 20 miles southeast of Juneau. They therefore correspond in a general way with the Calaveras formation of California, which they closely resemble in lithology, metamorphism and structure. The Calaveras formation likewise forms the country for gold quartz veins later than dioritic intrusions resembling those of southeastern Alaska.

The greenstones are mostly volcanic rocks which flowed out upon the surface at different times during the deposition of the sedimentary strata with which they occur. In their present condition they are similar to the rocks called amphibolites in the U. S. Geological Survey reports on the Mother Lode in California, which have also been considered to be volcanic rocks crystallized under surface conditions.

In the Juneau region the way in which the thick masses of these rocks are built up in layers, sometimes interleaved with thin sedimentary strata, the occurrence of vesicular beds, and of breccias made up of volcanic bombs and fragmental igneous material, all indicate their origin as surface volcanics. There are, however, some green rocks of very similar appearance, which seem to be intrusive, and the two sorts are usually indistinguishable, unless, as rarely happens, the fact of invasion and later origin can be

\* Abstract Am. Inst. Min. Engs

established by evident crosscutting of the stratification.

In the band of slates and greenstones there are occasional masses of diorite related to the main intrusive rock of the neighboring Coast range. In general these are distributed irregularly in all parts of the series, though in the immediate vicinity of Douglas island the only large masses are on the northern end of Glass peninsula, which forms the landward side of Admiralty island opposite the lower end of Douglas island, and on Grand island in Stephens passage near by. A small intrusion occurs back of Sheep creek on the mainland about 2 miles from Gastineau channel, but the only other occurrences known are in the series of dikes which form an important feature in the local geology of the part of Douglas island where the Treadwell mines are situated.

Other intrusive rocks are narrow dikes of basalt or minette usually crosscutting the country, and a series of basic dikes and irregular masses noted mainly in the upper or inland black slate sub-zone of this band, though they are also found in the crystalline schists, as already stated, and they have been recognized in the band of greenstones on the northeast side of Gastineau channel. These dikes which follow the structure of the slates closely, but not absolutely, are usually highly metamorphosed, but they seem originally to have had the composition of gabbro.

**ORE DEPOSITS OF THE REGION.**—The accessible portion of the mainland from Windham bay northwestward to Berners bay, including also Douglas island, is here designated as the Juneau gold belt.

Of the three bands or groups of rocks which occur in this belt, the slate-greenstone band is pre-eminent in the number of quartz veins and other forms of metallic mineralization which it contains. All the proved placer deposits and all the mines and noteworthy prospects of the district are situated in the strip covered by these rocks. The comparative accessibility of the slate-greenstone band may account for the distribution of the active operations in part, but farther inland prospecting in the crystalline schists and in the diorite intrusives has never given equal promise of valuable deposits.

The most prominent economic feature of the slate-greenstone band is a strong lode system or complex of veins, traceable throughout the length of the belt. South of Berners bay all the best placer ground, and all the lode mines which have produced important amounts of bullion, excepting the Treadwell group and its former placers, are on this main system of veins. It compares in a general way with the Mother Lode of California, but follows more closely the structure of the rocks. Its position is in the upper black slate sub-zone of the slate-greenstone

Fig. 4—Geological Section Douglas Island and Mainland Near Juneau, Alaska.

band, just above its contact with the uppermost greenstone beds of the next lower sub-zone (Fig. 4). The characteristics of the lodes may be studied in the Gold creek and Sheep creek mines, which have been producing for many years, but are only now being developed upon the large scale which the extent and importance of the deposits demand.

In the vicinity of Juneau the second sub-zone, composed mainly of greenstone schists, shows considerable mineralization in the aggregate, and there is at least one vein which may be traced for several miles with practical continuity, but to the north and south give more promise.

Observations on the occurrence and distribution of mineralization in the third sub-zone, composed principally of black slates, with some interbedded greenstones, have been confined to Douglas island, where mineralized dikes of albite-diorite intrusive in the black slate form the Treadwell deposits. Outside of these properties there are some stringer leads of quartz and a certain amount of general impregnation in basic greenstones which are probably ancient lava flows, but neither of these types of mineralization is likely to yield workable deposits within this band of rocks.

The greenstones which form the mass of the fourth sub-zone are in part highly mineralized. Southeast of the Treadwell mines in Nevada creek, which is the southernmost of the longer streams on the mainland side of Douglas island, these rocks have been altered to propylite by solutions which have permeated them, and a large mass of the rock has been impregnated with disseminated pyrite carrying small amounts of gold. This mineralized material extends for nearly 1.5 miles parallel with the strike of the rocks and not less than 1 mile across their trend. With the pyrite, lead, zinc and copper sulphides sometimes occur, and when these are present assays show silver and an increased proportion of gold. The richer material is, however, largely concentrated in narrow zones marked by ill-defined fissures, which are ordinarily transverse to the general northwest

trend of the mineralized mass. Only a small amount of quartz is present in the form of vein filling. This area of mineralization has not been thoroughly prospected, and workable ore bodies may eventually be found in it.

Another similar mass of pyrite-impregnated rock occurs in the same band of greenstones opposite the Treadwell mines. Here the altered and mineralized material outcrops in a zone perhaps not over 300 feet wide, and is traceable for at least 1 mile from southeast to northwest. Such prospecting as has been done has not given particularly encouraging results.

In all the outer portion of Douglas island the amount of quartz in veins is small in comparison with that occurring in other parts of the slate-greenstone band, and while other instances of pyrite deposition than those mentioned are known, from present developments none of them seem to be of much promise.

## Crushing in Cyanide Solution as Carried on in the Black Hills, S. D.\*

NUMBER IV.

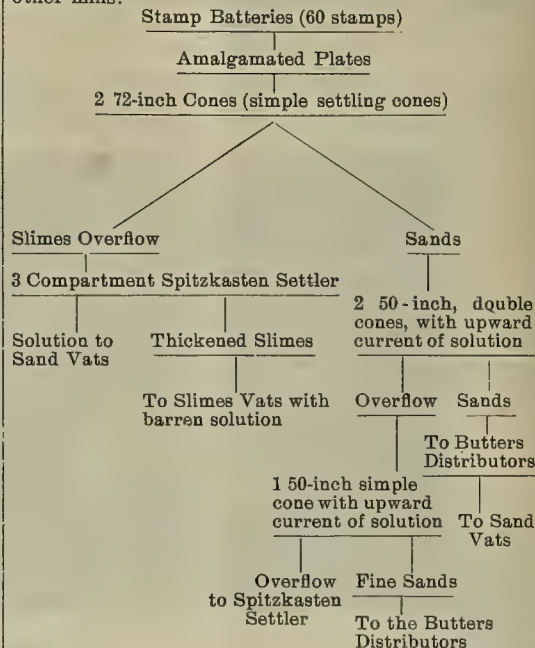

Written by C. H. FULTON.

A very close and satisfactory separation, however, is not possible, first, on account of the inherent defects of the cones used as classifiers, and second, because of the bad effect of the lime in sending slimes with the sands as already mentioned. For these reasons the classification adopted is that of making a clean sand rather than a clean slime, this being the lesser of two evils. For example, at the Maitland mill the sands carry only 1% or 2% of slimes, 5% giving an unsatisfactory leaching rate. In making sands of this kind the slimes run from 15% to 20% of fine sands, but a small portion of which remains on a 150-mesh screen. The proportion of the ore crushed treated as sands and slimes varies at the different mills. At the Maitland mill the average figures for eight months show 48.2% of the ore treated as sands and 51.8% treated as slimes. At the Dakota mill the sands amount to 65% to 70% and the slimes to 30% to 35%. At the Lundborg, Dorr & Wilson mill the sands and slimes amount to approximately 50% in each case. At the Horseshoe mill the slimes amount to 26% to 30% and the sands to 70% to 74%.

A number of different systems of classification by the cones was tried before the system described was adopted. It will be noticed that the system now used reclassifies the sands from the upper cones. Formerly the plan was to reclassify the slimes overflow from the upper cones in the lower cones, but this practice was soon discarded as unsatisfactory, giving in some instances unleachable sands. Double cones were also used, i. e., the regulation cone classifier, but most of the mills now classify with the inner cone removed. The only mill where a double cone with an upward current is used to reclassify the sands is at the Hidden Fortune mill.

Two of the mills, the Lundborg, Dorr & Wilson and the Hidden Fortune, unwater the slimes before they go to the slimes tanks. The first by means of a large sheet iron cone 22 feet in diameter, the top portion sloping 40° and

tanks. The object of unwatering the slimes in this way is to give them an additional treatment with barren solution, for when not unwatering the slimes they go to the slimes vat with battery solution and are settled there for the first time, while with the unwatering device the slimes go to the slimes tanks with barren solution having had one dilution by the time they reach the first slimes tank. The scheme of classification at the Hidden Fortune mill is given below, as it is somewhat different from that of the other mills:

To show the nature of the classification at some of the mills the following mechanical analyses of sands and slimes are appended:

### MECHANICAL ANALYSES OF SANDS AND SLIMES.

Sands at the Dakota mill constituting 70% of the mill product.	Slimes at the Dakota mill constituting 30% of the mill product.
On a 20-mesh screen 13% to 20%.	On a 100-mesh screen 0.3% to 0.4%.
On a 40-mesh screen 30%.	On a 150-mesh screen 12% to 33%.
On a 80-mesh screen 26% to 54%.	Passed a 150-mesh 60% to 87%.
On a 100-mesh screen 7% to 8%.	
On a 150-mesh screen 13% to 18%.	
Passed a 150-mesh 4% to 5%.	
Sands at the Lundborg, Dorr & Wilson mill, constituting 50% of the mill product.	Slimes at the same mill, constituting 50% of the mill product.
On a 40-mesh screen 30%.	On a 60-mesh screen 9.5%.
On a 100-mesh screen 40%.	On a 100-mesh screen 1.5%.
On a 200-mesh screen 24%.	On a 200-mesh screen 18%.
Passed a 200-mesh 6%.	Passed a 200-mesh screen 80%.

It may be noted that a comparison of these products at the different mills is not possible, as the ores differ, and what is a fine sand at one mill according to mesh size may be a slime at another.

The proper separation of the sands from the slimes is a vital question to be solved with the plants of the Black Hills, and is one that has given the mill men much trouble. While the present system is a great improvement on the practice of the earlier mills, there is still much room for further improvement.

Distributor for Sands

the lower portion near the discharge 60°, and the second by means of a three-compartment spitzkasten 40 feet long, 6 feet wide and 8 feet deep. The compartments are charged successively and the thickened slimes drawn off and mixed with solution in the launder that transfers them to the slimes

**THE TREATMENT OF THE SANDS.**—The filling of the sand tanks is accomplished by distributors of the Butters and Mein type, the construction of which is shown in detail in the accompanying drawing. The distributor is suspended from a trolley running on tracks above the sand vats, so that the distributor can readily be transferred from one vat to the other. The sands are fed into the hopper of the distributor

\* Bulletin No. 7, South Dakota School of Mines.

by a launder, which feeds as near the center of the hopper as possible, avoiding the throwing of the feed against the sides, as this causes an irregular distribution of the sands in the vat. The dimensions of the distributors vary according to the capacity required. The slope of the pipe arms is 1 in 12, and the diameter of the pipes varies in the different distributors from 1.5 to 2.5 inches. Generally all the pipe arms in a distributor are of the same diameter, but in the one at the Horseshoe mill the long arms are 3.5 inches, the medium arms are 2.5 to 3 inches and the short arms 2 inches in diameter. The discharge nozzles are usually separate castings, the discharge being controlled by wooden plugs. The number of arms is generally six, although the distributor at the Horseshoe mill has eight arms. In the case of one of the six-arm distributors the following figures give the length of arms—13.25 feet, 11.5 feet, 9.5 feet, 8.0 feet, 5.5 feet and 2.5 feet. These arms are unsymmetrically hung in such a way that their weight balances the distributor. The discharge of the pipe arms must cover the surface of the vat. The hoppers of the distributors are provided with a horizontal screen to keep foreign matter out of the pipe arms. The function of the distributors in the mills crushing siliceous ore is not in part that of a classifier acting with a filled vat in removing slimes from sands, but it acts solely to evenly distribute sand in the vats. The sands are not laid down under water or solution, but the vat is what might be called dry filled, the solution which goes into the vat continually draining off through the filter until the vat is full of sands. The top layer of sands in the vat is always practically dry. This method of filling has the advantage, first, that the slimes in the pulp are uniformly distributed with the sands in the vats, which is not the case when direct filling is employed under water; second, that for this reason it gives a charge that is more percolable, and third, that during the filling a great amount of solution passes through the sands, in this way treatment going on all the time that the vat is filling. The charge laid down in this way is also more porous than when laid down under water. At the Maitland mill the amount of solution passing through a 150-ton charge of sands while filling is 700 tons, or 4.7 tons of solution per ton of sands.

The time of filling a 30 by 6-foot vat at the Maitland mill is 60 hours; at the Lundborg, Dorr & Wilson mill a vat, 18 by 10 feet, is filled in 60 to 72 hours. At the Dakota mill a 115-ton vat is filled in 38 hours.

## Mining and Metallurgical Patents.

PATENTS ISSUED OCTOBER 4, 1904.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

COMBINED CHUCK AND ROTATING DEVICE FOR ROCK DRILLS.—No. 771,218; G. H. Gilman, Franklin, Pa.

In combined chuck and rotating device for rock drills, piston operably seated in cylinder, hammer of piston, hammer having one or more straight grooves and one or more spiral grooves upon its periphery, cylinder aforesaid, guide plate rigidly mounted in cylinder, there being hole in plate through which hammer is adapted to reciprocate, keys in plate adapted to seat in straight grooves aforesaid, rotating plate rotatably mounted in cylinder, there being hole in plate through which hammer is adapted to reciprocate, spiral flukes in plate adapted to seat in spiral grooves of hammer, whereby plate is adapted to be rotated, in combination with chuck adapted to be rotated by rotating plate.

COOLING DEVICE FOR BLAST FURNACES.—No. 770,910; L. Keyling, Berlin, Germany.

Cooling device for blast furnaces, combination of box in which upper opening of furnace is situated, plate situated in box vertically above upper opening of furnace, diameter of plate being larger than upper opening of furnace, so that edge of plate projects sideways over opening of furnace, water nozzle situated vertically above plate, annular channel around top part of furnace in box and means for connecting channel with outside.

GUIDE SHEAVE FOR HOISTING APPARATUS.—No. 770,857; J. W. Hollenbeck and W. E. Palmer, San Francisco, Cal.

Combination with hoisting apparatus, of rope, means for driving rope, sheave over which rope passes intermediate of its ends, boxes carrying support which is turnable parallel with and above normal line of travel of rope, convergent arms fixed to support and pin upon which sheave is turnable.

PROCESS OF CONCENTRATING ORES.—No. 771,277; A. H. Schwarz, New York, N. Y.

Method of concentrating ores by mixing melted fatty matter which is solid at normal temperatures with ore, solidifying fatty matter, then separating gangue from values entrained in fatty matter while latter is solidified, and finally liquefying fatty matter to separate values therefrom.

DRILL SHARPENER.—No. 771,737; F. Markwick, Scranton, Pa.

Drill-forming die comprising plurality of forming bars, spacing pieces interposed between bars, sleeve inclosing bars and pieces, sleeve being formed with

transverse slot, collar surrounding sleeve in plane of slot, and wedge arranged within slot between collar and bars.

ELECTRICAL HOISTING APPARATUS.—No. 771,351; E. B. Clark, Chicago, Ill.

Hoisting mechanism comprising following elements: Hoisting motor, controlling mechanism therefor, automatic mechanism for operating controlling mechanism, manual mechanism for operating controlling mechanism, and means for bringing into use either manual or automatic operating mechanism.

APPARATUS FOR EXTRACTING GOLD FROM AURIFEROUS SAND, ETC.—No. 771,454; R. Blake, Madison, N. J.

In machine combination with tank adapted to contain lower body of mercury and having discharge located in relatively elevated plane, of horizontal cylinder transversely within tank and adapted to have lower portion immersed in mercury, provision for supplying material to tank, in front of cylinder, pivotally suspended arm depending within upper portion of tank at rear of horizontal cylinder and between latter and discharge, arm provided with series of teeth extending transversely across tank, length of arm and teeth conjointly being such that teeth in lowest position will be above mercury, and means for actuating cylinder for immersing material in mercury and causing material to pass beneath cylinder, and for oscillating arm for causing teeth to move back and forth in path of arc solely above plane of mercury surface.

HYDRAULIC FLUME FOR MINING FINE MATERIAL.—No. 771,792; G. W. Wilderman, Portland, Or.

Hydraulic fluming apparatus, comprising hopper or receiver, means for screening and distributing material discharged from same, flume or trough, feeder in trough under hopper, feeder comprising series of curved, parallel plates adapted to mechanically divide pulp and solution discharging from hopper into plurality of thin streams, tier of removable amalgamating plates adapted to provide plurality of parallel channels, so as to allow each of streams of pulp and solution issuing from feeder to pass between two plates of tier; plates being respectively plated with amalgamating film on both their top and bottom surfaces, and supported, one above the other, at such distance apart as to cause top and bottom surfaces of each stream of pulp and solution to be in continuous contact with surfaces of two plates between which it passes; and means for holding amalgamating plates in place.

# Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE  
MINING AND SCIENTIFIC PRESS.

## ALASKA.

The Alaska season for 1904 is closed, as far as shipments to the north are concerned, and boats are leaving for the last trip of the season to Nome, St. Michael, Dutch Harbor, Cook Inlet and other places along the southeastern coast. The gold production of the northern district for the present year is estimated as follows: Klondike, \$11,000,000; Nome, \$10,000,000; Tanana, \$2,000,000; all the other districts, \$3,000,000.

## ARIZONA.

### Cochise County.

At Tombstone the Tombstone Con. mines, being opened under direction of Manager Staunton, reports progress, though they are getting more water than had been expected. They are pumping about 3,000,000 gallons of water per day from the mine and continue sinking. Deepest workings are 810 feet, which is over 250 feet below the water level existing when the pumps were first started. The draining of the basin is proving slow work. The ground is being opened 100 feet below the former water level in three shafts, the Emerald, the Silver Thread and the West Side.

### Gila County.

The Globe M. Co. is exploring the old workings of the Miami mine, near Globe, and at a depth of 135 feet has opened a stope in which is exposed a 20-foot vein of silver and gray copper ore. The shaft has been cleaned out to 235 feet. Ore is being broken.

Machinery for the Pinto Creek M. & S. Co., consisting of an air compressor, drills, etc., are at the mine at Pinto creek, 20 miles west of Globe. Driving the lower tunnel on the Yo Tambien mine will be resumed, says Superintendent Fuller.

### Mohave County.

Superintendent W. A. Fellows is putting in a 20 H. P. hoist on the Tom Reed mine, of the Hilty Anderson group, near Acme, and expects to have it in operation next week. Buildings are being erected. The mines are in Gold Roads section.

T. Ewing of San Francisco, Cal., has bonded the Victor and Virgin mining claims, near Vivian, and will put in a hoisting plant and sink the main shaft to several hundred feet.

H. C. Dayton, superintendent of the Sun Cloud mine, near Signal, says he will resume work on the Sun Cloud and increase development.

About forty men are at work on the Banner group of mines at Stockton Hill, says P. Wiseman, superintendent. Ore is being hauled to Berry from the mines to be shipped to the smelter at Needles, Cal.

### Pinal County.

J. Champion has started work on the Belle, Columbia and Martinez mines in Mineral Hill district and will build a wagon road from the mines to the Phoenix & Eastern Railroad at Price station, 10 miles east of Florence. The mines were formerly the Pinal Con. group, in connection with which the Butte smelter was built. The ores are high-grade lead-silver.

### Santa Cruz County.

The Arizona-Mexico Investment Co. has a working bond on the Golden Rose group of mines, on the west slope of the Patagonia mountains, 12 miles northeast of Nogales. The group includes five claims, one of which has a shaft 135 feet deep, a tunnel and drifts, besides several prospecting shafts, says the Oasis. There are several ledges running through the properties and three of them unite at a point within the ground involved, where the company will start development. These ledges are 3 to 6 feet in width and carry lead, silver and gold.

J. N. Curtis, manager of the Mowry silver mines at Patagonia, reports satisfactory developments. A set of pumps, with capacity of 600,000 gallons per day, are in operation. Men are at work on the 400-foot crosscut. The present pipe gives a 4-inch discharge, but it is expected to put in a set of 8-inch pipes. Two more boilers will be set up, additional sinking pumps installed and sinking continued in the double-compartment shaft to the 500-foot level. The vein is said to be 70 feet thick, averaging \$10 a ton.

### Yavapai County.

D. J. Sullivan, at Congress, says he is running ore from the Alaska mine through the Congress G. Co. mill, \$38 per ton being recovered. He will deliver twenty tons daily of that class of ore. The Congress Co. has a milling power of eighty stamps and is using only forty stamps on its own ores.

### Yuma County.

H. L. McCarn, superintendent of the Planet mines near Planet, south of Kingman, says the mines are being worked by a few men and satisfactory results are being obtained. If the Congress & Colorado railroad is built the company expects to operate the mines on a larger scale and build reduction works on Bill Williams fork.

At Quartzsite the 10-stamp mill has started working on the Belle of Arizona mine, says Manager Darling, with satisfactory results.—At La Cholla, near Quartzsite, the Amalgamated G. M. Co. is putting up a 120-stamp mill and will increase the number of men at work.

## ARKANSAS.

### Marion County.

Yellville reports say J. J. Shaffer and J. T. Vower of Boulder, Colo., owning eighty acres of school land in Mud Springs hollow, have struck payable ore in Buffalo mining district. They drilled on this claim and cut into ore at the depth of 27 feet, showing 17 feet of jack, and they are sinking a shaft on the drill hole. The company will put in a 200-ton plant. The mine is 1½ mile west of Maumee, in the Maumee, Jack Pot, Mud Hollow and Rock Creek mining basin, and is 1 mile north of the Buffalo river.

### Searcy County.

A. J. Riley of Yellville says his Turkey Fat M. Co. has an 8-foot face of high-grade zinc blende showing in the drift, and they are down 20 feet in the winze, 160 feet from drift, and expect to find the same run of ore at 35 feet. He also says that 1 mile west of above, Colorado and Oklahoma men have struck a run of high-grade zinc ore in dolomite.

## CALIFORNIA.

### Amador County.

An oil tank has been built near the Keystone hoist at Amador City and facilities for burning oil are being put in. Oil will be used there entirely.

At the Kennedy mine at Jackson, at the east shaft, the new reels of the hoist are heavier by ten tons than the reels they displaced. Six furnaces keep the hoist supplied with steam, leaving three furnaces in reserve. Sinking has resumed. The shaft is 2640 feet vertical depth, including a sump of 50 feet. It is the intention to sink 300 feet deeper. The sinking will not interfere with mining operations. The mill will be kept running to full capacity. A small engine has been placed at the 1600-foot level to hoist the rock to that point. The 40-stamp addition to the milling capacity is making headway. The building is inclosed; the mortar blocks are completed and work of putting the machinery in place started. A dynamo room is provided at south end of the mill, corresponding to the one at the north end which supplies the power for the sixty stamps now in motion. The forty stamps addition will be operated as an independent mill. A machine and blacksmith shop has been built east of the shaft. The machine shop will include lathe, steam hammer, band saw, etc., in its equipment, says Superintendent Webb Smith.

### Calaveras County.

At the Sonoma mine, at Murphys, bonded by F. Healy of Santa Rosa, the vein is showing 6 feet in width and free gold can be seen, says Superintendent Cunliffe. The company operating the mine is The Sierra Nevada Dev. Co. The ore carries silver values with the gold.

W. H. Cleary is arranging to put up a 10-stamp mill at his mine on Indian creek, near Murphys. The mill will be run by electricity from the Utica power plant.

The Ford mill, near San Andreas, is being torn down and will be put up on the mine bought by R. B. Parks and W. R. Womble at Hodson.

The Gold Divide mine, on Tunnel ridge, near the Calaveras river, formerly known as the Shoe String, is being operated by F. O. Courtmarsh, M. Humphrey and E. Pellaton of Mokelumne Hill. It is a gravel proposition and sinking is in progress. When the channel is "bottomed," drifting and crosscutting will be done. Machinery will be put in to work the mine. The claim comprises eighty acres of land. Operations are under supervision of F. O. Courtmarsh.

### Contra Costa County.

The Pacific Coast Oil Co. has let the contract for grading for the site for an addition to its refinery at Point Richmond. Three steam shovels and a large number of men will be put to work. Several brick buildings will be put up, also car shops for repairing oil tank cars.

### Del Norte County.

The Waldo S. & M. Co., operating at Waldo, Or., through Manager T. W. Draper, has made final payment of \$25,000 on the Monumental mine, of Shelly Creek district, near the Oregon State line.

The Monumental was bonded one year ago and forty-five men are at work. A steam hoist and compressor are up and machine drills are at work in the tunnels and drifts. It is intended to put in a smelter and cyanide plant.

### El Dorado County.

At the Ida Mitchell mine, near Placerville, the electric plant has been completed and the power drills started, says the Mountain Democrat. The mine hoist and pump are operated by steam, and the drills by electrical power.—W. S. Bacon, in charge of the Barbara mine near Gold Hill, says a steam hoist is being set up.—At the Landecker gravel mine buildings are going up. The mill nearing completion will have capacity of treating 100 tons of gravel per day.—At the River Hill mine ore is being taken out at the 1000-foot level. Assays of the ore run \$30 per ton, says Manager T. Clark.

The Kelsey gold and silver mine extends from the South Fork of the American river above Chili Bar, about 2 miles, to Big Sandy near Kelsey. Six hundred feet of tunnel has developed prospects and the owners are starting operations. Pipe lines are to be built, and a 3-stamp mill, and fifteen men have been put to work.

### Humboldt County.

At Quimby creek, in New River district, near Blue Lakes, the quartz deposits of the Quimby G. M. Co. will be developed and machinery is being put in by W. R. Beall and J. A. Brent, principal owners. They will build a sawmill of 10,000 feet capacity per day, and put in three 3-stamp batteries, quadruple discharge, 1000-pound stamps. An aerial tramway, 1500 feet long, will also be installed. The plant is expected to be in running order by Jan. 1.

### Kern County.

(Special Correspondence).—In Mojave mines development is being carried on and four separate companies are working full handed. The mines are 4 miles from Mojave station, where the S. P. and Santa Fe separate after crossing Tehachapi Pass on the same tracks, the former running to Los Angeles, the latter continuing eastward—its main overland line. The four companies are the Exposed Treasure, operating on Bowers' hill; Karma M. Co., Queen Esther M. Co. and Echo M. Co., operating on Soledad mountain, from 1 to 2 miles farther west than the Exposed Treasure.

The Exposed Treasure has twenty-five stamps and amalgamates and cyanides, employing in the details some methods not in common use, the outgrowth of ideas and experiments of Manager DeKalb. He states that his ore is very different from that of his neighbors. He assigns it to a different geological age.

The Karma M. Co. employs twenty stamps and concentrates and cyanides, omitting amalgamation. The mill was started last April under superintendence of R. G. Eckis. Manager J. A. Gerner is also at the property. It consists of five claims, with a total of a mile of work. Thirty-five men are at work and sixty tons per day are treated at a total cost, it is stated, of about \$2 per ton. The management proposes adding thirty stamps. This mine, like all in the district, is entirely a tunnel proposition and the ore silver-gold.

Adjacent to the Karma mill is the mill of the Queen Esther Co., of which S. W. Mudd is manager. The ore is treated by utilizing one Blake, one Dodge crusher and three Llewellyn rolls. About sixty men are worked and 100 tons per day are treated. The group consists of ten claims. It is a large, low-grade silver-gold proposition. About 2000 feet of work have been done.

The Echo M. Co., G. H. Hooper principal owner, consists of fifteen claims. Its 20-stamp mill treats sixty tons per day, and preparations are being made to install ten additional stamps. Also an air compressor is being put in and four machine drills will be used in the mine. There are two veins running the length of the property—the Echo, 2 to 10 feet wide, and the Starlight, 4 to 16 feet wide, parallel and trending northeast to southwest. About 3000 feet of tunnels and raises have been completed. The mill has been in operation eighteen months. The treatment is similar to that employed in the Black Hills, S. D.—the ore is crushed in a weak cyanide solution, sand and slimes separated by a screw separator; the sand is then leached and the slimes are worked in agitators in which there is upward percolation of water; the solution overflows the top and passes to settling tanks; about half of this is again returned to the crusher and the remainder passes through the zinc boxes and is again utilized to leach the slimes. A close saving of values is claimed with a minimum use of water.

The water supply of the Karma, Queen Esther and Echo comes from Cameron, 2 miles, and the Exposed Treasure from Oak creek, 16 miles. These companies are all

close corporations. A large amount of money is being expended and little said about it.

Outside of the four active companies there is little being done and almost no prospecting. On Bowers' hill, opposite the Exposed Treasure, is a property of nine claims, owned by Tate, Parker, Goldsworthy & Ashton, with two shafts, 200 feet and 150 feet deep, respectively, and some drifting. The owners are negotiating its sale.

Mojave, Oct. 12.

### Nevada County.

G. W. Manwell, of Wheatland, reports for fifteen days run at the Black Swan blue gravel mine at Mooney Flat, 10 miles west of Grass Valley, the cleanup amounted to \$1500. Manwell says the mine is improving. They have twenty-three men at work and expect to double the number.

The New York-Grass Valley G. M. Co., says Manager G. W. Root, at Grass Valley, will build a sand plant or a slimes plant to handle the tailings from the mill. Another improvement authorized by the directors is a 100-light electric plant for lighting the underground workings.

### Placer County.

In the Hidden Treasure mine, at Bullion (formerly known as Centerville), 200 men are at work and are taking out a large quantity of gravel daily, says the Colfax Sentinel. A contract was let last week for running the tunnel 400 feet additional. The company is sinking an air shaft which will strike the tunnel in about 2 miles from the mouth, and it is estimated that the depth to sink will be 740 feet. They will start a raise to meet it. A 50 H. P. motor is being set up at the shaft. All the timbers will be sent down the air shaft instead of being hauled down the mountain side for nearly 5 miles and taken in through the tunnel. A sawmill is also to be erected near the shaft. The air pipe, of which there are several miles, will be taken out as soon as the shaft is completed and will give more room in the tunnel. The shaft is now down 120 feet. The Hidden Treasure is a drift gravel mine, has 1700 feet of flume and washes 100 tons of gravel per hour under 250 inches of water. H. T. Power is manager.

The Three Stars and Almont mines, under management of B. F. Hartley, at Ophir, reports progress. The Three Stars shaft has a hoist run with compressed air, while the Almont is a direct-connected water hoist. The ore is hauled on an electric road to the mill in Doty's ravine. Successive floors contain the rock breaker, self-feeders, battery, concentrators, dynamos and air compressors. The sulphurets are sacked at the mill, hauled to Lincoln and sent to the smelter. The mines employ seventy men and 3000 tons of quartz are crushed per month.—The Big Pine mine is near Baltimore ravine, at Ophir, and an Eastern development company is opening up the mine by sinking shafts and running levels. Hoisting and milling plant will be built, says the Placer Herald. Power drills have been put in.—Manager P. Lozano is opening up the Bellevue mine, in Ophir district. The mine is owned by P. Lozano, F. E. Brye, S. Bartlett and A. L. Smith.

### Plumas County.

The Robinson mine in the Granite basin, near Letter Box, 42 miles from Oroville, Butte county, will be worked, says Superintendent Oleson. Supplies are being taken in.

### San Bernardino County.

At San Bernardino, San Francisco men have incorporated the Out West M. Co., which controls mines on the desert. G. E. Bailey, A. E. Moore, W. J. Roth, G. Hubbel, W. C. Bailey, R. F. Bell and S. Dickson are incorporators. Their property shows a ledge carrying free milling ore, which also is said to carry a percentage of copper.

### Shasta County.

(Special Correspondence).—Last spring B. S. Cone and W. A. Fish of Red Bluff, Tehama county, bonded 840 acres of ground along Cottonwood creek to the extent of 4 miles, and about 6 miles south of Igo postoffice. The banks of the creek average 17 feet from surface to bedrock, which is soft slate. This ground has been prospecting by shafts and extensively by a Keystone drill. It is expected a dredge will be placed in the creek.

Igo, Oct. 11.

(Special Correspondence).—About 5 miles southeast of Harrison's gulch, near Redding, J. Wilson, C. Trede, A. J. Bogart and E. Blossom of Red Bluff are prospecting and developing two claims, through which runs a ledge 3 feet in width. A crosscut tunnel in 300 feet opened the ledge. Connection to surface will be made to have ventilation. A double-compartment shaft is being sunk in the ore shoot at breast of tunnel. Ore assays \$20 per ton in gold. The ore is

similar to that of the Midas mine at Harrison gulch. E. Blossom and A. J. Bort own the adjoining two claims or extension.

Cleanup of a week's run of the 2-stamp mill on the mine near Whiskeytown under Superintendent Cross amounted to eighteen ounces of gold. This was of ore from the ledge in the 300-foot tunnel at a depth of 300 feet below the surface. Stopping this winter will be from the tunnel to the surface. The ore is free milling, averaging \$8 per ton.

Redding, Oct. 12.

(Special Correspondence).—The Shasta County Q. & P. M. Co., with headquarters at Corning, Tehama county, was incorporated this summer and acquired, by location and purchase, 350 acres of ground near Whiskeytown, embracing the Murderer's Gulch mines. The banks are from 5 to 20 feet in depth to bedrock and the holdings cross Clear creek. Gold is found through all portions of the dirt and gravel. Clear creek is a swift-running body of water and the company has made application to the Debris Commissioners for permit to use it, as the Sacramento river is 12 miles away. Since July a ditch 11 miles in length has been built, with little fluming. From ditch to working ground is 200 feet and by piping a fall of 500 feet can be had. The officers of the company are J. R. Bryant, president; S. W. Kincaid, vice-president; C. W. Davis, treasurer; P. J. Newton, secretary.

Redding, Oct. 12.

#### Sierra County.

Mining operations are being started at Forest City, reopening the South Fork gravel mine. It has been idle for several years. There is a tunnel 3400 feet in length and it is proposed to drive this tunnel ahead to open the channel. F. W. Kuhfield of Forest is in charge.

#### Siskiyou County.

(Special Correspondence).—W. S. Maggard of Corning, Cal., and Dyer Bros. of Gazelle are owners of a group of three claims and 160 acres of railroad land adjoining on the west and south of the Dewey mine. The formation is granite and gabbro, with ledges 20 feet in width. The main ledge has a course north and south and the others trend northeast and southwest, converging to the main ledge. Development comprises two tunnels, 140 feet each, and several shafts 30 to 60 feet in depth. The ore is free milling, with values of \$30 per ton in gold. W. S. Maggard is sole owner of 200 acres of railroad land, near the Dewey mine, and through it runs a 40-foot ledge of free milling ore. A crosscut tunnel tapped the ledge at 200 feet in and at 150 feet below the surface. Drifting shows shoots of ore assaying \$10 to \$20.

Gazelle, Oct. 11.

A. C. Brokaw and associates of S. Attle, Wash., have taken up the bond on the Advance mine, on Russian creek, reached from the Oregon side. The consideration is \$70,000. The mine will be fully developed and a milling plant built. A tunnel is being driven to tap the ore body at depth. The ore carries free gold.

On south slope of Siskiyou mountains, midway between Happy Camp, Cal., and Waldo, Or., is the camp of the Ricoro G. M. Co., G. G. Mullins, manager. The company is operating the Classic Hill mine and adjoining properties, and has 600 acres of placer ground in one body. A sawmill has been built and they are cutting 10,000 feet of lumber daily and flumes and buildings have started. Three miles of wagon road have been made, extending to the country road on Indian creek. The old ditches, 1½ and 5 miles long, have been cleaned out and enlarged, and he has men at work putting in new flumes. The pen-stock has been completed and pipe line laid. They will have 375 feet pressure and good supply of water out of west fork of Indian creek. The timber used is mostly of white cedar.

R. S. Fagundes and M. Joseph will start work on the Live Yankee mine at Rollin. They have high-grade ore at the mill, to be crushed as soon as water can be obtained to run the mill.—Reed & Ball, owners of the Ida May mine, have men doing development work and getting ready for the water season. The mine is equipped with a 2-stamp mill, 1000-pound stamps. For the last three months' run the ore is reported to have averaged \$60 per ton.

#### Tehama County.

The Fitzgerald farm on Clear creek, northwest of Red Bluff, has been bonded for gold dredging purposes by R. E. Collins, W. D. Watson and A. Hurst. The farm consists of 2352 acres, and extends from the Sacramento river west a distance of 2 miles.

#### Trinity County.

First payment on the option on the Yellowstone mines has been made by M. Manley at Weaverville. The Yellowstone will be managed and worked in connection

with the adjoining Enterprise group of mines.

#### Yuba County.

R. E. Craustor, W. C. Hendricks et al. of Sacramento have bought 1280 acres of dredge mining land at \$100 per acre. The land lies in the Yuba River bottoms and is being mined by the W. P. Hammon Co., which has two dredgers at work and four more under construction. The buyers will put two dredgers at work.

### COLORADO.

(Special Correspondence).—The case of the Interstate Mercantile Co. against the Mine Owners' Association of Cripple Creek is on trial before Judge Marshall. The Mercantile Co. brought an injunction against the Association to prevent them from interfering with their business. The Mercantile Co. is said to be a Western Federation store.

Judge Owers of Leadville took the question of enjoining the Leadville District Mining Association under advisement. It is expected he will render his decision next week. In the meantime the operators are enjoined from putting the card system into use in the district.

The trusts have announced new treatment rates for the Cripple Creek district as follows: Up to half an ounce, \$5.75 per ton; one to one and a quarter ounces, \$8 per ton; one and a quarter to one and a half ounces, \$8.25 per ton; one and a half to two ounces, \$9.25 per ton; two to three ounces, \$10 per ton; three to five ounces, \$10.50 per ton. On high-grade ores carrying values of \$100 or above, a flat rate for treatment will be made plus freight to destination—Denver, Pueblo or Leadville. The freight rates to these points are the same and do not affect the producer. The open or miscellaneous rate will be \$1 per ton, on each and every grade, higher than the contract rate given above. The schedules as set forth apply to all shipments made on and after October 10 and carry with them the withdrawal or cancellation of all special rates which have applied heretofore.

The trust has reduced treatment charges on ores coming from Gilpin and Clear Creek counties, with a view, it is understood, of forcing the independent plant at Golden to withdraw from the field. The independent people state they have made several contracts for large amounts of ore and that the miners and operators are standing by them. They claim to have an outlet for their matte through an Eastern concern, the trust refusing to buy their matte.

Denver, Oct. 10.

#### Boulder County.

(Special Correspondence).—During the past summer the old camp at Caribou has renewed activity. The railroad being run from Sunset to Eldorado passes within 1½ miles of Caribou, and when the Colorado & Northwestern R. R. Co. is ready to operate its branch line it will save a long haul from the mines to Boulder.—H. D. Williams has a lease on the Mount Vernon mine and has opened up a body of \$35 ore at the 40-foot level. Occasionally he gets a pocket that runs 12,000 ounces in silver. The parties operating the St. Louis group are working twenty-five to thirty men and operating their 10-stamp mill. They have 11 feet of ore that runs \$8 per ton. A large percentage of the values is caught on the plates and the balance in concentrates.

The Anchor tunnel is in 500 feet in ore which carries gold and silver. They have sunk a winze 58 feet, and in ore the full size of the winze. The ore averages \$100 per ton.—The Isabel mine has a shaft down 120 feet, showing 14 inches of ore that runs \$200 per ton.

The Old Caribou mine is under lease to Munn & Co. of Denver, C. Carroll manager at the mine. The company will put in an air compressor plant.

The Poor Man mine, which has been idle, is reported ready to resume operations.

Caribou, Oct. 9.

#### Chaffee County.

Shipments of ore have started from the Mercury mine in North Cottonwood mining district, near Buena Vista. This mine has been in operation for eight years. It is intended, says C. I. Sharpe, manager and superintendent, to place more men to work.—Machinery is being placed in position on the Be True mine in Trout Creek mining district at Schwanders, near Buena Vista, owned by N. A. Stratton.—A. Closs, manager and superintendent of the Eureka mine in South Cottonwood district, says he will place men to work. It is intended to start a tunnel farther down the mountain.

#### Clear Creek County.

At Idaho Springs during month of September the Central tunnel was driven 188 feet by Contractor Knowles, making total distance from portal to breast on October 1 of 4179 feet. The Shafter vein will be reached by the tunnel this week and work

will be started on drift to reach a point under the shaft, after which connection will be made with shaft by raise. During September the Home M. & L. Co. drove the east drift on the Edgar vein 62 feet. In the stope they have a 2-foot streak of smelting ore, which is being broken down with machine drills. The raise to connect with bottom of Edgar shaft is driving. A switch and side track have been put in which will facilitate handling of ore and waste. The raise is started in the west drift from main tunnel.

#### Gilpin County.

A two years' lease and bond has been given to J. Beal et al. of Denver on the Smuggler claim in Moon Gulch district, near Rollinsville, and development work started. It is being opened up by shaft and tunnel workings and they expect to ship ore.—The Pronunier mine at Wide Awake has been leased and bonded for one year to E. H. Jeffries. The option calls for sinking shaft 100 feet and driving levels for 200 feet. The property has been idle for several years on account of water inflow. There is a steam plant of machinery.

#### Gunnison County.

(Special Correspondence).—On Quartz creek, ½ mile from Pitkin, A. E. Van Dusen has a lease on the Red Jacket mine. He has sunk a shaft 90 feet and is drifting to strike the contact. The drift will be 200 feet in length. The contact runs north and south. The ore lies between blue and dolomitic lime, with the dolomite on the hanging wall. J. A. Grant is manager.

Pitkin, Oct. 10.

(Special Correspondence).—A. Lajune is driving the Blistered Horn tunnel to cut the Jimmy Mack vein. He has cut one vein, which is 16 feet between walls, at 450 feet depth. The Jimmy Mack has produced \$700,000. Manager Lajune intends starting another tunnel about ½ mile from this property and will put in an air compressor and air drills. The group is on West Gold hill, 12 miles from Pitkin and 18 miles from St. Elmo. Quartz is the shipping point on the Colorado & Southern railroad, which is 9 miles from the mine. They are making 3½ to 4 feet per day in the tunnel by hand. When completed the tunnel will be 3000 feet long and is now in about 1200 feet.

Tincup, Oct. 9.

At Bowerman the Gold Cross and Camp Bird properties, on Copper mountain, are developing free gold veins and a stamp mill to handle the output will be built. On the Gold Cross dump there are 150 tons of milling ore carrying \$50 per ton in gold. This has been extracted in sinking the shaft 28 feet. The Camp Bird vein is ½ mile southeast of the Gold Cross and is larger. Manager G. Brant is putting in a hoisting plant and a stamp mill on Quartz creek, below Pitkin. A wagon road will be built. The Gold-Cross M. & M. Co. has been incorporated to operate the properties.

#### Jefferson County.

On Clear creek two gold dredgers are nearing completion at Placer, 2 miles east of Golden on the line of the Northwestern Electric Railroad. The boats are 110 feet in length by 42 feet wide, and draw, when loaded with their machinery, about 7 feet. The capacity of each is 2000 yards of gravel in twenty-four hours, and it is claimed that expenses of operation can be paid with gravel that yields 3½ cents per yard. The power for operating the machines will be electricity, the poles and wires being already in place. The weight of the equipment of each dredger is about 375,000 pounds. The cost of each dredger, equipped and ready to operate, is given at \$80,000. The National Dredging Co. is owner and operator.

#### Lake County.

The month of September in the Leadville district was one of normal production. September is the month when the large producers do repair work before snow falls, and the Moyer mine took advantage of that to retimber one of its shafts and to put in a new gallows frame. The Yak tunnel changed from the system of steam and mule power to electricity. However, the output for the month reached 70,000 tons of all classes of ore. There were several new strikes. The production of the Yak and other properties tapped by that tunnel was maintained at usual figures. The zinc output of the camp reached 8000 tons.

The Yak tunnel of the Yak M., M. & T. Co. at Leadville, started in 1889 to give the Silver Cord mine an outlet into California gulch, is in 11,000 feet, with several miles of lateral workings. Its head is at the bottom of No. 4 Ibox shaft, at a depth of 1250 feet from the surface. It serves the Ibox M. Co. for drainage and transportation. Diamond drill prospecting has been extensively used by the Yak Tunnel Co., leading to the discovery of sulphide ore bodies, later developed by laterals and shafts. The tunnel has two

such interior shafts or winzes equipped with hoisting plants. The output of the tunnel varies from 3000 tons to 6000 tons monthly. Shipments will, however, increase, as electric haulage has been installed. The ore is divided into two principal classes—lead and iron sulphides in one and zinc sulphide the other. A mill is being built to concentrate the low-grade zinc ore. A. K. Meyer of Kansas City, Mo., is largely interested.

#### San Juan County.

An electric power plant will be built at the Highland Mary mine, near Howardsville. The power to generate the electricity comes from the water supply at head of Cunningham gulch. The capacity of the plant will be 250 H. P., says G. M. Seeley, superintendent. Other improvements will be made.

The Pride of Eureka mine, at Eureka, owned by B. O'Driscoll, was crosscut by Blucher tunnel last week, which is being run by J. L. Estey. The point of intersection was 260 feet with a 300-foot depth, and the vein, low grade, is suitable for milling. The Pride of Eureka and the Blucher tunnel are on Eureka mountain, near the Upper Sunnyside mill.

A tramway is being built at the Neigold mine, Galena mountain, near Silverton. About 1000 feet of the 4000 will be of the Bleichert pattern, the remainder to be two "jig backs" of 1000 and 2000 feet each, which in total connects No. 2 and No. 7 levels of the Galena mountain properties with the landing at the base of mountain.

#### Summit County.

The Colorado & Wyoming Dev. Co., operating on Mineral hill, near Breckenridge, is shipping forty tons of zinc ore to Canon City daily, also a daily product of ten tons of smelting lead ore. The company keeps from four to six teams on the road and employs twenty men.

The Old Union M. & M. Co., near Breckenridge, is increasing developments with thirty men. The Smith shaft is being sunk and drifting down on a new ore shoot 65 feet east from the Montgomery shaft at the 150-foot level. A foot of galena and partly oxidized lead ore is reported. Other levels show smelting ore. The company is driving a 1000-foot tunnel to cut at greater depth ore bodies opened up in the shafts. A concentration mill will be erected by the company at the mouth of the new tunnel.

The capacity of the Mt. Quandary mill, near Breckenridge, will be doubled, and a tramway constructed between mine and mill, says Director Strickler, of the Mt. Quandary Co.

#### Teller County.

At Cripple Creek, S. Morris et al., who have a lease on the Red Umbrella property on Raven hill, have opened up a body of ore in an abandoned shaft at depth of 150 feet from surface and shipments will resume. The vein shows width of 5 feet with average values of two ounces gold per ton. The lessees expect to put in a plant of machinery and increase work of breaking and hoisting ore.

Wyatt & Burnside, who have a lease on the Burns mine of the Acacia Co. at Cripple Creek, have started drifting at the 400-foot level under the Fitch workings. They also are driving on the Wrockloff cross vein to cut extension of the Big Emma vein. They will put in an air compressor.

Cripple Creek reports say the production for month of September exceeds by nearly \$200,000 the heaviest production since the recent strike and indicates that the camp is now producing at a rate of \$24,000,000 per year. This, too, in view of the fact that the Telluride mill at Colorado City was closed down and the production from that source alone shows a decrease of \$100,000. In addition the Dorcas mill at Florence shut down a part of the time owing to repairs, as was also the case in the Sioux Falls plant. The smelters showed a large increase. The total value was increased largely through the Economic mill treating ore from the W. P. H. mine which averaged \$90 per ton. From that property less than a ton of waste is picked out of the ore that is hoisted in a week's time, and the lessees are breaking ore 35 feet in width. Since the strike was started thirteen months ago the output of the camp has been steadily increasing until to-day it is normal, and it is expected that October will show a larger output than September. This can be accounted for by three cyanide mills which will be running during the month that have not been running previously. The Golden Cycle mine will also double its production. The production of September shows increase over August in valuation, but a falling off in tonnage. In August 61,940 tons were treated with a valuation of \$1,790,620. The decreased tonnage is due largely to the fact that the Sioux Falls cyanide mill was closed for the greater part of the month. With this month's figures the total for the nine months of 1904 amounts

to \$16,068,420. The following table is individual statement by the mills and smelters for the month:

Plants—	Tons.	Total Value.
Smelters.....	12,000	\$730,000
U. S. R. & R. Co.....	22,000	660,000
Portland.....	7,500	225,000
Economic.....	2,750	137,500
Telluride.....	3,500	122,500
Dorcas.....	1,900	66,500
Homestake.....	6,000	24,000
Florence cyanid. mill.....	2,700	13,500
Wild Horse.....	2,000	12,000
<b>Totals.....</b>	<b>60,350</b>	<b>\$2,041,000</b>

The production for nine months is:

Month—	Tons.	Total Value.
January.....	51,500	\$1,753,000
February.....	54,500	1,635,000
March.....	54,300	1,743,000
April.....	58,800	1,851,400
May.....	60,500	1,895,800
June.....	52,700	1,607,000
July.....	51,000	1,714,000
August.....	61,940	1,790,620
September.....	60,350	2,041,000
<b>Grand totals.....</b>	<b>505,590</b>	<b>\$16,068,420</b>

At Cripple Creek all the water-flooded mines have been so far drained as to justify deepening the shafts, and the driving of new levels. Bodies of payable material have been opened and partly developed in the last six months. Before the strike of 1903, the Cripple Creek tonnage ran from 35,000 to 50,000 tons per month. Now it reaches over 60,000, with all the older mines in producing condition and new ones brought in. Some of the principal producers in September were: The Vindicator mine on Bull hill sent out 1850 tons of ore, average value \$50. The leasing company operating the Gold Sovereign sent out forty tons per day, average value \$40. From the Doctor-Jack Pot Con. property twelve sets of lessees sent out over 1000 tons, average value, \$50. On the Mabel M. of the Gold Dollar Con., the Milwaukee M. Co. shipped out 220 tons, average value \$40. El Paso, on Beacon hill, sent out fifty cars, returns amounting to \$100,000 for the month. El Paso Co. is employing 165 men, of whom the greater portion are working in ore. The company is also doing development work in the sixth, seventh and eighth levels besides sinking the shaft. The average value of ore runs \$90 per ton. On same estate lessees are sending out two carloads of ore per day, average value \$40 per ton.

Cripple Creek reports say the Blue Flag Co., operating on Raven hill, has resumed operations on the Blue Flag claim and will increase development work. The company has resumed sinking the shaft to the 200-foot point. J. F. Erisman has management of the property.

The Gold Coin Co., which is operating the 11th level of the Gold Coin property, in Victor, is stopping the ore bodies. The ore will be sent to their mill through the tunnel. The Gold Coin mine is operated down to the 10th level by lessees, nearly all of whom are sending out regular shipments of good grade ore. Returns from last shipment of the Stewart lease, operating between the 5th and 6th levels, gave values of \$1000 per ton.

The cyanide mill under construction on the Anaconda mine, at Anaconda, is completed, and the owners, King and Craig, expect to start operations this week.

The Cripple Creek Gold Temple M. & L. Co., working on the Gold Sovereign mine, Cripple Creek, during month of September shipped out average of forty tons of ore per day, which gave returns of two ounces in gold per ton. The company is employing seventy-five men. The shaft is being sunk under contract from 625 feet to 700 feet. A crosscut will be driven south 200 feet.

The Vindicator mine, on Bull hill, at Victor, shipped out during September 1850 tons of ore, average value \$50 in gold per ton. The property is working 135 men, which includes those employed by lessees.

R. B. Woodworth has taken charge of the Gillett cyanide mill at Gillett and will resume treatment of ores.

Among the cyanide plants operating successfully in Cripple Creek district, says the Gazette, the Sioux Falls Co. has a mill on the Fluorine property, on Copper mountain, making a saving of 90% on ores running \$4 to \$12 per ton, treating same at cost of \$3 per ton. Another company is operating on the Magna Charta mine on Ironclad hill. The managers, after working only a short time with a 200-ton mill, started building a plant five times the size, which is progressing. Machinery has arrived and foundations are being put in place for tanks and buildings. Other plants of the same character have been erected on the Lincoln at Gillett, the Anaconda near Anaconda and the Wild Horse near Midway. The Gillett and Wild Horse mills are in operation.

The number of recommendation cards issued by the Mine Owners' Association approximates 5400, says the Cripple Creek Times. The first card was issued April 1. It is estimated that 4800 men are employed throughout the camp. The Hull City, Theresa and the Stratton estate are

working but a few men, but when the properties are opened up 600 or 700 more men will be put to work.

## IDAHO.

### Idaho County.

A. Allardye of Chicago, Ill., manager for the Big Idaho M. & Dev. Co., owning holdings in the Big Creek district, between Dixie and Buffalo Hump, says he will increase development. The company owns 980 acres of undeveloped placer ground for 6 miles along Big creek. In addition it has eleven quartz claims with 1000 feet of tunnel work.

### Latah County.

J. W. Sherer, superintendent of the White Cross M. Co., on Moscow mountain, near Moscow, reports a strike. In driving the tunnel to tap the main ledge 300 feet below the upper workings, they cut a blind lead that contains payable ore. An air compressor is being set up.

### Washington County.

R. H. Kleinschmidt of Helena, Mont., interested in the Peacock, the Helena and the White Monument mines in Seven Devils district, near Mineral, says they are being worked under lease by C. W. Jones and are showing well. The Blue Jacket group is being worked by the company of which S. Dorsey is manager, and ninety-seven tons of copper mined from the Blue Jacket in August netted the company \$6000. The Queen, in same group, shows face of ore 15 feet wide that averages 5% copper.

## MICHIGAN.

### Keweenaw County.

The Mohawk mill, near Allouez, is running to full capacity. There is room for a fourth stamp, which will be put in. The mine is furnishing 1500 tons of rock daily.

## MISSOURI.

The output of the Joplin lead-zinc district (including southeastern Kansas and northwestern Arkansas) for the nine months of 1904 ended Sept. 30 is reported by the Joplin News-Herald at:

	Pounds.	Value.
Lead.....	48,702,560	\$1,324,450
Zinc.....	386,719,490	6,500,790
<b>Total value.....</b>		<b>\$7,825,240</b>

## MONTANA.

### Madison County.

The mill at the Revenue mine, near Pony, is expected to be finished this week. The ditch from North Meadow creek, which will supply the water for the mill, has been completed, also work on the power line from the Madison Canyon Power Co. plant.

### Powell County.

At Emery, near Deer Lodge, the concentrator is about finished. The hoist at the works of the Montana United M. Co. is working. The shaft is down 300 feet and a station being cut from which a crosscut will be run to the lead, says Superintendent H. I. Cobb.

### Silver Bow County.

Butte reports say the Mountain View mine, owned by the Boston & Montana C. & S. M. Co., will be equipped with a hoisting plant capable of working to depth of 3000 feet and is also to have another battery of boilers. Work of putting it in place has started. The shaft on the Mountain View is 1800 feet deep. To supply the hoist with steam a battery of new boilers will be set 200 feet from the present battery, the location being near the railroad track east of the engine house. The steam will be piped from there to the hoisting engine. The Mountain View is well timbered and developed. It contains two veins of copper-silver ore. Its daily yield runs between 800 and 1000 tons of ore.

## NEVADA.

### Esmeralda County.

To build a railroad between Tonopah and Goldfield a company has been organized with J. Brock president, T. L. Oddie and C. G. Heller. At first it was thought that a railroad between the two places would not pay, but the development of mines at Goldfield and the demands of the traveling people are said to have made it necessary to extend the line to Goldfield. The new line has been surveyed and contracts for construction will be let.

Operations have been started at the Homestake mine at Silver Peak and grading for the mill has begun. C. H. Fuller, president of the company, says a 5-stamp mill will be set up with a cyanide plant. C. McCarthy is superintendent and E. Knapp will be in charge of the mill.

### Eureka County.

H. C. McTerney, superintendent of the Eureka Con. and Richmond mines in Eureka, says arrangements are being made to unwater those mines. Developments will be resumed.

### Lincoln County.

V. Dockleitch will put men at work on the Dockleitch mine, which joins the DeLamar-Bamberger ground, at DeLamar. There is one tunnel 600 feet, another 400 feet on a ledge that shows values. A 200-foot shaft also shows ore. It is now proposed to open up another vein that shows on the surface.

The Half Moon mine and mill at Pioche has been leased by Gordon and Nesbit, and leaching of ores on the dump will be started. Gordon says the rock will average \$8 gold with three ounces silver per ton. To recover this the mill will be equipped with cyanide leaching tanks.

Foundations are made for the two new batteries for the Quartette mill, at Searchlight. The increased milling capacity will necessitate other improvements, among them an electric tramway from the crusher in the gallows-frame to the mill. Work has started on the road-bed, which will be both broad and narrow gauge, the narrow gauge being for waste. The road will be equipped with 5-ton cars. Ore from the 700-foot level will be shipped to the smelter. The ore averages \$1 gold, 17% copper and 25% lead. A power grinder and sampler, run by electricity, are being set up in the assay office. A second raise is being run between the sixth and seventh levels, at 225 feet east of the shaft, says Superintendent Harrington.

H. A. Perkins, manager of the New Era M. Co. at Searchlight, says the company now has its pipe line completed and water is flowing from the Boland well to the tanks at the mill. By Nov. 1 the stamps will be dropping.

Caliente reports say J. J. Morrow of San Antonio, Tex., and G. D. French of Denver, Colo., have an option on the Lone Star group of gold claims on Virgin river for \$10,000. There are twelve claims in the group. Assays of \$30 have been obtained from an 18-inch vein of honey-combed quartz in a 35-foot shaft.

A. B. Hall will work the Quartette tailings at the river mill of the company, near Searchlight, on a royalty. It is estimated there are 16,000 tons in the pile, and 2000 tons a month is the capacity of the plant.

A 43-foot body of coal is reported found a few miles south of Virgin river, near Caliente, by McEntire and Forrest of Caliente, who have located four claims. The bed is near the line of the San Pedro Railroad.

### Nye County.

The South Tonopah M. Co. has changed the name of the company to the Tonopah-Wilmington G. M. Co. E. Hirschler, president of the company, has let a contract to sink a shaft on an oxidized quartz outcrop, which yielded values. A contract was also let to crosscut from present shaft. The company owns seven claims 3½ miles south of Tonopah, on the Gold Mountain road.

L. G. Wheeler et al. have incorporated the Wheeler Gold-Turquoise M. Co., which has bought the Dolores group of six claims at Ray, north of Tonopah, from which turquoise has been mined. The gems occur in a decomposed volcanic matrix, which also carries free-milling gold in values of \$12 per ton. Chicago, Ill., and Milwaukee, Wis., men are interested and work will be started next week.

At Tonopah the Free-Gold M. Co. hoisting plant, comprising a 15 H. P. gasoline hoist, having been set up and timbering of the shaft completed, sinking has resumed.

## NEW MEXICO.

### Grant County.

The Arizona & Colorado Railroad Co. has been incorporated to build a north and south railroad in western New Mexico with termini at Durango, Colo., and Clifton, Ariz. The company has filed on 20,000 acres of coal lands in western New Mexico and will have its headquarters at Tucson, Ariz. The road has been surveyed. A subsidiary corporation, the Arizona & Eastern Railroad, 50 miles long in New Mexico, and with headquarters at Lordsburg, is also incorporated. The coal of southwestern Colorado and western New Mexico is said to be wanted for the smelters at Clifton, Morenci, Bisbee, Nacosari and Douglas, Arizona.

## OREGON.

### Baker County.

A. P. Smith of Baker City has bonded the Emma claim, Cracker Creek district, for \$10,000. The property adjoins the Esmeralda and is across the gulch from the Mountain View. The Emma will be developed by a drift on the ledge and a shaft. Its ore bodies are large.

In the Greenhorn mountains, near Sumpter, the Heppner group of fifteen claims is owned and operated by the Heppner M. Co., D. B. Stalters of Heppner president and manager. On the Illinois a 6-foot vein of high-grade milling ore has been opened. It is intended to build a stamp mill. Ore has also been opened in

the Mayflower and in the Pride of Heppner.

### Clackamas County.

In Shena Creek mining district, 53 miles east of Portland, on a tributary of Salmon river, development work is being done. The district is 7 miles southwest of Mount Hood. The Northern Light M. & M. Co., composed of Clackamas county and Portland men, has run 600 feet in tunnels and work will begin on another, says A. Hornecker of Portland, superintendent. Assays show gold, \$1.44; silver, \$58; lead, \$10; copper, \$12. The officers are: President, E. Renfer of Portland; O. Meinig of Sandy, T. S. West of Portland. A small vein of ruby silver has been found on one of the claims. The group of eight claims owned by the company covers 160 acres. In addition they have a millsite and a water right, including a natural water fall.

O. F. Olsen of Portland, treasurer of the Financial M. Co., owning a group of quartz claims in Bald Mountain district, says \$16,000 will be spent in developing the properties. There are four groups of claims. The Esther shows 12% copper, \$3 in gold and \$6 in silver. A 3-foot vein is shown by an open cut 1400 feet below the apex. The Oklahoma has a vein 50 feet wide and averages \$5 per ton free gold. The main lode is a 10-foot vein, and shows 3% copper, \$4 in gold and \$7 in silver.

### Columbia County.

E. A. Sessions of Portland, of the Cascadia M. & Dev. Co., says a railroad will be built to the St. Helens mines. The road which promises to tap the mines is the Tacoma & Eastern, which has its terminus at Ashford, in northern Lewis county, 20 miles from St. Helens. Surveys have been made for the road. Coal properties belonging to the railroad in that district have been partially developed and show workable coal.

### Coos County.

Coquille reports say fire is raging in the coal mines of the Spreckels Brothers Co. at Beaver Hill, near Marshfield. The bulkheads have been closed. The fire had its origin in an explosion on the sixth level. The mine has only recently been developed and employs about 200 men. This is said to be the second experience of the company with fires at Beaver Hill. The old mine there, which was a producer, had to be abandoned on that account.

Gold in Coos county is reported by Superintendent Whitney of the Commandery M. & M. Co. of Seattle, Wash., which has 160 acres 30 miles south of Myrtle Point. It is said the ground runs 25 cents to the cubic yard. The company has two No. 3 giants with deflectors and other equipment. These will mine 4500 yards per day.

### Jackson County.

(Special Correspondence).—The Hawkeye-American mine on Lanes creek, 2½ miles south of Gold Hill, is being worked under management of L. T. Pockman. This is a low-grade proposition, the body of ore being 25 feet in width between walls of porphyry and slate. Development is by tunneling, with breast of tunnel 100 feet below the surface. Ore values average \$4 per ton free milling. San Francisco parties are principal owners.

The Shump mine on Lanes creek, owned by A. M. Allison of Iowa, is proving a high-grade proposition, as ore from a pocket gave returns up to \$1000 to the ton. Development is by 300 feet of tunneling.

Gold Hill, Oct. 11.

The Cohen mine of Sucker Creek has been bought by A. Gainer of Portland. Gainer has cleaned out the old workings, retimbered the tunnels and drifts, and is driving deeper into the mountain, uncovering a body of ore.

J. A. Whitman of Medford says he has bonded the Mixer placer mining property on Steamboat creek, in Sucker Creek section, south of Ashland, and is fitting it up for operation during the winter. This is a few miles north of the Briggs find. He has built a ditch.

### Josephine County.

(Special Correspondence).—In Galice mining district, W. H. Moore, N. P. Hansen and J. C. Mattson of Moro own four claims which are at 4000 feet altitude, in schist, the ledges being about 4 feet in width and the ore chalcocopyrite, assaying 25% copper, \$6 gold and \$1 silver. There are 350 feet of tunnels, the longest being 275 feet, beside several shallow shafts. Development is being increased.

The Rand M. Co. of Ballingham, Wash., owns five claims on the Big Yank ledge, in the Galice mining district, 20 miles west of Grants Pass and near Rogue river. The formation in general is diorite. Tunnels and drifting amounting to 1000 feet have been done, giving a vertical depth below surface of 300 feet. The ore carries values of \$17 gold and copper. The company platted a town site of 100 acres on

the banks of the river, and, with the sawmill in operation, erection of buildings will begin. The officers of the company are: F. J. Barlow, president; D. L. Smith, secretary and treasurer; L. B. M. Simons, manager.

The Galice Con. M. Co. owns 700 acres of gravel land along the banks of Galice creek a distance of 4 miles above its emptying into Rogue river, and in width varies from 600 to 1200 feet. The banks are from 6 to 20 feet in depth from surface to bedrock. Equipments include two No. 1 giants, two No. 2 giants and a Campbell hydraulic elevator. There are over 12 miles of ditching and 1000 feet of piping. The 4-mile ditch carries 2000 inches of water to near the river, where the elevator is set. By extending the ditch from the north fork to the south fork another elevator can be put in and the season lengthened. There is a sawmill plant in connection with the property. The company is composed chiefly of Portland men. A. B. Cousins is manager and E. F. Terry superintendent, at the mines.

Galice, Oct. 11.

At the Hammersley quartz mine in Jump-off-Joe district, between Jacques creek and Brass Nail gulch, near Grants Pass, the 5-stamp mill is ready for operation. F. H. Osgood is operator.

Transportation of ore from the Queen of Bronze and Lytle copper mines, which, with the Cowboy, are supplying ore for the Takilma smelter at Takilma, is to be solved by building a cable tram. Survey has proved the grade sufficient to operate a tram by gravity, says Manager C. Tutt. More bins are also being built at the smelter, both for ore and coke. Teams are hauling coke from Grants Pass to the plant, as it is desired that a supply will be on hand when the rains make heavy hauling impossible.

## SOUTH DAKOTA.

### Lawrence County.

The new shaft of the Hidden Treasure G. M. Co., on Deadwood gulch, near Deadwood, is 150 feet deep and still in ore. A temporary shaft house has been built and will suffice until the horse whim is replaced by a steam hoist, says W. Lawler of Lincoln, Neb., manager.

The Clover Leaf G. M. Co. with headquarters at Beulah, Wyo., and operating at Roubaux, proposes further improvements on its property, including additional stamps at its mill, increasing the capacity from 60 to 100 stamps. The main shaft is being sunk to the 1000-foot level, and to expedite this work without interfering mining a small hoist has been placed on the 700-foot level, to be operated independently of the main hoist. Heavier pumps have been put in. A Corliss engine has been set up in the mill and steam machinery will be set up for framing mine timbers. The present 60 stamps of the company are working and two clean-ups are made each month, says President P. Wibaux.

## UTAH.

### Davis County.

Manager Perkins of the Farmington group in Steed canyon, near Farmington, reports development work started. The tunnel will be continued to 1200 feet to cut the ledge at depth of 500 feet from surface. Gold and copper values are found in the outcrop. An air compressor and machine drills will be put in.

### Grand County.

Basin reports the Grouse Mountain M. Co., composed of Huntington, W. Va. men, is driving its tunnel to cut the McCoach vein. It has reached a depth of 350 feet and expects to crosscut the vein at 400 feet. J. H. McCoach is president. The company will build a 100-ton cyanide plant.

### Juab County.

The Beck Tunnel Con. M. Co., near Eureka, will put in an air compressor plant and will conduct a pipe line from Homansville to bring water to the mine, says President J. Knight of Provo. A winze is being sunk in the tunnel, following a shoot of copper-stained quartz, in which copper and silver ore occur. The winze is down 150 feet from the tunnel and 550 feet from the surface.

Ore shipments from Tintic mining district for month of September amounted to 467 carloads, the following mines being the producers:

Bullion-Beck	30
Gemini	83
May Day	3
Centennial-Eureka	150
Eagle & Blue Bell	29
United Sunbeam	13
Star Con.	1
Yankee Con.	18
Uncle Sam Con.	9
Lower Mammoth	2
Mammoth	63
Grand Central	71
Ajax	4
Victor	4
Carliss	7
Godiva	19
Osborne leave	1

South Swansea	1
Totro	2
Total, cars	407
CONCENTRATES.	
Uncle Sam mill	18
Eureka Hill	8
Total, cars	26

### Plute County.

Manager A. E. Hyde, Jr., of the Annie Laurie mine of Gold Mountain district, near Marysville, reports the mill is running.

At the Mammoth mine at Robinson the main shaft is down 1950 feet and will be sunk to the 2100-foot level. The mill has started. Sixty men are employed. The bins are full of ore and shipments of high-grade ore and concentrates will be resumed.

The J. A. Hunt fractional claim, embracing two acres of ground between the May Day and Uncle Sam mines, has been sold to the May Day company for \$2000.

A larger pump has been set up on the 1300-foot level of the Gemini mine at Eureka. The pump has capacity of handling 250 gallons a minute.

### Plute County.

(Special Correspondence).—G. F. Dalton of Marysville has men on development work at his group of iron claims, 3½ miles north of Marysville. The ore is hematite, of which there appears to be a large body.

J. S. Baler has a car of high-grade lead-silver ore ready for shipment from the Bully Boy mine. Work is being increased and regular shipments will be made.

H. Bradburn, manager of the Bradburn M. Co., operating on the south fork of Cottonwood, reports that men are working on a shoot of ore in the upper tunnel. —The Aldebaran, also in Cottonwood canyon, under the management of B. T. Ashby, is making satisfactory showing. A pocket of native gold and silver was opened up last month. Missouri men are interested.

The Wedge mine, in Horse Heaven district, has a body of high-grade ore. J. F. Lyons, principal owner, states that a bond and lease will be given to Eastern men.

L. W. Bartholomew is taking out ore from the Copper Belt mine. —The Standard group, on Bullion creek, which is under bond and lease, is showing up values. F. M. Haughey is the principal owner.

The Franklin & Gold Development Co., running two tunnels from the Cottonwood and Bullion creek sides, is increasing work. F. M. Murray is secretary and O. Larsen superintendent. —M. Munroe has a group adjoining the Deer Trail mine, which he is developing.

Arrangements are being made to put in a steam hoist on the Out of Sight group, owned by R. De Witt and New York men. —B. Reynolds and J. Blum have 3 feet of ore on South Bullion creek, and are putting up buildings preparatory to winter work.

In the Quicksilver mine at Marysville the ore carries selenide of mercury (tiemannite). Formerly this property was worked for the quicksilver values, which were high grade. The property was worked by a tunnel and the vein is a strong one, but, a fault having taken place, they failed to recover the vein and work was discontinued. Specimens of the ore are in demand for museums and colleges.

The Rio Grande Western Railway has its terminus at Marysville and the several mining districts are easy of access. Marysville, Oct. 10.

### Summit County.

Work on the Martin mines in Thaynes canyon, near Park City, is progressing under the supervision of A. F. Martin. The tunnel is being driven. Work will be continued during the winter.

A 30 H. P. gasoline locomotive is being built for the Daly-Judge Co. at Park City to replace the mules in hauling ore trains through the tunnel. Superintendent M. J. Dailey of the Silver King says if it proves successful he will put one or more in the Alliance tunnel.

Vice-president J. D. Wood says the shutting down of the Quincy hoisting works and connecting up of the lower workings with those of the Daly-West M. Co., at Park City, will make a saving in operating expenses of \$5000 monthly.

### Tooele County.

During September at the mill and mines of the Con. Mercur, at Mercur, bullion was recovered from 21,000 tons of gold-bearing rock which maintained a satisfactory average. At the Manning mill there were leached during the same period 400 tons of gold-bearing tailings daily. Operations will continue at this plant until cold weather makes it necessary to suspend for the winter. Conditions under ground, says Manager Dern, are satisfactory. Old ore channels have been tapped on lower horizons, the metallic average is satisfactory and the vol-

ume large. The payroll has been reduced and the cost of operation is less.

H. Hoersch, president of the Flying Dutchman Con. M. Co., operating in Erickson district, near Vernon, reports taking out copper ore carrying gold and silver values. The company has four claims at Sheep Rock, and more men will be put on development work.

Superintendent Galliger of the Stockton mine, at Stockton, reports construction on the mill progressing.

The Wild West M. Co. of Provo has been incorporated by S. K. Roberts president, J. K. Bishop, M. Trope et al. of Provo. The company owns mines in Erickson district, near Vernon.

## WASHINGTON.

### Chelan County.

Near Chelan supplies have been shipped into the Junk group of mines on Park creek, owned by J. T. Davis and J. Donahue of Tacoma. They have a tunnel which will be continued to crosscut the ledge at depth of 200 feet. The ledge is 10 feet wide, carrying silver-lead values. A smelter and drills will be put in.

### Ferry County.

J. L. Harper et al. of Spokane propose to build a smelter on West Fork of San Poil river, 14 miles from Republic. Start will be made with a copper matting furnace and a lead stack.

E. L. Tate et al. have bonded the Copper Key mine, near Republic, and are shipping ore. A mill will be built.

Near Keller, the Manila has been sold to J. L. Harper et al. The ore is of copper, with gold and silver values.

Shipments are going out from the Belcher mine at Republic, says J. L. Harper, resident manager. They will haul ore until the rainy season sets in, discontinue until the snow season, then resume and get out a heavy tonnage of ore while sleighing lasts. They will begin tests in concentrating the gossan that overlies the Belcher vein. A hand jig will be put in, while concentrating tests will be carried on at Spokane. The gossan, which is of red oxide of iron, is several hundred feet in length, about 80 feet in width and 100 feet in depth, and will return \$3 per ton in free gold, says Harper. —The Copper Key mine, owned by E. L. Tate et al. of Spokane, is delivering sixty tons of ore per day at the Lambert railroad siding.

Near Keller, the Keller & Indiana Con. S. Co. is building a dam across the San Poil river. The houses, blacksmith shop and sawmill have been completed.

### Okanogan County.

Conconully reports say at the Mineral Hill mine an air compressor has been put in and machine drills are in operation. An ore crusher to handle 200 tons daily is another addition. An engine house, 26x36 feet, containing the boiler, air compressor, fans, etc., has been built. A lathe and a complete outfit for a machine shop will be put in. Near the mouth of the tunnel two ore bins have been erected. Below these and connected by chutes are the crushing plant and store house. A pump will be lowered in the winze and work there continued, says Manager J. May of Bridgeport, Conn. —R. R. Hargrove, manager of the Mineral Zone property, 2 miles west of Conconully, has development work under way. —Work on the Salmon River M. Co. property, on Peacock mountain, is progressing and ore is being produced, says Manager Hutchinson of Spokane. This property adjoins the Ruby mine.

C. H. Morrison and R. L. Platt of Denver, Colo., hold an option on the Yankee mine, near Methow, and will start operations this month.

### Pierce County.

The report for month of September of the Tacoma Smelter Co. at Tacoma shows imports of ore amounting to \$208,827.35; merchandise, \$1340; lime and limestone, \$2295. Exports in the form of furnace products amounted to \$334,862.39. The company is at work on a plan by which it can save the mineral lost in the smoke from the chimneys, as about \$20,000 a month is said to be lost in this way, besides the residents near the smelter complain about the smoke killing trees and shrubbery. The company expects to filter the smoke, so as to catch and save the mineral.

## WYOMING.

### Albany County.

(Special Correspondence).—The Hecla M. Co., about 25 miles northwest of Cheyenne, at Granite canyon, has opened up high-grade copper smelting ore in the 160-foot level. Two shifts are working. They will overhaul the mill and resume ore treatment. The company intends remodeling the smelter, which has been idle. H. Schwartz is president and manager. Hecla, Oct. 9.

At the Keystone mine, near Holmes, the Ideal M. Co. is putting in machinery.

A 100-stamp, a 500-ton cyanide plant, an electrical plant and a sawmill will be installed.

### Carbon County.

It is said the Battle Lake T. S. M. Co., operating the Doane & Rambler mines at Rambler, will build a reduction plant. Water and fuel supplies are at hand. J. L. Powell is superintendent. —The Dill G & C. M. Co. has put in a boiler and hoist at its mine north of Rambler and is sinking a two-compartment shaft.

Dillon reports say the Anchoria (Kel-say) mine, 2 miles below Copperton, near Dillon, will be further developed. The company will sink the shaft to determine the extent of the vein. The Anchoria dump is said to contain copper values. H. O. Granberg, principal owner, is director and manager. A whim is being used for hoisting.

### Sheridan County.

The Carny Coal Co. mines, 5 miles from Sheridan, have been opened up and 500 miners are at work. A daily output of 1000 tons is being made. An electric railroad system, 150 houses and other equipment in connection with the camp have been completed. The mining plant has a capacity of 2000 tons a day, and the output is to be increased to this amount.

## FOREIGN.

### AUSTRALIA.

#### Queensland.

The Dee River gold field the first of September completed its first year of existence. The total weight of nuggets reported found is 4350 ounces, of value of £18,000.

#### Western Australia.

The Lake View Consols mine, at Kalgoolie, during the past fiscal year treated 101,960 short tons ore for 51,431 ounces fine gold. The tailings during that time were brought down to average of 1 dwt. 16 grs. per ton. The cost of treatment was 14s 10.29d per ton, and the total working costs 17s 7d per ton; whereas the costs for the preceding year were 23s 7d per ton.

### BRITISH COLUMBIA.

#### Boundary District.

S. Curtis of Rossland and Grand Forks men have organized a company to operate the Strathmore mine, on which the company has a working bond. Considerable development work has been done. Ore values are in silver and gold.

At Greenwood the Montreal & Boston C. Co. has blown in two furnaces and a third will be installed. Ore is coming in from the Brooklyn, Stenwinder, Rawhide, Athelstan and Sunset—all the company's holdings. The ores vary in character, and will be shipped in proportions to make a desirable smelting combination and a high-grade matte.

The Dimond Fraction claim, east of and adjoining the Providence mine at Greenwood, has been sold to the Providence M. Co. The Providence main lead is said to have been traced to the line of the property.

#### East Kootenay District.

In Windermere camp the Paradise continues working full number of men and several teams are hauling ore to the river landing. Manager H. C. Hammond and Engineer S. S. Fowler will build a concentrator and a 4-mile tram from the mine to Pinehurst this fall. —P. Farnham, manager of the Ptarmigan mines, expects to operate it again this winter. Six properties are working. The Delphine, leased by Stoddart & Beatty, is shipping eighty tons of high-grade ore. P. Mickelson is working the Tilbury mine. Forty tons of ore are on the way to the smelter. The Pretty Girl, the Tecumseh, the Charlemont and the Bunyan are shipping. Other properties are doing development work. —The Lead Queen group on No. 3 creek has been bonded to B. F. Holcomb for the American P. & T. Co. of Boston, Mass., for \$75,000, in payments covering two years.

#### Rossland District.

At Rossland the Rossland Power and the White Bear concentrators have under way flume lines that will solve the water supply problem for both mills and will largely increase the daily average of ore crushed. The Spitsee mine has concluded its treatment arrangements and will start mining on a larger scale. The force will be increased to thirty men. The Velvet-Portland mine has a 50-ton addition to its concentrator under way.

#### Slocan District.

A lease and bond on the Cowboy and Texas group of claims on Spring creek, near Kaslo, has been taken by H. Newcomb, D. W. Moore and J. A. Whittier for \$20,000. Work has started.

T. McGuigan, manager of the American Boy M. & M. Co. at Sandon, says he will start up the mine, and will put on men as soon as supplies are packed in. The

American Boy has been closed down since spring.

#### Vancouver Island.

The Britannia C. Syndicate, Ltd., at Howe Sound, near Vancouver, G. H. Robinson of Salt Lake City, Utah, manager, reports work progressing on the aerial tramway and other equipment. Water power under 1000 feet head will be used, direct-connected to two 3-phase alternating current, 200 kilowatt, 6600 volt generators. The transmission line will be 3 miles long. Ten induction motors will be used, the largest being 150 H. P., which will drive the compressor. An electric locomotive will haul ore and freight between the ore bins and the dock.

#### West Kootenay District.

A strike of ore has been made on the Silver Dollar group on Mohawk creek, 3½ miles from Camborne. The Silver Dollar group consists of three claims and two fractions comprising 175 acres, which is well timbered. The group is owned by the Elwood Tinworkers G. M. Co. of Elwood, Ind., and development work is progressing. Four separate leads are reported opened, each carrying payable values in gold and silver. A compressor plant is being set up.

T. E. Erehart of Schenectady, New York, manager of the Lucky Boy mine at Trout Lake, in the Lardeau section, says he is resuming operations. The ore carries lead and silver values.

In the Lardeau the mill at Five Mile, owned by the Silver Cup Mines, Ltd., has been hampered from shortage of water, due to unusually dry season. However, water has been obtained from the creek which runs near the mouth of the Nettie L. lower tunnel by a series of dams, flumes and ditches to the mill, a distance of 1½ mile. The twenty stamps are dropping steadily and more men are being put on.

#### CANADA.

##### Ontario.

Near Wabigoon mining operations will resume at the Big Master mine, says Superintendent Shovell, and he has started preliminary work.—At the Ideal mine in same belt, mining operations are progressing with satisfactory results. The shaft has reached 95 feet, from the bottom of which ore carrying free gold has been taken.

#### MEXICO.

The mining products of the republic during fiscal year 1903-1904, says the Chihuahua Enterprise, amounted to \$150,000,000, divided as follows:

Silver	\$82,300,000
Gold	32,500,000
Copper	19,600,000
Lead	6,600,000

During the past three years Mexico has exported, mainly to the United States and the Far East, over \$21,000,000 gold, \$128,000,000 silver (gold value) and \$400,000,000 of other metals (gold value).

##### Chihuahua.

J. Lago has made "blanket" denouncement on 25,000 pertenencias (about 60,000 acres) between Placer de Guadalupe and Placer de Santo Domingo on the Conchos river, near Santo Domingo, to prospect for emeralds in the volcanic rocks. Aqua marines (an inferior beryl) are reported found in the volcanic pumice.

The Calera M. Co., near Minaca, is shipping zinc ore to Colorado.

The Encinillas M. Co. at Ciudad Camargo will increase its machinery equipment.

##### Durango.

The American Mexico M. & Dev. Co. is grading for its 200-ton plant at Velardena and expects to start the plant by Feb. 1, 1905, when the company will do custom work as well as treating its ores.

The smelter of the Luster M. Co., which operates a gold-copper group at El Oro, has been blown in. It has a daily capacity of 150 tons.

The American M. Co. has been organized at Victoria, Tamaulipas, to operate the Fauro mine, covering fifty pertenencias, adjoining the Penoles M. Co. at Mapimi.

More machinery will be added to the equipment of the Mexican Con. M. & S. Co. at San Pedro. D. McVichie of Salt Lake City, Utah, is consulting engineer.

##### Jalisco.

The Bolanos M. Co. has been organized in St. Louis, Mo., to operate the Bolanos mines in northern Jalisco. The officers are: W. C. Smith, president; C. W. Simmons, treasurer, with J. B. Izabal of Guadalajara, manager. Work will be started this month.

H. M. Sunde et al. of Mascota propose to build a concentrating mill and a power plant at Agujas mountain, near Mascota. Water power will be obtained from the Tatoani river.

##### Sonora.

The Klondyke mine, near Magdalena, has been unwatered and the mill is run-

ning on free-milling ore. Development work is also progressing.

Tunnels aggregating 6415 feet in length have been completed at Cananea to connect the Veta Grande, Oversight and Capote mines of the Greene Con. C. Co.

The old smelter at Nacozari has completed its work and shut down, and is not expected to resume reduction of copper in that camp. The concentrating mill owned by the Moctezuma C. Co. will be continued and all ore requiring concentration will receive treatment there, the product of the mill being shipped to Douglas, Ariz., and smelted in the furnaces of the Copper Queen. The Nacozari smelters were erected eleven years ago. J. S. Douglas is manager of the mines and reduction works.

The San Blas M. Co., operating a mine near Caborea, in Altar district, will build a mill. The company is proceeding with development work and using a 3-stamp mill for sampling and testing purposes.

J. Henley, manager of the Hays Con. M. & L. Co. at Campo Hays, in the Pinito mountains, 12 miles east of Quijano station, reports operations progressing satisfactorily and the 20-stamp mill crushing pay ore. The company also owns timber and grazing lands in Magdalena district.

J. M. Morrison, manager of the Richfield M. Co., near Ures, says he has men on development work and improvements will be made.

##### Tamaulipas.

The San Carlos C. Co. railroad has only the last 14 kilometers to build from Linares on the Mexican Central to the company's mines and smelter at San Jose. The contractor building the road has 300 men at work. E. D. Self is manager of the mines.

##### Zacatecas.

At Zacatecas the San Rafael el Grande mine will be unwatered. The mine is owned by the Stillwell Co. A. F. Nathan is manager.

Near Jimulco, the Zacatecas M. Co. will put in more machinery at its copper mines.

##### Vera Cruz.

The Oil Fields Co. of Mexico, which has developed a flowing well near Misantla, will build 9 miles of railroad, oil storage tanks of a total capacity of 100,000 barrels, and increase its drilling equipment.

#### TASMANIA.

The Mount Lyell M. & R. Co. at Mount Lyell reports from August 18 to September 14 a total of 30,347 tons of ore treated, being 22,324 tons from the Mount Lyell mine and 8023 tons from the North Mount Lyell mine. In addition, there was treated 489 tons of purchased ore and metal-bearing fluxes. The converters produced during the same period 618 tons of blister copper, containing: Copper, 610 tons; silver, 58,202 ounces; gold, 1760 ounces.

#### Commercial Paragraphs.

THE Redfield Drill Co., Denver, Colo., report the sales of their hand drills to Elgin, Or.; Folsom, Cal.; Jefferson, Colo.; and two of their electric drills to Ouray, Colo.

THE Brown Corliss Engine Co. of Corliss, Wis., have an order from the Jones & Laughlin Steel Co. for one 30 & 60x48-inch tandem compound condensing Corliss engine, to replace another make of engine in their rolling mill plant at Pittsburg, Pa.

THE Englebach Machine Manufacturing Co., Leadville, Colo., have orders for the Englebach sample grinders as follows: Two to Monterey, Mexico; two to Douglas, Ariz.; one to Anaconda Copper Co., Anaconda, Mont. (this company has six of these sample grinders in use); one to Crofton, B. C.; one to Rossland, B. C.

LARSON & GREENOUGH of Mullan, Idaho, have recently installed a Stromberg-Carlson telephone system at their mines, and write the manufacturers as follows: "We installed one of your mine telephones several months since, and wish to say that it has given the best of satisfaction. It is a surprise to us that we ever got along without it."

THE Rand Drill Co. of New York have recently sold through their Denver, Colo., agency—Cary & Fielding—one six-drill compressor to the Butterfly-Terrible mine; one twenty-drill compressor to the Mogul Co. at Silverton, Colo.; one eight-drill compressor to the Sunnyside mine, Eureka, Colo.; one thirty-drill compressor to the Dives-Pelican mine, Georgetown, Colo., all of the Imperial type.

THE Wellman-Seaver-Morgan Company, engineers and manufacturers, with general offices at Cleveland, Ohio, and plants at Cleveland and Akron, Ohio,

announce that on October 1st they opened a New York office, having taken a suite of offices at 42 Broadway. Mr. Geo. B. Damon, who is a well known and able engineer, has been appointed New York manager, and any inquiries addressed to the New York office will have the immediate and personal attention of Mr. Damon.

THE C. O. Bartlett & Snow Co. of Cleveland, O., report the following recent sales: Buckeye Reduction Co., Findlay, O., one Triumph steam dryer; S. Mendelson, Elyria, O., one Triumph steam dryer; Sinns' Stucco Retarder Co., Uhrichsville, O., one Triumph steam dryer; Daniel H. Grandin, Jamestown, N. Y., belt conveyor and other machinery; Ohio Sand Co., Conneaut, O., elevating and conveying machinery; Crown Dryer Co., Cleveland, O., elevating and conveying machinery; I. E. Boomer, Detroit, Mich., one Triumph gravel excavator and digger; Lowe Bros., Detroit, Mich., four special paint machines with motor drives; Morillon G. & C. Co., Cooney, N. M., special grading machinery; Jas. W. Ellsworth & Co., Cleveland, O., coal elevating and conveying machinery.

#### Personal.

W. E. DEFTY of Phoenix, Ariz., is making mine examinations in Montana.

R. S. BAVERSTOCK has returned to Los Angeles, Cal., from eastern Oregon.

H. BANFIELD is manager of the Rainbow mine at Drew, Douglas county, Or.

F. O. COURTMARSH is manager of the Gold Divide drift mine, near Mokelumne Hill, Cal.

H. B. KAEDING has returned to San Francisco, Cal., from mine examinations in Oregon.

W. SAUNTRY is president of the Columbus Con. G. M. Co., operating near Deadwood, S. D.

J. F. ERISMAN is manager of the Blue Flag Mining Co., operating at Cripple Creek, Colo.

C. C. NEPPLE has resigned as superintendent of the New York mine, near Sumpter, Or.

F. W. KUHFIELD is in charge of operations at the South Fork gravel mine at Forest City, Cal.

C. MCCARTHY is superintendent of the Homestake mine at Silver Peak, Esmeralda county, Nev.

T. E. EREHART of Schenectady, N. Y., is manager of the Lucky Boy mine at Trout Lake, B. C.

R. O. JONES, chief engineer Jeanesville Iron Works, has returned to Hazleton, Pa., from California.

G. M. SEELEY is superintendent of the Highland Mary mine near Howardsville, San Juan county, Colo.

J. C. DEVINE is assistant superintendent of the Troy-Manhattan C. Co. at Troy, Pinal county, Ariz.

C. B. GAMMON of Carthage, Mo., is manager of the Opal Wonder M. Co., operating at Webb City, Mo.

G. L. MOATS of Salt Lake City, Utah, manager of the Latham M. Co., has gone East on company business.

N. H. CLARK is manager of the White Knob C. Co., operating at Mackay, Idaho, vice P. L. Fearn, resigned.

P. D. AHIER is manager of the Idaho-Alamo Con. M. Ltd. at Sandon, B. C., vice W. S. Jenkins, resigned.

W. L. AUSTIN is consulting engineer for the White Knob C. Co., operating at Mackay, Custer county, Idaho.

W. F. SNYDER of Salt Lake City, Utah, president of the Western Exploration Co., is in the East on company business.

F. H. TIBBETTS has been appointed assistant in civil engineering at the University of California, Berkeley, Cal.

T. RUSSELL has resigned as superintendent of the Western Fuel Co. collieries at Nanaimo, Vancouver Island, B. C.

W. S. JENKINS has resigned as manager of the Idaho-Alamo Con. M. Ltd. at Sandon, B. C., and will go to Scotland.

G. E. VOORHES, JR., of Santa Barbara, Cal., owner of Las Vegas copper mine at Coyame, Chihuahua, Mex., is at the mine.

J. R. MURRIN is superintendent of the Gold Coin mine in Cracker Creek district, near Sumpter, Or., vice J. Doyle, resigned.

P. L. FEARN has resigned as manager of the White Knob C. Co. at Mackay,

Idaho, and has gone to New York City, N. Y.

DONALD WOODRUM, of San Francisco, Cal., is examining mining properties in eastern Oregon for a Portland, Or., company.

H. M. ROCHE of Pasadena, Cal., is superintendent of the Little Tonopah mine of the Electro-Geodetic M. Co. at Tonopah, Nev.

W. SKYRME has resigned as superintendent of the Moonlight and High Ore mines at Butte, Mont., and will go to California.

J. DOYLE has resigned as superintendent of the Gold Coin mine in Cracker Creek district, near Sumpter, Or., and in Portland, Or.

W. S. THOMAS, formerly assayer at the Gwin mine in Calaveras county, Cal., is assayer for the Jumper Mine Syndicate, Ltd., at Stent, Cal.

A. A. COLE, chemist and assayer of the War Eagle and Center Star mining companies at Rossland, B. C., returned last week from the East.

SUPERINTENDENT CUSICK of the I X L mine, near Sumpter, Or., has also been given charge of the New York mine, vice C. C. Nepple, resigned.

W. N. WILLIAMS is manager of the North Sheba G. & Exp. Co., Ltd., operating in north De Kaap district, near Johannesburg, South Africa.

S. C. HOLMAN, superintendent of the Mother Lode mine, at Deadwood, B. C., returned there last week after a trip to Alaska and to Eastern points.

W. S. BACON, recently with the Ida Mitchell mine, near Placerville, Cal., is superintendent of the Barbara mine, near Gold Hill, in the same section.

J. M. MORRISON of Washington, D. C., manager of the Richfield M. Co., is superintending operations at the company's mines near Ures, Sonora, Mex.

C. A. DOREMUS has resigned as professor of chemistry in the College of the City of New York, to engage in practice as consulting engineer and chemist.

W. E. PROCTOR has resigned as superintendent for the Darien G. M. Co., operating La Mina Espiritu Santo at Cana, Colombia, and will locate at Sutter Creek, Cal.

W. FRITCH of Ishpeming, Mich., has accepted the position of manager of the United States M. Co. at Salt Lake City, Utah. R. S. Holden will continue as managing director.

H. LOWE, who has been assistant superintendent of La Mina Espiritu Santo of the Darien G. M. Co., at Cana, Colombia, is superintendent, vice W. E. Proctor, resigned.

W. J. KEOUGH, formerly superintendent of the Red Roy mine, Baker county, Or., is superintendent of the Mount Baker M. Co.'s property in Mount Baker district, near Whatcom, Wash.

ARTHUR WINSLOW of Boston, Mass., manager of the Liberty Bell mines at Telluride, Colo., and of the Combination mines at Goldfield, Nev., has been examining mines at Nevada City, Cal.

#### Obituary.

H. P. LILLIBRIDGE, principal owner in the Red Umbrella, Mayflower and other Cripple Creek, Colo., mines; died on the 5th inst. at Detroit, Mich. Deceased was formerly interested in the Mollie Gibson and other mines at Aspen, Colo. He was 62 years of age, and was at one time United States Consul-General at Hawaii.

W. F. THOMPSON of Denver, Colo., a pioneer miner and millman of Colorado, died at Denver October 5th. Deceased was born in Westchester county, New York, May, 1838. He crossed the plains in 1861 and spent some time in Black Hawk and vicinity, prospecting and milling. Later he went to Wyoming and engaged in the sawmill and lumber business.

A. B. KNIGHT, a pioneer mining engineer of Montana, died at Butte, Mont., September 27th. For the past year or more deceased was with the Bismarck-Nugget Gulch M. Co., near Sheridan, Mont., as consulting engineer. He was born in Livingston county, New York, February, 1844. He moved to Michigan, where he graduated from the State University at Ann Arbor. He was a Civil War veteran. In 1901 he was professor of mining engineering in the Montana State School of Mines at Butte.

## Latest Market Reports.

SAN FRANCISCO, October 14, 1904.

## METALS.

**SILVER.**—Per oz., Troy: London, 26<sup>3</sup>/<sub>4</sub>d (standard ounce, 925 fine); New York, bar silver, 57<sup>3</sup>/<sub>4</sub>c, refined (1000 fine); San Francisco, 57<sup>3</sup>/<sub>4</sub>c; Mexican dollars, 47c San Francisco, 45<sup>1</sup>/<sub>2</sub>c New York.

**COPPER.**—New York: Standard, \$13.00; Lake, 1 to 3 casks, \$13.25; Electrolytic, 1 to 3 casks, \$13.10; Casting, 1 to 3 casks, \$13.00; San Francisco: \$15.00. Mill copper plates, \$17.00; bars, 18@24c. London: £59 18s 6d spot per ton.

Copper has shown a slightly upward tendency the past two weeks, the 13-cent mark having been passed. Lake now being quoted at \$13.25. This upward movement has been anticipated for some time past. This upward tendency of the copper market is due to heavy buying, particularly in Europe. The constant and growing demand for copper in electrical installations has much to do with the heavy consumption of the metal. In London the price of spot copper is now as high as it was a week ago for the metal on three months delivery. In consideration of the present condition of the market a somewhat higher price may be anticipated.

**LEAD.**—New York, \$4.30; Salt Lake City, \$3.50; St. Louis, \$4.12<sup>1</sup>/<sub>2</sub>; San Francisco, \$4.50, carload lots, 4<sup>1</sup>/<sub>2</sub> 1000 to 4000 lbs.; pipe 6<sup>1</sup>/<sub>2</sub>, sheet 7, bar 5<sup>1</sup>/<sub>2</sub>; pig, \$4.85. London: £12 2s 6d long ton.

**SPELTER.**—New York, \$5.20; St. Louis, \$5.00; London, £22 15s per ton; San Francisco, ton lots, 6<sup>1</sup>/<sub>2</sub>; 100-lb. lots, 7c.

**TIN.**—New York, pig, \$28.00@28.50; San Francisco, ton lots, 29c; 500 lbs., 29<sup>1</sup>/<sub>2</sub>c; 200 lbs., 30c; less, 31c; bar tin, \$32<sup>1</sup>/<sub>2</sub>@35c. London, £129 12s 6d spot.

**PLATINUM.**—San Francisco, crude, \$18.50 per oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75 @ 82c per gram.

**QUICKSILVER.**—New York, \$42.00@44.00, large lots; London, £7 15s San Francisco, local, \$41.50@42.50 per flask of 75 lbs.; Denver, \$45.00. Export, \$41.50@42.50.

**BABBITT METAL.**—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6<sup>1</sup>/<sub>2</sub>c; extra, 17<sup>1</sup>/<sub>2</sub>c; genuine, 31<sup>1</sup>/<sub>2</sub>c; Eclipse, 35c.

**SOLDER.**—Half-and-half, 100-lb. lots, 19c; San Francisco, Plumbers', 100-lb. lots, 16c.

**ZINC.**—Metallic, chemically pure, \$3.10, 50c; dust, \$3.10, 10c; sulphate, \$3.10, .04c.

**NICKEL.**—New York, 40@47c per lb.; ton lots, 40@47c.

**ALUMINUM.**—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 31@34c.

## STRUCTURAL MATERIALS.

**IRON.**—Pittsburg, Bessemer pig, \$12.75 @12.85; gray forge, \$12.00; San Francisco, bar, 3c per lb., 3<sup>1</sup>/<sub>2</sub>c in small quantities.

**STEEL.**—Bessemer billets, Pittsburg, \$23.00@23.00; open hearth billets, \$23.00 @23.00; San Francisco, bar, 7c to 12c per lb.

**WHITE LEAD.**—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6<sup>1</sup>/<sub>2</sub>c; less than 500 lbs., per lb., 7c; in 25-lb. tin pails, 1<sup>1</sup>/<sub>2</sub> c per lb. above keg price; in 1 and 5-lb tin cans, 100 lbs. per case, 4c. per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6<sup>1</sup>/<sub>2</sub>c; do. in kegs, 7c.

**LUMBER.**—(Retail): Pine, ordinary sizes, \$24.00@25.00; extra sizes higher; redwood, \$28.00@30.00; lath, 4 feet, \$4.50 @5.00; pickets, \$21.00; shingles, \$2.50 for No. 1 and \$2.25 for No. 2; shakes, \$13.50 for split and \$15.00 for sawed; rustic, \$28.00 @35.00.

**NAILS.**—This week the basic prices are: Wire, \$2.77; Cut, \$3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, \$3.35; Cut, \$3.55; 10d to 16d, Wire, \$3.45; Cut, \$3.35; 8d Wire, \$3.50; Cut, \$3.50; 6d and 7d, Wire, \$3.60; Cut, \$3.60; 4 and 5d, Wire, \$3.70; Cut, \$3.70; 3d, Wire, \$3.85; Cut, \$3.85; 2d, Wire, \$4.10; Cut, \$4.10. Special rates for carload lots.

**LIME.**—Santa Cruz, \$1.25 country, \$1.25 city per bbl.

**CEMENT.**—Imported, \$2.15@2.65 per bbl.; California carload lots, \$2.10 f. o. b. at works; small lots, \$2.40 per bbl. in sacks, 4 sacks to bbl., 10c for each sack returned.

## GENERAL SUPPLIES.

**ANTIMONY.**—New York, Cookson's, 7c; Hallett's, 6<sup>1</sup>/<sub>2</sub>c; San Francisco, 1000-lb. lots, 8c; 300@500-lb., 8<sup>1</sup>/<sub>2</sub>c; 100-lb. lots, 10<sup>1</sup>/<sub>2</sub>c.

**POWDER.**—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15<sup>1</sup>/<sub>2</sub>c; less than one ton, 17<sup>1</sup>/<sub>2</sub>c. No. 1<sup>1</sup>/<sub>2</sub>, 60%, carload lots, 13<sup>1</sup>/<sub>2</sub>c; less than one ton, 15<sup>1</sup>/<sub>2</sub>c. No. 1<sup>1</sup>/<sub>2</sub>\* 50%, carload lots, 11<sup>1</sup>/<sub>2</sub>c; less than one ton, 13<sup>1</sup>/<sub>2</sub>c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9<sup>1</sup>/<sub>2</sub>c; less than one ton, 11<sup>1</sup>/<sub>2</sub>c. No. 2\* 30%, carload lots, 9c; less

than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2.00 per keg.

**CAPS.**—3x, \$5.50@6 per 1000; 4x, \$6.50 @7; 5x, \$8@8.50; Lion, \$9@9.50, in lots not less than 1000.

**FUSE.**—Triple tape, \$4.00 per 1000 feet; double tape, \$3.50; single tape, \$3.10; Hemp, \$2.75; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

**CANDLES.**—Granite 6s, 16 oz., 40s., 11<sup>1</sup>/<sub>2</sub>c per set; 14 oz., 40s., 10c.

**CHEMICALS.**—Cyanide of potassium, 98%-99%, jobbing, 23@24c per lb.; carloads, 23@23<sup>1</sup>/<sub>2</sub>c; in tins, 30c; soda ash, \$2.00 per 100 lbs.; hyposulphite of soda, 3@3<sup>1</sup>/<sub>2</sub>c per lb.; caustic soda, in drums, 3@3<sup>1</sup>/<sub>2</sub>c per lb.; Cal. s. soda, bbls., \$1.20@1.40 per 100 lbs.; sks., \$1.05; chlorate of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2<sup>1</sup>/<sub>2</sub>@2<sup>3</sup>/<sub>4</sub>c; powdered sulphur, 2@3c; flour sulphur, French, 3<sup>1</sup>/<sub>2</sub>@3<sup>3</sup>/<sub>4</sub>c; alum, \$2.00@2.25; California refined, 1<sup>1</sup>/<sub>2</sub>@2c; sulphide of iron, 8c per lb.; copper sulphate, 5<sup>1</sup>/<sub>2</sub>@5<sup>3</sup>/<sub>4</sub>c; chloride of lime, spot, \$2.50@2.75; sulphuric acid, in carboys, 66% B, 1<sup>1</sup>/<sub>2</sub>@2c per lb.; nitric acid, carboys, 8c per lb.

**OILS.**—Linseed, boiled, bbl, 53c; cs., 58c; raw, bbl, 51c; cs., 56c; Lucol oil boiled, bbl, 50c; cs., 55c; raw, bbl, 48c; cs., 53c. Kerosene—Pearl, per gal., 19<sup>1</sup>/<sub>2</sub>c; Astral, 19<sup>1</sup>/<sub>2</sub>c; Star, 19<sup>1</sup>/<sub>2</sub>c; Extra Star, 24c; Eocene, 23c; Elaine, 26c; Water White, in bulk, 13c; Mineral Seal, iron bbls., 18c; wooden bbls., 20<sup>1</sup>/<sub>2</sub>c; cs., 24c; Mineral Sperm, cs., 26<sup>1</sup>/<sub>2</sub>c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22<sup>1</sup>/<sub>2</sub>c; 86" Gasoline, bulk, 25c; do., cs., 31c; 83" Naphtha or Benzine, deodorized, in bulk, per gal., 13c; do., in cs., 19<sup>1</sup>/<sub>2</sub>c; Lard Oil, E. W. S., bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Sperm, crude, 63@68c; Natural White, 63c; Bleached, do., 57c; Whale Oil, cs., 52@57c.

**ALUMINUM.**—No. 1, 99%, small lots, 37c per lb.; 100 lbs., 35c; 1000 lbs., 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

**BORAX.**—Concentrated, 6@7c per lb.; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

**BONE ASH.**—Extra No. 1, 5@6c per lb., No. 1, 4@5c.

**RED LEAD.**—500 lbs. and over at one purchase, \$3.10, 7c; less than 500 lbs., 7<sup>1</sup>/<sub>2</sub>c.

**LITHARGE.**—Pure, in 25-lb. bags, 8@9c per lb.

**MOLYBDENUM.**—Best, \$2.75 per lb.

**CHROMIUM.**—90% and over, \$3.10, 80c.

**PHOSPHORUS.**—American, \$3.10, 70c.

**SILVER.**—Chloride, \$3.10, 90c@91.00; nitrate, 55c.

**MERCURY.**—Bichloride, \$3.10, 77c.

**MAGNESIUM.**—Pure, N. Y., 60c.

**MANGANESE.**—\$3.10, 75c.

**SODIUM.**—Metal, \$3.10, 50c.

**BISMUTH.**—Subnitrate, \$3.10, \$2.10.

**URANIUM.**—Oxide, \$3.10, \$3.50.

**FIRE BRICK.**—Domestic, carloads per 1000, f. o. b., factory square, \$25.00; soap and split, \$22.50; arch and wedge, \$27.50; skewback, \$30.00; circle, \$32.00.

**FIRE CLAY.**—Domestic, per ton 2000 lbs. in 125-lb. bags, double, and dry ground, f. o. b., factory, \$8.50.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

\*\*\*\*\*

## Books Received.

\*\*\*\*\*

Under title of "Mineral Resources of the United States for 1904," the United States Geological Survey has issued:

"Production of Copper;" "Production of Zinc."

"Report of the United States Naval 'Liquid Fuel' Board" on tests of relative efficiencies of coal and oil as fuels under forced and natural draft has been issued by the Bureau of Steam Engineering, Navy Department, Washington, D. C.

Among recent publications of the United States Geological Survey received, are professional paper No. 24, "The Zinc and Lead Deposits of Northern Arkansas," by G. L. Adams, A. H. Purdie and E. F. Burchard; professional paper No. 25, "Copper Deposits of the Encampment District of Wyoming," by A. C. Spencer; professional paper No. 26, "Economic Resources of the Black Hills," by J. D. Irving, S. F. Emmons and T. A. Jaggar, Jr.

This paper is one of the most complete descriptive works on ore occurrence in this important mining region; professional paper No. 27, "A Geological Reconnaissance Across the Bitter Root Range and Clearwater Mountains in Montana and Idaho," by W. Lindgren; bulletin No. 232, "A Gazetteer of Virginia," bulletin No. 233, "A Gazetteer of West Virginia," bulletin No. 241, "Experiments in Schistosity and Slaty Cleavage," by G. F. Becker.

## Trade Treatises.

The Chapman Valve Manufacturing Co., Indian Orchard, Mass., send a sumptuous setting-forth of their makes of valves and giving a classified list of their recent customers.

A CATALOGUE from the Cyclone Drilling Machine Co., Orrville, O., illustrates and describes their drilling machinery for coal, water, oil, gas and placer mining. They furnish complete outfits for prospecting and proving ground for gold dredge mining, etc. They will supply on request a special catalogue on any one of the following: Coal prospecting, contractors' drills, water well drills, oil and gas well drills, placer mining drills.

Catalogue No. 2 from the Vulcan Iron Works, San Francisco, Cal., of standard size (6x9 in.) and typographically excellent, is devoted to ice-making plants (can or plate system), and refrigerating machinery in general, comprising both the direct and brine system. Ammonia fittings and valves, condensers, return bends, etc., are illustrated and described in detail. The Vulcan Iron Works build insulated cold storage rooms of any size, insulated with mineral wool or sheet cork. They manufacture the Vulcan cold storage room doors, specially designed to insure an air-tight joint, and provided with bevel jamba rubber packed, and with heavy hinges and clamping handles. They carry mineral wool in stock for immediate shipment.

## New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR WEEK ENDING OCTOBER 4, 1904.

771,760.—TREATING SEAWEED—D. M. Balch, Colorado, Cal.  
771,596.—POWER WHEEL—A. C. Bates, Oakland, Cal.  
771,452.—BURIAL APPARATUS—J. H. Beattie, Tacoma, Wash.  
771,526.—MOTOR—W. Blackburn, S. F.  
771,412.—CREMATING FURNACE—Brett & Benton, Los Angeles, Cal.  
771,711.—LUBRICATOR—E. Clark, Winslow, Ariz.  
771,703.—SPRING MACHINE—C. A. Connan, Los Angeles, Cal.  
771,623.—KILN—D. H. Gibson, Seattle, Wash.  
771,797.—STEAM BOILER—Heberer & Hyne, Alameda, Cal.  
771,730.—CUFF—W. F. Howell, S. F.  
771,475.—ELEVATOR—J. J. Jordan, Tonopah, Nev.  
771,455.—HAND STAMP—S. W. Metcalf, Sisson, Cal.  
771,742.—CALENDAR—T. O'Shaughnessy, San Jose, Cal.  
771,495.—BARREL BUSHING—F. M. Pfleger, Portland, Or.  
771,268.—ARTIFICIAL LIMB JOINT—G. Reinhardt, Elmhurst, Cal.  
771,555.—CAR BRAKE—E. Stevens, Monroe, Wash.  
771,296.—BURIAL ALARM—G. A. F. Streuber, Seattle, Wash.  
771,792.—HYDRAULIC FLUME—G. W. Wilderman, Portland, Or.

## DELINQUENT SALE NOTICE.

**ORLEANS CONSOLIDATED MINING COMPANY.** Location of principal place of business, San Francisco, California; location of works, Grass Valley, Nevada County, California.

Notice—There are delinquent upon the following described stock on account of assessment (No. 2) levied on the 6th day of August, 1904, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	Shares.	Amt. 1904.
Geo. P. Thurston, Trustee.....	232	1000	\$75 00
J. C. Diamond.....	474	50	3 75
J. C. Diamond.....	475	53	3 97 <sup>1</sup> / <sub>2</sub>
D. F. Bell.....	206	76	5 70
J. F. Lang.....	209	15	1 12 <sup>1</sup> / <sub>2</sub>
John Jose.....	219	2 <sup>1</sup> / <sub>2</sub>	19

And in accordance with law and an order from the Board of Directors, made on the 6th day of August, 1904, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the company at San Francisco, California, on MONDAY, the 31st day of October, 1904, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

W. H. SMITH, Secretary.  
Office—Room 10, No. 324 Pine street, San Francisco, California.

**SAN FRANCISCO ARTIFICIAL LIMB CO.**  
MENZO SPRING.

[Established in San Francisco 1871.]

**BEST IMPROVED ARTIFICIAL LIMBS**  
Manufactured and Office Moved to  
738 Mission St., San Francisco, Cal. (Room 407).  
Measurement Blanks for Self-Measurement Free.

Artificial Limbs Repaired with skill and dispatch. Correspondence by U. S. to furnish Limbs on Government orders.

**THE CALIFORNIA DEBRIS COMMISSION**  
having received application to mine by hydraulic process from N. H. Burger, in Dry Gulch Gravel Mine, near Pleasant Valley, El Dorado County, Cal., draining into Clear Creek which reaches Cosumnes River, gives notice that a meeting to receive any protests will be held at Room 96 Flood Building, San Francisco, Cal., Oct. 31, 1904, at 1:30 P. M.

**THE CALIFORNIA DEBRIS COMMISSION**  
having received application to mine by hydraulic process from E. J. Gordon and P. McElroy, in Messer Mine, near Mountain House, Plumas County, Cal., draining into Spanish Creek, which reaches Feather River, gives notice that a meeting to receive any protests will be held at Room 96 Flood Building, San Francisco, Cal., Oct. 17, 1904, at 1:30 P. M.

LET US PUT IT BEFORE YOU PLAINLY.

Say the cost of oil at your plant is \$300 per annum. If you used a

## CROSS OIL FILTER

you would SAVE THE COST OF OIL.

at \$150, which is the interest at 6% on \$2500. Don't you think it worth while to order a Cross Oil Filter to-day? Sent anywhere on thirty days' approval.

"So far as we are aware, the Cross Oil Filter is the most satisfactory filter on the market."—St. Louis (Mo.) Portland Cement Co.

**THE BURT MFG. CO.,**  
Largest Mfrs. Oil Filters in the World,

Supplied also by Oil Companies, Engine Builders and Power Contractors.

## SITUATIONS WANTED.

## A FOREMANSHIP OR SUPERINTENDENCY.

Twelve years' experience, practical mining. Possesses technical knowledge necessary for economical ore extraction. Address Edward W. Ralph, 602 W. Broadway, Butte, Montana.

**CYANIDE CHEMIST DESIRES POSITION AS**  
Cyanide Superintendent; 8 years' experience; understands milling; good assayer; best of references. Address "Cyanide," Box 1822, Denver, Colo.

**EXPERT MINE FOREMAN WANTS POSITION.**  
Competent to handle arduous difficult conditions underground. Address "Limestone," Room 602, 830 Market St., S. F.

**MINE SUPERINTENDENT WANTS POSITION.**  
Capable miner, mill man, cyanide man and assayer. Address R. F., this office.

**MINING COMPANIES AND MINING ENGINEERS**  
installing steel cyanide tanks and desiring a first-class boiler maker familiar with class of work to do the erecting and riveting for them, address Box 25, this office. Best of references.

**MINING ENGINEER, GRADUATE MASS.**  
Institute of Technology, 1885, with wide mining experience, also electrical training; over two years with one of our largest electrical companies; speaks Spanish; can handle labor, and will go anywhere; is open to engagement. Address Robert Shea, Exposition Headquarters, American Institute of Mining Engineers, Block 74, Mines Building, St. Louis.

**PRACTICAL PROSPECTOR AND PROSPECT EXAMINER.** Have your work done by me and you will know where and when to invest your money. Address A. J. Davis, Pine Flat, Sonoma Co., Cal.

**POSITION DESIRED BY AN ELECTRICAL**  
and Gas Engineer; technical graduate; three years' experience in electrical work, eight years' experience in the operation of gas engines; will accept position in either line, but prefer to combine the two. Address R. W. Shoemaker, 613 E. Sixth St., Los Angeles, Cal.

**WANTED—POSITION AS SUPERINTENDENT**  
or assistant supt by a practical man; first-class chemist and assayer. Specialty: Reduction work, milling and smelting. Address X, this office.

**WANTED—POSITION BY EXPERIENCED**  
Mining Stenographer, Bookkeeper and Assayer, with reliable mining company. Address A. R. Wistrand, Wrangell, Alaska.

**THE ENGINEERING AGENCY, CHICAGO,**  
furnishes free to reliable employers information leading to employment of Mining Engineers, Draftsmen, Mine or Mill Superintendents, Assayers, Chemists, Cyanide Men, Electricians, etc. In successful operation eleven years. Let us know your need and competent, high-grade men whose complete professional and personal records have been thoroughly investigated will be referred to you at once.

## HELP WANTED.

**COMPETENT APPLICANTS FOR ANY ENGINEERING**  
positions furnished to employers without charge. Experienced men wanting such positions should write for terms. Cleveland Engineering Agency, Rose Building, Cleveland, O.

## ASSESSMENT NOTICES.

**GOLDEN WEST MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 17th day of September, 1904, an assessment (No. 2) of one (1) cent per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 207 Battery street, Room 15, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of October, 1904, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 28th day of November, 1904, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
CHAS. BOVONE, Secretary.  
Office—207 Battery street, Room 15, San Francisco, California.

FOR USE IN  
**SMOKE or  
GAS** in  
**MINES.**

**PERFECT  
PROTECTION**

afforded only by the

**VAJEN HEAD PROTECTOR.**

**VAJEN-BADER CO.  
RICHMOND, IND.**

Two  
Styles:  
**STAR**  
and **U.S.**  
Made in  
Brass  
Also. ★

**STAR PATTERN** for Heavy Pressure.  
**U. S. PATTERN** for Ordinary Pressure.

We warrant them for all service where a quick, reliable action is required. It will pay you to investigate. Full particulars from any jobbing supply house, or direct from the manufacturers.

**The Wm. Powell Co., Cincinnati, O.**  
Manufacturers.

**LUNKENHEIMER  
SIGHT FEED LUBRICATORS  
AND OILING DEVICES**

We are not only leaders but headquarters for Lubricating Appliances. Our line is the most complete made and warranted to satisfy. If you want the satisfying kind specify Lunkenheimer; order from your dealer. Write for catalog.

**THE LUNKENHEIMER COMPANY, CINCINNATI, O., U. S. A.**

## The Putman Boots

Embody everything that is practical in Sportsmen's Footwear. For nearly a quarter of a century Putman Boots have been the standard among Western Hunters, Trappers, Prospectors, Ranchmen and Engineers (who demand the very best) and we have learned through our personal contact with them how to make a perfect boot. Putman Boots are water proof. Send for catalogue of over 20 different styles of boots. Also Indian Tanned Moose Hide Moccasins.

This cut shows our No. 678 Three Quarter Boot, (14 inches high) Bellows Tongue. Made on any style toe desired. Uppers are Special Chrome Tanned Calf Skin, tanned with the grain of the hide left on (our special tanning) making the leather **Water Proof**. Large eyelets and wide leather laces, also laced at side to fit the boot tight around the top. Furnished in Black, Brown or Straw Color. Sole, Light, Medium or Heavy. The sole is genuine Hand Sewed (making it soft and easy), and made of the best Water Proofed Oak Sole Leather. Made to your measure and delivered to any part of the U. S. for \$7.50. Send for order blank showing how to measure your foot.

**H. J. PUTMAN & CO.**

23 BRIDGE SQUARE, MINNEAPOLIS, MINN.

## Hurry-up Jobs

need the "Triplex." It's fast in lifting and lowering, and saves half the work.

Besides, one man can make repairs or swing a heavy load without calling for help.

Made with any length of hoist.

Ask your dealer.

**Yale & Towne, New York.**

## CARY SPRING WORKS,

240 & 242 WEST 29th STREET, NEW YORK, U. S. A.

Telephone, 3346-38th St.

**WIRE  
SPRINGS**  
OF EVERY DESCRIPTION.

Manufacturers of  
All kinds of **ROUND and FLAT WIRE,**

## Greater Economy.

In these days of rapid progress in every branch of industry, the one object is to reduce production cost while maintaining or increasing output. It applies to no industry more directly or completely than to mining and metallurgy. Economy of production is sought in the introduction of labor-saving machinery, in the making of valuable by-products of what was previously waste material and thrown away as such. Some reduction works have found it profitable to utilize the waste sulphurous gases of their furnaces in the manufacture of acid. Among these may be mentioned the Broken Hill Co. of New South Wales and the Mountain Copper Co. at Keswick, Cal. The magnetic separator is saving the values of complex ores previously thrown out on the waste dump. Wherever it is possible to gain advantage by increasing capacity this is being done, and usually without material increase in the working force. This is being largely accomplished by labor-saving machines in every department. Machine drills cut the holes for blasting; machines load the broken ores, rock and coal into cars, and mechanical haulage of some description

The Mazeppa Mine, Mother Lode, Tuolumne County, Cal. (See Page 271).

Melones Flume, Cal., Capacity 6000 Inches. (See Page 272).

transports the material to the shaft or to the surface. If to the shaft, it is dumped automatically, hoisted, and dumped again automatically, and here it goes through the various processes of treatment, by gravity or power, all without human interference, until the finished product is secured. The separation of mine and reduction works by a few feet or several miles is no longer a matter for serious contemplation.

If it be a short distance, a belt conveyor or a short tram line does the business. If a long distance, an electric railroad or an aerial tramway fills the requirement.

Although it sometimes seems as though the limit had been reached, the appearance of some new device to

more quickly and cheaply accomplish that which we had considered only possible by the means of hands, shows that the end has not been reached and that there really is something new under the sun.

## Cost of Dredging.

The matter of the cost of recovering gold by dredging is being investigated by numerous engineers and others with a view to possible investment. It is evident upon a moment's reflection that this must fluctuate considerably with the varying conditions found in the many dredging fields. One important factor is the size and capacity of the dredge, and another is the character of the material to be dredged. In addition to these there are numerous other important considerations, among which are the character of the bedrock and the depth of the deposit. Power, too, is not always obtainable at the

same rate per horse power. It is expected, as a matter of course, that a large dredge will operate more cheaply than a smaller one, as its assumed greater capacity will reduce working costs per yard of material treated, but it goes without saying that a smaller machine working under favorable conditions may be operated as cheaply as a larger one where the conditions of operation are difficult, with a consequent loss in capacity. The report of the Oroville, Cal., Gold Dredging and Exploration Co. for 1903 showed that 474,610 cubic yards of gravel were dredged and washed at an average cost of \$0.0648 per cubic yard. As the material dredged was soil, loose gravel and sand, it may be assumed that a dredge operating on coarser material would be unable to show as low a cost sheet.

IN concentrating the object is always to eliminate the worthless (usually the lighter) material from the more valuable and heavier. In mills this is effected on various types of tables, belt machines and jigs, all having some sort of mechanical movement. Water is also employed in each of these various types of machines. Thus far, however, no machine has been introduced which makes a complete separation of the various kinds of sulphides—lead, zinc, iron and copper—one from the other, although many of the mechanical devices employed make a remarkably clean separation of the sulphides from the gangue. By the use of the electro-magnetic separator zinc can generally be separated from its associated sulphides, but the iron, copper and lead still continue to be collected together. Experimenters are working on this problem and it is not unlikely considerable advancement will be made in this direction.

THE present condition of the copper industry and its prospects for the future are promising. The price has steadily advanced for several weeks past—in small fractions, it is true, but it has been an advance, nevertheless, and a healthy one, based evidently on the relative production and consumption. A large amount of the metal has been shipped to Europe, but the home demand is strong, and under this condition the price continues to advance. The copper output of foreign producers is not as heavy as formerly in some instances, and the supplies in foreign countries are getting lower, particularly in Japan. A large amount of copper is used in England annually in the manufacture of copper sulphate, and the statement is made that during the next six

months at least 15,000 tons will be required there for this purpose alone. Those who are familiar with the copper stocks on hand and production of the various nations predict a still higher price for the metal. The total stock on hand early the present month was only about 7500 tons, a gain of only 2000 tons since January 1st last.

## Mount Morgan Report.

The annual report of the Mount Morgan gold mine of Queensland, Australia, for the year ending June 1, 1904, shows some interesting facts in connection with the extensive mining operations carried on there. The output of the mine comprises several classes of ore—the straight gold ore, both oxidized and sulphide; a copper-gold ore, and an ore treated for sulphur or its products. In the open cut there was mined 118,139 tons of oxidized ore and 123,599 tons of waste rock. The overburden removed amounted to 305,625 tons. Underground there was mined 416 tons of oxidized ore, 117,523 tons of sulphide gold ore, 3466 tons of copper-gold ore—a comparatively recent production at this mine—and of the "sulphur" ore 1147 tons were produced. There was also mined 153 tons of limestone for flux in the furnaces. Waste rock was mined underground to the amount of 16,702 tons, making a total of 240,691 tons of ore. The waste handled made a total of 445,926 tons, or nearly twice as much as all the ore treated. A great part of the surface waste—overburden—was removed by means of steam shovels.

The company has carried on vigorous deep prospecting by means of diamond drills. The introduction of steam shovels into the mining operations at Mount Morgan is pronounced by the management a success, and the intention is to add another shovel of still larger capacity, the bucket having a capacity of lifting ten tons at each load. The development of the copper-gold zone has gone on satisfactorily during the year, and the amount of ore now determined by diamond drill bore holes is estimated at over 500,000 tons.

The Mount Morgan is one of the largest mining concerns in Australia. Extensions of plant and innovations in ore treatment have been of frequent occurrence there and are watched with interest by mine managers everywhere. Old ore piles are leached for copper and the cement metal produced is 77% pure copper. The water used in leaching, after passing to the precipitation boxes, is pumped back for sluicing out the leaching tanks. In almost every department improvements are being made in operating methods, with a reduction of costs. At present the company is experimenting with the gold-copper ores with a view to their less expensive reduction.

THE revival of an old mining camp at Reveille, Nye Co., Nev., is an instance of the energy with which the mining industry is being urged in that State. Reveille was an old and practically abandoned camp thirty years ago. During its early days in the latter sixties it was a shipper of high-grade ores, but the rich spots were not numerous enough for the times and gradually mining in that district came to a standstill. Now, however, with a railroad at Tonopah, only 50 miles away to the westward, new conditions have developed for Reveille district just as they have for many other districts, both old and new, in Nevada and Utah. The veins of the district are large and well mineralized, and the probability is that some of the new undertakings will become profitable and long continued producers, while some of the old ones will share in a measure this revival of prosperity. The camp is only another illustration of how time and changing conditions make the unsuccessful and poverty stricken camp of to-day the rich and prosperous one of to-morrow.

IN the Lake Superior region, somewhat of an innovation is being undertaken in employing compressed air to run the heavy stamps of the "Ball" type instead of steam. The power is to be generated by electricity, which will be transmitted some distance to the compressors. There seems no good reason why the air should not work under proper conditions as satisfactorily as steam. Experiments have been in progress for some time past in this direction, and now the idea will be put to practical test at the Victoria mine in Ontonagon county, Mich.

## The Barometer in Mining.

Some time since W. Lindgren of the United States Geological Survey, while engaged in the resurvey of the Cripple Creek district, found that the atmospheric conditions, as indicated by the readings of an aneroid barometer, had a direct influence upon the conditions of the air underground in mine workings. The normal barometric reading at 10,000 feet, which is approximately the elevation of Cripple Creek, is 20.48 inches. When the barometer indicates a lighter pressure than the normal at any of the mines it is found that the heavy carbon dioxide settles in the workings and is moved less readily by the ventilating fans, or other means of ventilation. At the Anchoria-Leland mine a barometer is daily consulted to note any material change in atmospheric pressure. When the night shift leaves the mine there are no workmen underground for several hours. It is the duty of the watchman to note the barometric reading, and if it is lower than the normal he turns steam into the workings at intervals, which has the effect of absorbing the carbon dioxide, and the atmosphere underground is purified.

There are many mines in Cripple Creek in which the air is so bad at times as to seriously interfere with work. At the Anchoria-Leland there has been much loss of time due to bad air. At one time when driving a level the gas entered the mine from fissures in the rocks as to render further work for the time being impossible. The expedient of lining the drift with tin was tried, but this afforded only temporary relief. Since the introduction of the barometer and the blowing of live steam into the workings at such time as is indicated by low readings of the barometer, the conditions have materially changed for the better. Doubtless there are many places where this ingenious method of watching the air circulation of underground workings may be adopted with equally satisfactory results.

THE "dry season" in some of the mining counties of California has been short this year, not owing to extra vigilance of the water companies, or to more progressive improvements in impounding larger amounts of water, but to a greater amount of rain during the spring months and heavy early fall rains and snow in the mountains. For many years past the mining industry has suffered from a shortage of water, but little effort has been made to remedy the conditions further than to install electric plants for distribution of power, which has enabled some mines to dispense with water power. Very few mines now own water power plants, and still fewer own electric plants, consequently the greater number depend wholly on the companies owning water and large distributing electric plants, for both power and water, without either of which the mines cannot be operated. Generally large companies own both water and electric plants, and a shortage of water results in cutting off the water supply at the mills, though usually power can be supplied, but power without water in a stamp mill is useless. It would seem that the past years of experience would suggest the necessity and good business policy of enlarging the reservoirs, or otherwise conserving an amount of water to meet the needs of a dry summer, but as yet the matter has not received the serious attention which it justly deserves by the owners of the large water systems which supply the mines with water and power.

THE search for valuable mines is not always promptly rewarded by the discovery of that for which search is so earnestly being made. The Pittsburg Steel Company have been engaged for more than a year in prospecting with diamond drill and otherwise for iron ore in the Baraboo range in northern Wisconsin. Until recently their efforts were fruitless. Now they are developing a rich deposit of iron ore found by means of a diamond drill. This illustrates the need of perseverance under certain circumstances. The engineers were satisfied that the geological conditions were favorable to the occurrence of ore, if only they could find the locality. By persistent effort they have discovered a valuable deposit. Had they discontinued drilling operations, the entire vicinity would probably have been abandoned as an unpromising field in which no iron was likely to be found.

## CONCENTRATES.

FROM the description, the bucking of the trolley car is probably caused by moisture on the car commutator.

THE electric conductivity of wires of the same substance is inversely as their lengths and directly as their sections.

"NATIVE" nickel, or nickel in a free state, is as rare as platinum in place. It is usually found combined with sulphur, iron, arsenic or cobalt.

THREE PARTS of firebrick, crushed to 8-mesh, added to one part of fireclay makes a quick-drying cement for furnace muffles that will not crack or scale.

NO COPIES of this journal prior to 1865 can hereafter be supplied. With some exceptions, a copy of any issue since February 18, 1865, can still be furnished.

ASPHALT is considered to be superior to bituminous rock for street paving. It costs considerably more at the start, but, properly mixed and laid, is durable.

TO BEND a small brass pipe without causing it to kink or break, stop one end with a cork or other object and fill the pipe with sand, then closing the other end the pipe may be bent slowly without breaking or kinking.

OIL TANKS should be provided with tap holes in or near the bottom for the purpose of drawing off the water and washing out the sand which always accumulates in them. The oil is taken out at a point above the water line.

ONE-SIXTEENTH OF AN INCH of scale on the inside of a boiler necessitates the burning of 12% more fuel to generate the same amount of steam; one-fourth of an inch requires 38% more fuel; three-fourths of an inch causes a 90% loss of fuel.

WALLS, ARCHES, ETC., when built of concrete can usually be constructed much more quickly and cheaply than if made of brick or masonry, and if the concrete be properly made and of the best materials are as enduring as either brick or masonry.

THE mineral used as the main supply for manufacture of arsenic compounds is arseno-pyrite ( $\text{FeAsS}$ ) or "mispickel." Arsenic compounds are used principally as vermicides, particularly arsenious oxide ( $\text{As}_2\text{O}_3$ ), in preparation of paris green.

BETWEEN parallel conductors, one of which carries a current, an opposing current is induced upon approach, and a current similarly directed upon withdrawal from the first conductor. When a conductor is moved near a magnet, the induced current depends upon the manner of cutting the magnetic curves.

CANADA annually imports about \$1,500,000 of mining and smelting machinery. About half this amount is from the United States. "Concentrates" has been unable to ascertain the exact percentage on which duty is paid, but it is believed about 10% is dutiable, the remainder being free of import duties.

IT is extremely unsafe to go with an open light, such as a candle, into a tank which has been previously used as a receptacle of crude petroleum, but from which the oil has been removed, as explosive gas is almost certain to be present, and an explosion will probably result. Such tanks should be inspected or repaired in the day time, or by means of either electric light or a miner's safety lamp.

AN acetylene lamp will burn in a mine in the presence of foul air when a candle cannot even be lighted, but such experiments are dangerous, as the miner has little warning of the treacherous conditions about him, which are so plainly evidenced by the blue flame and final extinguishing of the caudle. When the air is so bad that a candle cannot be coaxed to burn it is time for the miner to leave.

SKIPS are used for bailing, and hoisting rock as well, generally throughout California, to some extent in Colorado, and almost universally in the Rand in South Africa. Many mines in Montana and in the Lake Superior region are substituting skips for cages. In the issues of the MINING AND SCIENTIFIC PRESS of April 25 and May 2, 1903, is an article dealing in detail with the problem of hoisting water with skips.

THE life of mine timbers depends upon the kind of timber and its condition when placed in the mine; on the condition of the air in the mine. Timber lasts longer in a pure atmosphere than in one reeking with foul gases, moisture and heat. Much depends upon whether the timber will be constantly soaked with water or only partly so, or whether alternately wet and dry. If constantly wet they will not rot; if alternately wet and dry, decay results quickly. The cost of timbering varies with conditions, location and methods employed. In some

large mines the cost of timbering does not exceed 20 cents per ton. In others it is over 50 cents. This is something that cannot be answered without full knowledge of the situation viewed from every point.

TRANSFORMER OIL should contain neither water nor acid. To test the presence of water take a few crystals of copper sulphate (bluestone), drive off the water of crystallization by roasting. To the white powder that is left, add a small quantity of the oil to be tested. If there is water in the oil, the powder will again turn blue. Acid in the oil can be detected by blue litmus paper, which, when touched with acid, turns red.

A DRY BLOWING MACHINE, suitable for treating dry placer sands, can be built at small expense. There are a variety of types of this sort of machine, but all depend upon a shaking motion, and the intermittent puffs of a bellows for their operation. The machine can be built of wood provided with perforated iron screens, canvas aprons and canvas or leather bellows. The movement is usually derived from the operation of an eccentric, actuated by a hand wheel. They are only applicable to dry, light soil or gravel, such as is found in the desert regions.

WHEN roasting iron sulphide to test for gold by panning it is not necessary to use salt. The chemical effect of salt in roasting is to cause the chlorine gas freed by decomposition of the salt to unite with the fine particles of gold, and more or less loss of gold always results from volatilization. A plain roast is all that is necessary, followed by grinding preferably under water. If no gold results that can be seen in panning it is advisable to have the rock assayed in order that it may be detected if present, as gold-bearing sulphides do not always yield gold upon panning.

LIME is used in the cyanide process to neutralize acidity of the ore, and in slimes treatment also to flocculate the slimes and cause the solution to clarify. The amount of lime to be added must be predetermined, as too little is ineffective and too much interferes with the subsequent precipitation of gold in the zinc boxes. It is claimed by James, in his "Cyanide Practice," that at some mills on the Rand in South Africa the addition of lime to the battery facilitates amalgamation and in some instances has increased the saving of gold on the plates to such an extent as to render the slimes too low grade to pay for treatment.

THE function of a tightening pulley is to increase the tension upon a loose belt. It also increases the arc of contact on both driving and driven pulley. The tension upon a belt should be no greater at any time than that which will keep the belt from slipping. When the tension is greater than this the belt wears rapidly. With high-speed belts it is necessary that the tightening pulley be kept in its proper position. When the tension on a belt is removed by withdrawing the tightening pulley the driven pulley will come to a standstill. The belt should then be removed from the driving pulley, or damage will result to the belt from friction.

THERE is nothing of value in the instruments known as the "dowsing rod," "divining rod" and other names given to the more or less elaborate forked devices for finding ore, which depend for their success upon the intervention of some person, but instruments of electrical design have been made, and are said to be in successful use as an aid to locating certain ore deposits which consist of large amounts of mineral like iron, copper, lead, zinc, etc., but these instruments, as far as known, have not as yet been successfully utilized in locating quartz veins, either large or small, which do not contain a high percentage of the sulphides or oxides of the base metals.

THE main source of antimony obtained in the United States is in "hard lead," a by-product in smelting and refining lead-silver ores. Due chiefly to the removal of the import tax on crude antimony in April, 1902, there has been no commercial production of the metal from domestic antimony ores since 1901. Antimony is used chiefly in the manufacture of alloys with lead, tin, zinc, et al.—for type metal, pewter, britannia metal, babbitt and anti-friction metal. The red pigment used in vulcanizing and coloring rubber is antimony penta sulphide ( $\text{Sb}_2\text{S}_5$ ). Tartar emetic, an antimony-potassium tartrate, is used in medicine and as a mordant in dyeing vegetable fiber.

ANDESITE is a volcanic rock containing plagioclase feldspars, hornblende and pyroxene. It was first studied in the Andes mountains, South America, whence the name. Andesine is an essential constituent of andesite and is a lime-soda feldspar. In composition, it is between oligoclase and labradorite. Andesite has a limited amount of glass base, with a ground mass of minute crystals of plagioclase, hornblende, biotite and augite, sometimes rhombic pyroxene (eustatite or hypersthene). Quartz is sometimes present, and, if as phenocrysts (crystals visible without being magnified), the rock is called dacite. Usually phenocrysts of andesite are of plagioclase (andesine) and any or all of the other constituents mentioned.

LARGE working shafts are located in various positions with reference to the strike and dip of the rocks through which they must pass. Some engineers prefer the shaft

to have its longer axis parallel with the strike of the rocks. Others consider it more economical to locate directly across the strike, and still others believe it an advantage to set the shaft diagonally across the formation. If the conditions encountered were constant there might be some advantage in one of these several ideas, but as the hardness and other physical conditions found in sinking are subject to frequent changes, it is doubtful if any one method has a very decided advantage over either of the others.

IN the case of a mining partnership, the copartners owe to each other the same degree of fidelity, good faith and fair dealing as is exacted from ordinary partners, and one of the partners may not carry on the business in any way detrimental to the interests of his partners, or acquire for his own benefit property which rightfully belongs to the partnership (Kimberly vs. Arms, 129 U. S., 512), but so far as the disposal of his own interest in the property, or the purchase of another's interest, where the partnership agreement does not extend to the selling of the property, but only to its development and operation, neither of the partners is under legal obligation to consult with the others. One may sell his interest to a stranger, who thereby becomes a partner, whether the other partners be willing or not.

QUARTZITE often carries values in lead, iron, copper, zinc, etc., as well as gold and silver. Ore bodies occurring in quartzite are usually in the form of infiltrations, rather than as replacements of the original material by ore, by what is known as metasomatic replacement. If a clean quartz sand be infiltrated with a solution of lead, and the lead be deposited in the interstitial spaces as lead sulphide (galena), a cubic foot of such ore would contain about 100 pounds of quartz and 200 pounds of lead sulphide, or about 63% lead, the remainder being sulphur. It is possible to conceive of a richer lead ore than this in sand rock (quartzite) by assuming that a portion of the grains consisted of some soluble material, such as calcite or granules of limestone, and that these had to be replaced by lead sulphide by metasomatism.

BROMINE occurs in nature associated with chlorine, the latter being usually found associated with sodium (for which it has a great affinity), as sodium chloride or common salt. Bromine occurs as sodium bromide or as magnesium bromide in some rock salt beds. It also is found in some artesian salt wells. The principal source of bromine is the mother liquors at salt works. When the two salts, sodium chloride and sodium bromide, are together in solution, by evaporation the solution becomes saturated and sodium chloride is first deposited. Then the mother liquor is drawn off and the bromine with some chlorine is deposited. Bromine is separated from the sodium in the same manner that chlorine is liberated from the salt by treating it with sulphuric acid. Manganese dioxide is usually mixed with the salt before treatment with the acid. The sodium and manganese form sulphates liberating water and bromine—hydrobromic acid. Bromine dissolves in water in the ratio of 1 to 33.3 at 15° C.

A TIMBER-CUTTING ACT was passed June 3, 1878, which provides that citizens of the United States may cut and remove timber from mineral lands for mining purposes. The Act applies to the States of Colorado, Nevada, Montana, Idaho, Wyoming, North Dakota, South Dakota and Utah, and the Territories of New Mexico and Arizona. Following is an abstract of Land Office regulations concerning this Act: "The land from which timber may be felled or removed under the provisions of this Act must be known to be strictly mineral in character. \* \* \* Those cutting and removing the timber must be prepared to prove that the land from which the timber is taken is mineral within the meaning of the Act. \* \* \* The use of the timber is limited to 'building, agricultural, mining or other domestic use. None for smelting purposes. \* \* \* No such timber may be removed for sale or traffic, or to manufacture into lumber for merchandising purposes. No timber so cut may be transported out of the State or Territory where procured. \* \* \* No growing trees of any kind whatsoever less than 8 inches in diameter are permitted to be cut. \* \* \* All of each tree cut must be utilized as far as possible, that there may be no waste." On March 3, 1891, an Act was passed, which was amended July 1, 1898, which permits the cutting of timber on the unreserved public non-mineral lands, under permit of the Secretary of the Interior, for mining and domestic purposes. With the exception of Wyoming, Idaho and Montana, timber so cut must be utilized in the State where it is cut. This cutting of timber, it will be understood, is merely a privilege, and not a right, and this privilege may be enjoyed by a large class of people, miners and others, on both the mineral and non-mineral unclaimed lands. It is not confined to locators or even owners of mineral lands. In the case of cutting timber on claims located on what is alleged by the owners to be mineral land, but which is disputed by others to be of such mineral character, the party adverse to the claim locator must be able to prove that the land is valueless for mineral—a thing sometimes difficult to do in a mineral country, as the courts are very lenient as to what is mineral. And if a locator is willing to do the assessment work required by law on an unprofitable mineral claim, he can probably hold it against all comers and remove the timber.

## Mining in Oregon.

Written for the MINING AND SCIENTIFIC PRESS by H. B. KEADING.

The lower Rogue River valley of Oregon may be taken as that portion of it lying between the mouth of Mule creek and the Pacific ocean; here the river passes between high mountains through what is more a canyon or gorge than a valley, to within 10 miles of its mouth, where it widens a little and presents more the appearance of a valley, with some ranch land. This lower valley lies entirely in the county of Curry, in the State of Oregon, and is about 60 miles long; the country is too mountainous, and taxpayers too few to support a county road, and the entire distance, with the exception of 5 miles at the mouth of the river, must be passed over by means of a very poor and dangerous trail; this necessitates the packing of all machinery and supplies on mule back, except at certain times of the year when boats can be worked up the river. The river is swift and deep, with numerous rapids and stretches of "white water," but is navigable for canoes under an experienced hand for about 40 miles, except at lowest water in the fall.

Deer, grouse, salmon and trout abound; the mountains are covered with dense growths of red, yellow and white fir, some yellow pine, white cedar and sugar pine, and a little spruce. The undergrowth is dense and, in places, impenetrable; the ground is moist, and covered with ferns the year around, and water is abundant, every ravine running with plenty of good water.

Evidences of copper deposits are to be found, but, as yet, nothing permanent has been discovered. Thirty miles from the mouth of the Rogue river the Illinois river empties into the Rogue, and in the country drained by the Illinois are to be found several superficial deposits of carbonate of copper ores, and also some metallic copper. This region is also crossed by the contact between the slates and granitic rocks, with occasional intrusive dikes of rhyolite, and in places on this contact true gossan occurs in deposits of considerable size, but no work has been done on these deeper than 50 feet and at that depth no copper was found.

Several small, and occasionally rich, seams of gold-bearing quartz have been opened on the Rogue river, which are found to occur in the granitic rocks, no veins having yet been discovered on the slate-granite contact. As yet none of these quartz veins have been shown, on development, to have permanency. On the headwaters of Mule creek some local people have been following a promising vein, and encountered some very good ore, and they are starting to install a 5-stamp mill, but on endeavoring to cut the ledge at a depth of 200 feet they failed to find it, and it now seems probable that it was merely a lens of ore in the granite.

Just above what is called Big Bend are what are known as the "Mule Mountain" mines, owned by Portland men, and now under the management of E. B. Burns. These comprise twenty or more claims, and on one of the claims there was a small lens of high-grade ore, which was extracted and shipped, but the lens was small and the supply soon exhausted. This company, however, is pushing development work, in the hope of finding something, and has a 3-stamp mill strewn along the river in various stages of transportation from the mouth, and hope to have the same in operation by next fall.

These two properties are the only ones in this region that have had any work done on them, and as far as the outlook at present is concerned, there is evidently nothing to be expected from these small seams in the granitic rocks; but should veins be discovered on the slate-granite contact they should prove more permanent.

The region, however, abounds in deposits of auriferous gravels. From Mule creek to the mouth of the Rogue river is a succession of gravel bars, and portions of the old channel that show up well. Several of these have been worked by hand with rocker and sluice, and have yielded well; one was worked by hydraulic some time ago, and gave a good yield in bullion, although inexperienced management caused so much needless expenditure that the net profit was small. One mile below the Big Bend is the claim known as the Gold Bar mine, owned by parties living in southern Oregon. These people have been at work for six or seven months ditching and fluming, and hope to begin operations this fall; they are the only ones operating at the present time.

Between the Big Bend and Mule creek is what is known as Paradise bar, and on this is located the Royal Flush mine; this comprises about 110 acres of the old channel, and while no work has been done on the claim except the cutting of two ditches, the outer rim appears to be intact, and this mine is as promising as any in the region. On all of these bars the gold is fairly coarse—"cucumber seed gold"—and while naturally the bulk of the mineral is on the bedrock, colors can always be found in the top dirt. The volume and considerable fall of the Rogue river, as well as the abundant water available in the creeks, timber, etc., make this region one in which hydraulic mining can be carried on under most favorable conditions.

All the ocean beaches, from Bandon to Crescent

City, are rich in gold, platinum and iridosmine, which is present with the black sand; many of these beaches are being worked in winter with sluice, and pay well, despite the fact that much of the precious metal is lost by crude methods. There is little water to be had for beach mining and extensive operations would necessitate a pumping plant taking the water from the surf.

## The Mother Lode in Tuolumne County, California.\*

NUMBER V.

Written for the MINING AND SCIENTIFIC PRESS by W. H. STORMS.

Southward from Quartz mountain the large ankerite lode disappears for an interval of several hundred feet, as it does north of the Dutch mine, where, as previously explained, the lode is not in evidence for about half a mile. The next appearance of the great vein southward from the Santa Ysabel property is on Golden Rule hill, half a mile south of the town of

going southward extending through the New Era claim and into the Jumper. The Golden Rule, New Era and Jumper are all owned by the Jumper company. (See accompanying illustrations).

In the Jumper mine proper the diabase dike is much larger than in the Golden Rule claim, but the general geological conditions are much the same. The superintendent of the Jumper, M. B. Kerr, states that recent developments in the Jumper mine have shown that the calcite seams occurring in the dike, and in the amphibolite schist (forming what are known to pocket miners as "crossings"), have in this mine a definite strike and dip, and that the occurrence of the calcite seams are responsible for the coarse gold deposition characteristic of the mine. The general strike of the lode in the Jumper is nearly N.-S., and these calcite seams strike N.W.-S.E. across the ore body, the seams becoming small and indistinct as the hanging and foot walls are reached. Usually the dip of these seams is 45° to the northward, but occasionally a series of seams is found dipping to the southward. This has encouraged the Jumper company to undertake new explorations in both the north and south series of veinlets in search

Jumper 100-Stamp Mill, Stent, Tuolumne County, Cal.

Jumper Mine, Stent, Tuolumne County, Cal.

Stent. Here it forms another of the ridges characteristic of its course. The foot wall of the main lode is diorite, which is separated from the lode for some distance by a serpentine intrusion which in places is 100 feet wide. A heavy gouge marks the line of separation of the serpentine from the ankerite. The ankerite is soft and much altered and contains abundant mariposite. The large ankerite mass is divided by a dike of diorite similar to the diorite of the west wall. The eastern zone of ankerite is similar to that of the western portion. Large quartz lenses occur in the ankerite, and also gold and auriferous pyrite, but the principal ore-bearing zone is found east of the ankerite in amphibolite schist. This zone of schist is silicified, and in it are veinlets of quartz and calcite, often rich in gold. Along the foot wall of this zone is usually found a narrow vein of quartz and calcite with a small gouge—evidence of movement—and this vein is frequently rich in coarse gold. A dike of diabase has been intruded into this zone also. Often the dike contains a reticulated mass of quartz and calcite veinlets, and when this occurs the dike is treated as ore. These conditions prevail

\* See illustration on front page.

of additional enrichments. Although the Jumper mine has been generally considered a pocket mine, still it has produced a large amount of milling ore, though the greater part of the value is from coarse gold found under the peculiar and interesting geological conditions above mentioned.

This occurrence of gold in connection with seams of calcite which diagonally traverse the lode resembles somewhat an occurrence near Colorado, in Mariposa county, about 7 miles northeast of the town of Mariposa. Here a dike of granulate, or aplite, much altered, and lying between clay slate walls, is traversed by small veins of quartz, much the same as the calcite veins at the Jumper, extending from wall to wall and dipping with more or less regularity. These seams occur at vertical intervals of about 2 feet. The gold is coarse and is found on one wall or the other, where intersected by the quartz seams, and seldom elsewhere in the vein.

Southward from the Jumper mine the next property is the Mazeppa. (See illustration front page). There are three distinct zones of mineralization in the Mazeppa mine, all in the amphibolite schist, and on each of which more or less development work has

been done, and in the main workings considerable gold has been found, chiefly in the form of pockets. The geological conditions, however, are different from those at the Jumper group. There still remains a large amount of ground to be explored at the Mazeppa. The ankerite vein is not in evidence on the surface in this property as far as known to the writer.

(TO BE CONTINUED.)

### Flumes and Their Construction.\*

There is nothing so essential to the operation of mining property as water. In fact, without it there are only a few mines that could exist at all, and even these—high-grade shipping mines—must have a domestic supply. The next most important matter is the conveying of water from its bed in the bottom of a canyon to a point where it can be utilized to advantage at the mine, mill or smelter. The largest consumers of water are hydraulic mines. These employ from 750 to 7500 cubic feet of water per minute, and sometimes more, according to the magnitude of operations. The next largest consumer of water per ton of material treated is a concentrating mill; but mills and reduction works of every kind must have water for metallurgical operations, and mines and mills frequently employ water under pressure as a means of motive power, either directly applied or

line, or the topography of the country, which latter condition nothing could better illustrate than the engraving on the front page, for which we are indebted to the courtesy of the Sunset Magazine. It illustrates one of the most noted flume constructions in the world, and shows how a serious obstacle to the construction of a large canal was ingeniously overcome by W. H. Bellows, who constructed it for the Miocene Mining Co. in Butte county, Cal. The water had been conveyed in a ditch for several miles, and, turning around the side of a mountain, the line was run several hundred feet up the canyon, where it

hand a mine systematically developed with large reserves of payable ore is the surest and withal the most satisfactory investment one can make, and this is coming to be appreciated more and more.

### The Need of Geological Knowledge.

TO THE EDITOR:—I send you a sketch of a badly faulted copper vein showing the results of "going it blind" in mining. Here is a large contact vein 450 feet wide and visible along the surface for a number

Series of Block Faults Dislocating Copper Vein.

came up to a perpendicular cliff of andesite. A flume was built, nearly 100 feet high, when this mode of construction was abandoned for what is known as the "bracket flume." To construct this, men were lowered in slings over 200 feet from the top of the cliff to the flume level (118 feet above the foot of the cliff), and along this level holes were drilled into the volcanic rock. Into these holes the ends of brackets, made of 30-pound railroad iron bent in the shape of the letter L, were inserted. The longer arm—10 feet in length—was placed horizontally and secured in the drill hole, the other end turning upward. Upon this line of brackets, 8 feet apart, the flume was built. The upright end, 2 feet high, was provided with an eye, into which was inserted a hook at the end of an iron rod, the upper end of which was soldered into holes drilled into the cliff above the level of the flume. The flume is 4 feet wide, 3 feet deep, and has a carrying capacity of 2000 cubic feet per minute. On this same ditch line is one flume over 1000 feet long and 80 feet high, and another flume was built 136 feet high, which is unusually high for a flume of such large capacity.

The accompanying sketches (Figs. 1 and 2) show the usual methods of flume construction under the varying conditions usually met with in the mountains. The bases are usually built on sills of timber and in some instances on blocks of masonry or concrete. Where the rocks are rough, and neither ditch nor tunnel work is advisable, the flume is built as shown in Fig. 2, or some modification of it. There is always more or less latitude allowable in a construction of this character. Where the flumes become very high, the understructure must be built with great care, and much extra bracing must be provided, as the flume must not only be strong enough to carry the weight of lumber and water, but must be able to withstand the severe stresses due to heavy winds.

Two flumes of the same dimensions may have greatly differing carrying capacity, due to their respective grade. Some of the California power flumes are of large size. An illustration on the front page is that of the Melones Co., near Robinsons, Calaveras county, Cal., which carries 6000 miners' inches (about 4000 cubic feet) per minute, built at a grade of  $\frac{1}{8}$  inch per 16 feet—about 35 feet per mile. A. J. Bowie gives as the cost of construction of the Milton ditch in California—flume 28,056 feet long: Cost of excavation, 67 cents per linear foot; cost of lumber, labor, etc., \$2.12 per foot; total cost, \$2.79 per running foot. This flume was built on the plan indicated in Fig. 2. The grades of various large flumes and ditches in California are said by Bowie to be from 4 feet to as much as 32 feet per mile. Heavier grades admit of smaller excavations or flumes. The Milton ditch grade varies from 16 to 32 feet per mile, and carries 3000 miners' inches. The ditch was built 7.65 feet on top, 4 feet bottom, and  $3\frac{1}{2}$  feet deep.

AN undeveloped mining property, no matter how promising, always involves an element of uncertainty and speculation, and there are many who prefer this kind of an investment, but on the other

of miles. The vein matter is diorite and mica schist containing a number of quartz ledges from 1 to 30 feet wide, carrying chalcopyrite of low grade. The ore was evidently deposited in the ledges before the faulting occurred and was consequently very badly broken up for perhaps 50 feet each side of the faults. The foot wall is red granite and the hanging wall a hard, white quartzite. The surface is entirely barren of vegetation, so the formation and faults were easily traced. The original locators put down a number of holes from 20 to 60 feet on the surface outcrop, then decided to run a crosscut tunnel from the base of the hill. After accomplishing about 1000 feet of tunnel, with no good results, they sold to a company who drove the tunnel to a point about 1700 feet from the portal with very little success in finding ore of any value or quantity, having followed so closely the worst fault fissure in the whole system. There is a reasonable probability that if the tunnel had been run on the original line as started, much better ore bodies would have been found. There was a 50-ton concentrator, boarding and bunk houses, shops and stables, and including development and surface improvements, an outlay of about \$75,000. The property has been idle for three years, lacking funds, but in all probability if the work had been directed by a competent superintendent, much better results would have been obtained.

PH. REARDEN.

### Explosion of a Powder Thawer.

TO THE EDITOR:—The article on powder thawing in your issue of October 8th is interesting for the facts presented, but I may be permitted to say that it is dangerous for the advice it gives. No dynamite thawer should ever under any circumstances have direct heat from a candle, stove or hot coals, applied to it while the dynamite is in the thawer. The number of accidents from failure to observe the rule are exceedingly numerous, usually reaching about fifty in England annually (where exact statistics are kept), and exceeding that number in the United States, according to private records, which are necessarily incomplete.

Dynamite is liable to leak nitroglycerine during the process of thawing, if the dynamite is old stock, or has been damp, causing efflorescence of the contained sodium nitrate. Consequently the thawer gradually accumulates nitroglycerine in the tubes, or in the inner bucket, if the gluepot type of thawer is used, causing great danger of accidental explosions. Thawers should be regularly and thoroughly washed every day with a warm strong solution of sodium carbonate (sal soda), which destroys the nitroglycerine.

Thawers should be of large size, the water-containing portion especially being of ample size to hold enough hot water to thaw the entire batch of cartridges. This means that the thawer should be much larger than those commonly offered for sale. Thawing in front of stoves, or over open fires, is exceedingly perilous. Only the remarkable skill and scrupulous honesty of explosive manufacturers in making explosives of the purest chemicals, and with the most careful attention to the details of manufacture, save

FIG. 1.

FIG. 2.

indirectly through the medium of electricity. To bring the water from the canyon bed to a point several hundred feet higher than the mine works or mill requires usually several miles of conduit of some sort. The cheapest method of conveying water is by means of a ditch excavated along the mountain side, in earth or rock, but at times there are found conditions which make a ditch more expensive than some other means of conveyance, such as a flume or pipe line, owing to the hardness of the rock on the ditch

\*See illustrations on front page.

the majority of dynamite users from paying with their lives for their reckless disregard of ordinary precautions in the handling of powders.

A MINING ENGINEER.

## Crushing in Cyanide Solution as Carried on in the Black Hills, S. D.\*

NUMBER V.

Written by C. H. FULTON.

The method of filling formerly employed at the first wet crushing plants of the Hills, the Portland and the Dakota mills, was the indirect method, settling boxes with two compartments being used, these compartments alternately discharging their contents into the sand vats below, where the charges were raked over and leveled off. At the Dakota mill double treatment of the sands was also resorted to, but discarded as unnecessary after a year's trial. The settling boxes were found to be such inefficient classifiers that the cone system described was evolved and the sands charged at some of the mills, by distributors into the sand vats filled with solution. All of the plants, however, soon adopted the method of "dry filling" described as more satisfactory.

The general method of the treatment of the sands is the same at all of the mills, although the amount of solutions and the time of treatment varies. The treatment of the sands is determined as far as extraction will permit by the problem of handling the mill solutions, which in a plant of the type under discussion is quite complex as might be expected.

The following table shows some of the details of sand treatment:

NAME OF MILL.	Capacity of Tank, Tons.	Amount of Solution While Filling, Tons.	Amount of Battery Solution, Tons.	Amount of Battery Solution, Tons.	Amount of Wash Water, Tons.	Total Time, Days.
Maitland..	140	700	900	450	15	16
Dakota.....	115	.....	86	63	20	5
Horseshoe..	350	400	.....	.....	.....	8

Solutions are leaching through the sands continually, there being no "contact" or solution standing on the ore as in dry crushing mills. There is also no strong solution properly so called, although the battery solution and the barren solution differ slightly in strength, in some mills the barren solution being the stronger, while in others the battery solution is the stronger. At the Maitland mill the battery solution carries 1.20 to 1.30 pounds of cyanide per ton, and the barren solution 1.50 to 1.60 pounds per ton. At the Horseshoe mill the battery solution carries 1.4 pound of cyanide per ton and the barren solution is somewhat stronger, though of indefinite strength. At the Horseshoe mill the overflow solution from the slimes vats, while these are filling, is standardized in a sump tank up to three to four pounds of cyanide and then run through the sands. At the Dakota mill the battery solution contains 2.2 pounds of cyanide per ton and barren solution two pounds per ton. At the Lundborg, Dorr & Wilson mill, the battery solution contains two pounds of cyanide per ton, and at the Hidden Fortune mill it contains 1.3 pound per ton. The amount of wash water varies but little at the different mills, amounting to 0.1 to 0.2 ton per ton of sand. Little wash water is required, as the cyanide solutions are all weak and such large amounts of solution are passed through the sands in most of the mills. The deficit of solutions in the mills is made up mainly from wash water added in the slimes treatment.

The following figures show the result on sands obtained at the Dakota mill, over a period of 5.50 months: The average value of the ore was \$4.75 per ton. The sand tailings averaged \$1.22 per ton. This gives an extraction of 74.25% on the sands. The moisture going out with the sand tailings had a value of 40 cents per ton. During May, 1904, the average value of the ore was \$4.55 per ton. The average value of the sand heads as charged into the vats was \$2.60 per ton, the average value of the sand tails unwashed was \$1.06 per ton, giving an extraction of 76.7% on the sands. Comparing the original value of the ore, the sand heads and the sand tails, it is evident that 42.8% of the extraction takes place in the batteries and cones and 33.9% during the sand treatment proper.

At the Hidden Fortune mill the extraction on the sands averages 75%. For the extraction on the slimes and the total extraction reference is made to the figures given under slimes treatment.

THE TREATMENT OF THE SLIMES BY AGITATION AND DECONTANTION.—There are two systems of slimes treatment practiced in the Hills.

1. That in which the treatment of the slimes is completed in the vat into which they are originally charged, and in which most of the agitation is performed by compressed air.

2. That in which the slimes are successively trans-

ferred from one vat to another, there being generally three to four transfers before the slimes are discharged. The agitation in this case is done by means of centrifugal pumps.

The first method is practiced at the Horseshoe mill as follows: There are sixteen slimes tanks, 14 feet in diameter and 10 feet deep, and two 30 feet diameter and 16 feet deep. The arrangement of a slimes tank is shown in the accompanying figure. A partition curtain runs down to nearly the bottom at one side of the tank behind which the slimes are charged as they come from the cones. Before charg-

Slimes Vat and Accessories.

ing slimes the vat is filled with barren solution, then the slimes are run in, the surplus solution running off clear at the lip, any foam being held back by a strip of wood or lath resting on the surface of the solution. Four to six pounds of lime are added per ton of ore at the batteries for the coagulation of the slimes, this being the only addition of lime made in the mill. The addition of lime must be somewhat nicely adjusted, as too little lime fails to coagulate the slimes readily and too much gives trouble in the precipitation of the values later on. The slimes settle rapidly and the solution usually runs off clear at the lip until the slimes have accumulated to the extent of about 50 inches, equivalent to about twenty-five to thirty tons of dry slimes. When the solution at the lip becomes cloudy the slimes charge is turned into the next tank and the slimes in the tank just filled are permitted to settle. This settling takes about ten hours. While the slimes are settling the supernatant solution is decanted off by means of a decanting device, which is a simple wooden frame with a pipe at the center, which is connected with a take-off pipe about 18 inches from the bottom of the vat. (See lower sketch). It is important to permit the slimes to settle as low as they possibly can and to decant as closely as possible without taking any of the muddy solution. The object of the slimes treatment in the main is to remove by successive dilutions the dissolved values, so that it is evident, unless the decantation is as close as possible each time, it partly fails in its object. The solution can usually be decanted within an inch of the settled slimes. When the decantation is complete a wash of barren solution is added, amounting generally to forty tons, and during the addition of this charge is agitated by compressed air at forty pounds pressure per square inch. The air is introduced on the bottom of the vat through two S shaped pipes crossing each other, and having

0.12 inch perforations. The only agitation the slimes receive is that obtained by the air. The agitation by air alone is a weak point, in that it fails to move all of the material, especially the heavier portion of the slimes and the fine sands at the bottom of the vat. For that reason on discharging a vat it is not sluiced out, but what slimes will run out by the bottom gates are let go, and the heavy thick slimes remaining, amounting to two to four tons per charge, form again a portion of the next charge, thus getting two treatments. Each charge of slimes gets four to six washes with barren solution and one wash

with water, each wash amounting to forty tons. This gives 6.5 tons of barren solution and 1 to 1.6 tons of wash water for each ton of dry slimes treated.

The slimes as discharged contain very close to 50% moisture. From ore averaging \$8 to \$9 per ton dried slimes tailings average \$1.75 per ton, 30% to 40% of which still existed as gold in solution. This gives the washed slimes tailings a value of \$1.24 per ton and the solution discharged as moisture, a value of 50 cents per ton.

In the treatment of slimes by successive dilutions for the extraction of the values where, in the total treatment a definite amount of solution is used per ton of dry slimes, it is theoretically required in order to get the maximum extraction, to use the amount of solution in a comparatively large number of dilutions of small amount each time, rather than a few dilutions of large amount each time. Thus, in treating a ton of slimes with six tons of solution, it is theoretically better to give six dilutions of one ton each, rather than two dilutions of three tons each. If any one dilution is larger than the other it should, of course, be applied when the slimes are highest in value. It must be borne in mind, however, that in the slimes treatment there is a solution of values constantly going on during the treatment, so that while the solution is being reduced in value by dilution it is constantly being augmented by the solution of new values, so that the solution finally discharged as moisture with the slimes tails will never be as low in value as the dilution calls for. Since the cost of applying a dilution of definite quantity to the slimes is the same, no matter what the value extracted by the dilution is, it will be seen that the economic limit is soon reached where further dilution will not pay. Few of the mills can afford to apply more than four

to five dilutions profitably. It must also be borne in mind that with an increased number of dilutions the amount of solutions to be handled in the mill will increase. As it is, at present the mill handles a great quantity of solution per day. The application of an extra water wash to the slimes would, however, not be so objectionable if the decantations from the last wash were run to waste through a large zinc box in which the poorer grade of shavings and the dust from the lathe could be utilized. The saving made in this way would probably be appreciable.

(TO BE CONTINUED.)

THE White Knob Copper Co., of Mackay, Idaho, furnishes another object lesson in too hasty equipment with reduction plant of an undeveloped property. The smelter has a capacity of 600 tons of ore daily. This the mine supplied for a time, but it was unable to keep up with the demand, and the property has now passed into the hands of a receiver who will continue to operate the mine, first doing the necessary development work to insure a supply of ore. The smelters have been run spasmodically since 1902, blowing in and blowing out repeatedly.

A REMARKABLE discovery of tin is reported at Port Darwin, Australia, said to be owned by two half-caste Chinamen. The tin had been found some distance from Port Darwin, and the field promises to be rich. A steamer lately took from Port Darwin sixty tons of tin ore, consigned to Sydney, which was said to be 75% pure tin, and is worth about £80 per ton. It is stated that the whole of this tin had been taken from an area of ground not covering more than 25 yards, which has been worked to a depth of 4 feet. This open out-work is below an outcrop of quartz, thickly studded with tin ore.

## Geology of the Treadwell Ore Deposits, Douglas Island, Alaska.\*

NUMBER III.

Written by ARTHUR C. SPENCER.

**NATURE AND DATE OF VEINS.**—The instances of veining and the sulphide deposits which have been cursorily noted indicate that the region in which the Treadwell mines are situated is one of the very generally distributed mineralization. Most of the occurrences of metallic sulphides which carry gold or silver, or both, are in veins largely composed of quartz, or in limited impregnations of the country rock adjacent to such fillings. All the deposits thus far productive throughout the whole belt are of this nature, and the more detailed descriptions which follow will show the Treadwell ores are closely related to the same type. The gold quartz veins are regarded as of essentially contemporaneous origin throughout, because in general the pre-mineral fractures are nearly all referable to two or three simple, but extensive, systems of fractures, and detailed examinations have not furnished evidence of more than one period of vein deposition, such as reopening of fissures or faulting of veins by distinctly later fillings.

Fig. 5—Cross Section Through Alaska-Treadwell Mine, Douglas Island.

Fig. 7—Ore Dike in 700-Foot Mine.

Fig. 8—Mineralized Diorite in Treadwell Mine.

Fig. 6.

The only other type of metallic impregnation which has been recognized is exemplified in the altered and mineralized masses of greenstone on the outer side of Douglas island. Here the mineralization is regarded as mainly due to hydrothermal action, involving addition of materials, rather than to dynamic metamorphism bringing about a concentration of materials already present in the rocks.

The occurrence of segregated veinlets in the otherwise thoroughly impregnated rock requires either a period of migration and reconcentration, following that of first deposition, or a second distinct period of mineralization. Known data do not permit a close correlation of either of these features with the widely distributed metalliferous quartz veins of the region, though on the face of things the original mineralization is more likely to correspond than the secondary veining.

Without presenting the necessarily extended chain of circumstantial evidence involved in our present knowledge of the geological date of the gold veins in southeastern Alaska, it may be stated that they are later than the great diorite intrusions now regarded as younger than the middle Jurassic. They therefore correspond, in a general way, with the similar gold and silver veins occurring throughout the Sierra Nevada mountains of California and the geologically similar regions in Oregon, Washington and British Columbia. Their deposition is referred to a period of active water circulation more or less directly consequent upon the invasion of the dioritic rocks occurring in the Coast range and outlying intrusions.

**GEOLOGY OF TREADWELL DEPOSIT.**—The Treadwell ore bodies consist mainly of mineralized albite-diorite, occurring in the form of intrusive dikes in black slates, the structure of which they closely follow. These slates are metamorphosed shales in which both original bedding and slaty structure strike northwest and southeast, and dip about 50° on the average toward the northeast (Fig. 5). The ore-bearing dikes belong to a series of intrusions which appear interruptedly along the strike for a distance of about 3 miles, in a zone approximately 3000 feet wide. In the greater part of the intruded area ex-

posures are few, and only small dikes outcrop on the side toward the center of the island. On this side the zone seems to be irregularly limited, but next to the shore of Gastineau channel the border is defined by a heavy bed of greenstone running parallel with the slates and the intrusive dikes, and dipping with them toward the adjacent channel. The mineralized dikes which constitute the known minable ore occur just beneath this greenstone, which thus constitutes the hanging wall both of the intrusion zone and of the ore bodies. Many of the dikes of albite-diorite away from the hanging wall have been greatly altered and impregnated with pyrite, but the workable ore bodies have not yet been discovered in them.

The strike of the different rocks is regular in the main, and, being slightly oblique to the channel, the outcrops of the ore bodies recede from the shore toward the northwest (Fig. 6). The base of the greenstone hanging wall strikes the shore of the island about 1 mile below the Ready Bullion mine, at first running inland, and then back to a point below high water just beyond where the southernmost body of diorite is exposed in the open pits of the Ready Bullion mine. Reappearing within a few hundred feet, it bends sharply and is next exposed in the southeast pits of the Mexican mine. From this point it is traceable in a nearly straight line through the Seven Hundred Foot and Treadwell workings, and

tion and structure. In the vicinity of the Ready Bullion mine the rock is granular, consisting mainly of coarsely crystallized hornblende, though it contains a great deal of magnetite and some pyrite. A specimen from the Mexican workings, which might be called andesite, contains porphyritic crystals of plagioclase and augite in a decomposed ground mass, which seems to have consisted largely of small prismatic feldspar crystals. The secondary minerals are chlorite, epidote, serpentine and calcite. Beyond the workings toward the northwest the greenstone is a fine-grained diabase.

The greenstone was called gabbro by Becker, who regarded it as later than the rock of the ore bodies, but there is now sufficient evidence to establish the opposite age relation, and reasons exist for doubting its intrusive nature. The inclusions of light-colored rock fragments in the greenstone, which form the basis of Becker's conclusions, are represented in his collection by a specimen and a thin section, showing a distinctly outlined fragment of grayish granitoid rock enclosed in greenstone; but the diagnostic value of this occurrence is open to doubt, since at several points in the region pebbles and fragments of similar mineral occur in the volcanic greenstone breccias at different horizons in the series of interbedded slates and greenstones, showing the existence of an available source of granitoid prior to the deposition of the slates and the outpouring of the contemporaneous lavas.

In the open pits of the Seven Hundred Foot and Mexican mines the exposed lower part of the greenstone bed is very schistose, and this slaty rock forms both walls of the ore body. Between the ore and the black slate usually forming the foot wall there is a plate or layer of chloritic schist of somewhat variable thickness, evidently identical with the schistose or slaty greenstone of the immediate hanging wall,

for a distance of several miles beyond.

In the vicinity of the mines there are no dikes of diorite on the channel side of the greenstone, but about 1 mile to the northwest two croppings have been noted, and Juneau island, in Gastineau channel about 2000 feet from the foot wall, is composed of similar rock, which is somewhat impregnated with pyrite.

Besides the mineralization of the igneous dikes, the black slates of the same general belt on both sides of the greenstone band contained occasional veins and systems of quartz stringers following the structure. Veining of this sort has been particularly noted along the foot wall of the Treadwell greenstone for a distance of several miles beyond the mines. Assays of about \$6 per ton in value have been obtained in some places, but there has been no systematic attempt to develop these stringer leads, and their value is doubtful.

The rocks occurring in and near the mines, which will now be described in greater detail, are the following: The greenstone hanging wall; the slate country, enclosing both greenstone and ore bodies; the dikes and lenticular masses of diorite, some of which constitute the ore; and a few small dikes of basalt.

**THE GREENSTONE.**—The hanging wall greenstone forms a prominent bed or stratum about 300 feet in thickness where measured in the mines, but varying somewhat from this figure in different parts of its outcrop. So far as can be determined, it follows the structure of the slates, striking with them from southeast to northwest, then dipping northeast toward the near-by channel, beneath which it has been followed to a depth of 900 feet in the lowest workings. The outcrop is practically continuous for 4 miles northward from where the greenstone first appears on the shore of Douglas island. Then the bed thins out and is wanting for a few hundred feet, but it soon reappears and may be followed for an additional 2 miles, until it is lost beneath a heavy covering of vegetation.

As a rule, the rock is greatly altered, and in places it is even schistose or slaty, but portions are sufficiently unchanged to indicate the original composi-

and the latter grades off into the massive rock (Fig. 7). This relation suggests that the locally developed schistosity of the greenstone existed before the intrusion of the diorite dikes, or was produced at the time of their invasion, and in either case the greenstone must be the older rock. More definite evidence in the same direction was noted in an old stope above the 220-foot level in the Treadwell mine. Here the main mass of diorite lies below all of the greenstone, but the latter is somewhat schistose, and a narrow offshoot from the diorite cuts across this secondary structure for a distance of about 3 feet, and then follows the schistosity parallel with the wall of the large ore body (Fig. 8).

(TO BE CONTINUED.)

## THE PROSPECTOR.

The prospector should make himself acquainted with the laws relative to mineral lands, and the manner of acquiring them by location. The laws are plain and need only be followed carefully to avoid litigation. The locator should always bear in mind the fact that his claim, when first located, has only speculative, if any, value, and that mines are made, not found. It is advisable, therefore, to follow closely the requirements of the statutes in order to protect a claim which may become very valuable upon development. It is then his troubles will begin unless he has complied absolutely with the law.

The mineral sample from Cerrillos, N. M., is specular hematite, a variety of iron oxide. It is slightly magnetic; valuable as an ore of iron if in large quantities; when pure, contains 70% iron, 30% oxygen.

The ore samples from Williams, Ariz., are: 1. Malachite (a fibrous variety), green copper carbonate. 2. Iron oxide, with a little azurite (blue copper carbonate).

The rock specimen from Vanderbilt, Cal., is not turquoise, but chrysocolla (copper silicate).

\* Abstract Am. Inst. Min. Engs.

# Mining and Metallurgical Patents.

PATENTS ISSUED OCTOBER 11, 1904.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

ROCK DRILLING MACHINE.—No. 771,625; C. Gillieron, Vierge, Switzerland.

Rock drilling machine, comprising combination of rotative shaft for carrying drill; independently controlled advance screw; and spring controlled coupling device connected with opposing extremities of shaft and advance screw, coupling device transmitting to shaft longitudinal movements of screw in both directions.

METHOD OF SEPARATING DUST FROM DUST-LADEN AIR.—No. 771,691; W. E. Allington, Saginaw, Mich.

Method of separating dust from initial current of dust-laden air, which consists in continuously and rapidly rotating central column of dust-laden air within outer surrounding continuously rotating body of air of less velocity receiving impulse from column and into which dust separated from column is driven, and continuously delivering dust from body of low velocity by action of body while purified air continuously escapes from one end of column of high velocity.

DRY SEPARATOR.—No. 771,805; F. O. Bloom, Helena, Mont.

Combination in dry separator of coarse screen for separating fine particles from coarser, drier disposed beneath screen and having discharge opening for dry material, means for simultaneously imparting

movement to screen and drier, sieve mounted on under side of drier beneath discharge opening, and finer screen disposed beneath sieve.

PROCESS OF OBTAINING METALS.—No. 771,646; F. von Kugelgen, Holcombs Rock, Va., and H. Danneel, Breslau, Germany.

Process which consists in electrolyzing a haloid of alkali in presence of oxide of metal, thus obtaining metal, oxide of alkali and halogen, and maintaining a supply of haloid and oxide by adding fresh quantities thereof as they are decomposed.

PNEUMATIC GOLD SEPARATOR.—No. 771,857; W. Broadbent, Salt Lake City, Utah.

Combination with tank of two side casings with feed openings therein, depression provided with opening and closure therefor in bottom of each side casing, shaft extending through side casings and tank carrying adjustable conveyor blades within side casings, sprocket wheels on shaft for driving from second shaft, and carrying perforated buckets, and means for delivering short puffs of air within side openings near bottom of depressions.

TUBULAR BALL MILL.—No. 772,077; M. F. Abbe, New York, N. Y.

In tubular ball mill, combination with cylinder provided with spiral feedway at either end for entrance and discharge of material, of feed chamber exterior to spiral feedway provided with central opening, stationary hopper passing through central opening and discharging into feed chamber, and bifurcated pipe provided with oval-shaped openings at one end, one

opening arranged at either side of stationary hopper, and with one circular opening at other end terminating in central part of spiral feedway for conducting air from exterior to interior of cylinder.

DEVICE FOR OPENING THE END GATES OF MINE CARS.—No. 772,268; S. W. Ault, Glencoe, and P. K. Reed, Warnock, Ohio.

Device for automatically opening end gates of mine cars, combination consisting of self-dumping car provided with hinged end gate, beams 9 hinged to frame above and means for supporting same, beam 16, loosely connected to beams 9, connecting rods 20, ends of which are attached to beams 9 and cross-beam 16, in manner that, when rear ends of beams 9 are elevated by contact with ascending cage end-gate of car will be opened.

CRUCIBLE FURNACE AND CRUCIBLE.—No. 771,675; G. L. Smith, Newport News, Va.

In crucible furnace, combination of crucible having gravity discharge spout, means for stoppering same at inner extremity, body of resistant material inclosing crucible provided on inner surface with continuous spiral passage and pierced by series of burners disposed tangentially to crucible distributed throughout extent of spiral and sealed into body, annular space between crucible and body and removable cover in top of body located centrally of crucible and smaller in diameter than crucible to permit access to crucible without exposing interior of furnace to air or operator to heat radiated by walls of furnace.

LONGITUDINALLY ADJUSTABLE CRUSHING ROLLS.—No. 771,887; J. A. Thomas, Los Angeles, Cal.

Combination with journal boxes, of shaft rotatably and longitudinally movable therein, roll fixed on shaft, shaft provided with transverse perforations or slots, gibs in slots adapted to exert pressure against journal boxes, keys bearing against gibs and against shaft, and means operatively connecting gibs and keys whereby same may be operated to move shaft longitudinally.

## The Genesis of the Diamond.\*

NUMBER III.—CONCLUDED.

Written by GARDNER F. WILLIAMS.

Owing to the cost of the material to be experimented upon, however, Herr Luzi was unable to determine positively what chemical action took place during the time the diamonds were heated in the complicated silica flux. The fact that diamonds can be absorbed by being placed in molten blue ground tends to prove that the blue ground was not thrust up through the earth's crust in a molten state.

If the diamond is unable to withstand the corroding influence of the silica magma at the comparatively low temperature given above, how could it possibly have retained its forms of crystallization and perfect faces at the far higher temperature and pressure which must have existed under the igneous theory?

It seems a pity that Herr Luzi did not state the exact weight of the diamonds upon which he experimented, both before and after his experiments. The burning or absorption of the diamonds in its matrix is a strong argument against the contention that the blue ground was once a molten lava. If a diamond placed in a graphite crucible containing melted blue ground, which is subjected to a temperature of only 1770° R., changes in shape, could diamonds be found perfect in shape, without a flaw, and with clear transparent faces, so smooth that they have the appearance of having been polished?

3. Some years ago a diamond weighing 28.5 carats, found at Kimberley, attracted the attention of the valuator. Its external surface was smooth and crystallized, showing no other mineral except the diamond itself, but the interior was white and not transparent. Noticing this peculiar appearance, the valuator broke the stone in order to satisfy his curiosity, and found that a small perfect octahedral diamond was enclosed in the center of the larger stone. Nor was this all. There were flakes of a white mineral, not diamond, attached to the fragments of the broken diamond. In appearance the flakes were white, translucent and crystalline and about as hard as steel. When heated in a closed tube, moisture was given off. It fused readily on platinum wire to a white bead. A few grains of this white mineral were collected, and by analysis it proved to be apophyllite, a silicate of lime and potash with 16% of water.

If a mineral which is fusible at the ordinary temperature obtained with a blow pipe, and which contains 16% of water, was formed at the same time that the diamond crystallized, it is certain that this did not take place under an enormously high temperature. How, then, one may ask, did the apophyllite become a part of this diamond?

Herr von Tschudi describes a beautiful crystallized Brazilian diamond in the center of which was a leaf of gold. He obtained the information from Dr. Mills Franco, who claimed that there was no doubt or deception as to the identification of the gold.

Occurrences of this nature tend to veil in additional mystery the genesis of the diamond.

4. Professor T. G. Bonney obtained from the Newlands mines, 40 miles northwest of Kimberley, specimens of a coarsely crystalline rock studded with garnets, technically called holo-crystalline, and allied to eclogites. At a meeting of the Royal Society, he presented his conclusions:

The blue ground is not the birthplace, either of the diamond or of the garnet, pyroxenes, olivine and other minerals, more or less fragmental, which it incorporates. The diamond is a constituent of the eclogite, just as much as a zircon may be a constituent of a granite or a syenite. . . . I had always expected a peridotite (as supposed by Professor Lewis), if not a material yet more basic, would prove to be the birthplace of the diamond.

Can it possibly be a derivative mineral, even in the eclogite? Had it crystallized out of a more basic magma, which, however, was still molten when one more acid was injected and the mixture became such as to form eclogite? But I content myself with indicating a difficulty and suggesting a possibility; the fact itself is indisputable; that the diamond occurs, though rather sporadically, as a constituent of an eclogite, which rock, according to the ordinary rules of inference, would be regarded as its birthplace.

Professor Bonney's statement that diamonds occur in the eclogite of the Newlands mines caused me to examine the eclogite which is found in all the mines at Kimberley, and has always been treated as waste rock and thrown away. There are tons of it lying about the Kimberley mines. I have examined hundreds of pieces of this rock, but never found a diamond; nor have I ever heard of a diamond being found in it by any one during the many years that these fields have been worked. I caused about twenty tons to be collected and sent to a test plant, where it was crushed and afterwards jigged; but it contained no diamonds. Surely, if in the eclogites of a poor mine like the Newlands, the total diamond yield of which was only a few hundred carats, one could find diamonds, one would naturally expect to find them in the eclogites from mines in the vicinity of Kimberley, which are so rich.

5. Sir William Crookes and others have mentioned

Tunnel Entrance Raymond Con. Mine, Ohio City, Colo. (See Page 281.)

General View of Raymond Con. Mine, Ohio City, Colo. (See Page 281.)

diamonds which burst or explode on being brought to the surface; and Sir William says it has been "conclusively proved that the diamond's genesis must have taken place at great depths under enormous pressure. The explosion of large diamonds on coming to the surface shows extreme tension."

Professor Lewis says that Kimberley diamonds have been found sometimes to have optical anomalies due to strain. Fizzan thought this strain to have been caused by the unequal distribution of heat during cooling; but Jaunettaz holds that the strain is due to compressed gas in the interior of the crystal.

I have found that the light-brown smoky diamonds are the only ones which crack on being brought to the surface; but even these remain intact if kept in a moist place. In the days of open-cut working, when a smoky or light-brown diamond was found, the digger placed it in his mouth, where he kept it until he offered it for sale. The buyer placed it in a raw potato, in which it was shipped to Europe. The temperature of the ground in which the stone was found would, as a rule, not exceed 70° F. The temperature of the diamond would be raised to 98° F. while in the digger's mouth. If, however, the stone was kept in a dry place, even at a lower temperature, it would crack in all directions. One might argue from this that it was not the expansion of gases by heat alone which caused the fractures. If these fractures were due to compressed gas, as contended by Jaunettaz, one might expect this cracking to have occurred while the diamond and its contained gas were exposed to the enormous heat to which, according to the igneous theory, diamonds must have been exposed.

It is a strange fact that only light-brown or smoky stones crack on being exposed to dry air at a slightly increased temperature. There are innumerable fragments of diamonds in the Kimberley pipes; and it is a question of how the original crystals were fractured.

6. Sir William Crookes says that the ash left after burning a diamond invariably contains iron as its chief constituent, and the most common colors of diamonds, when most perfectly pellucid, show various shades of brown and yellow from the palest "off color" to almost black. These variations, he declares, accord with the theory that the diamond has separated from molten iron.

I have made exhaustive tests in order to ascertain whether diamonds contain iron, oxidized or metallic. The experiments were made upon a magnetic separating machine, the field magnets of which attracted any mineral containing iron or iron oxides. Although some of these diamonds had the appearance of being coated with iron in some form, and others were colored dark brown and deep yellow, they were in no way attracted by the magnet, even when excited by a strong electric current. These experiments do not, perhaps, disprove the existence of iron in the diamond, but they do establish the fact that the quantity is infinitesimally small. Further experiments in this direction ought to be made by those who have better facilities for such work than are at our disposal here in Kimberley.

7. From what is known of the theory of crystallization, one is inclined to the old Indian idea that diamonds grow like onions. It is hardly conceivable that diamonds, such as the Koh-i-nur, the Great Mogul, the Excelsior (a Jagersfontein, South African stone of 969.5 carats) and the two De Beers diamonds (respectively of 503 and 428.5 carats) were formed, as the microscopical diamonds have been, in a moment of time during the sudden cooling of molten iron.

Is it not more reasonable to suppose that these enormous crystals grew little by little, and that nature has followed the same laws of crystallization in the diamond as in other minerals?

In March, 1904, a diamond of 228 carats was found in the Kimberley mine which contains two red spots in the center of the stone. One of these is bright red, and, under a magnifying glass, is shown to be a small diamond with crystalline faces easily distinguishable. The large diamond is cracked in all directions around the small crystal for a distance of about  $\frac{1}{16}$  inch.

I regret that I am unable to propound a detailed theory as to the genesis of the diamond that could be supported by data less assailable and more conclusive than those given by others.

I have suggested difficulties which have occurred to me in reference to various theories and which leave the subject still obscure.

All that can be said is, that carbon has been changed by crystallization from its black and uninviting appearance to the most beautiful gem which ever saw the light of day.

### An Automatic Loader.

TO THE EDITOR:—I note in your valued paper an illustration of the loading machine built for the Empire Tunnel Co. at Georgetown, Colo., and in the descriptive article it is stated that it is doubtful if there is another mine in the world that has a loading machine. I can say that in my mining experience of twenty years throughout the West I never heard of a successful loading machine; however, from the illustration I cannot see anything more than a conveyor, and I believe a machine on this same principle was used in the Bunker Hill & Sullivan mines in Idaho, but the material had to be shoveled onto it, and it seems to me the same will have to be done in this case. This, however, is a great saving over shoveling into a car 4½ feet high, whereas the lower end of the conveyor need only be 15 to 25 inches. The need, however, has been for a machine to lift the material the first 15 inches, as it is a well known fact that once get the material onto a conveyor and you can carry it where you will. This is what has been

Automatic Loading Machine.

Height, 7 ft. 10 in.; clearance under discharge, 4 ft. 9 in.; width, 5 ft. 6 in.; weight, 4½ tons.  
1—Propelling Lever. 2—Main Clutch Lever. 3—Steering Lever. 4—Hand Wheel for Raising Front of Machine. 5—Reversing Lever. 6—Main Clutch Casing. 7—Propelling Clutch Casing. 8—Starting Box. 9—Circuit Breaker.

accomplished by the Park automatic loader, the principle of which will be readily seen from the accompanying pictures taken of one of their machines at work in the Illinois Steel Yards at South Chicago. One of them shows the machine, with buggy carrier

Automatic Loading Machine.

attached, at work against a pile of Mesaba iron ore loading the same into a buggy; the other shows the operating side of the machine, showing the different levers. The machine is automatic, so that the operator can move it back or ahead at will, or turn it end for end in its own length when on traction wheels. The machine can also be mounted on flange wheels. The machine eats its own way into the material and does away with any shoveling. I may say in the handling of this iron ore the machine has given perfect satisfaction, and this is considered most difficult material to handle. The machine has also been tested in the handling of coal, limestone and salt, all of which it has handled with success and at a saving of time and money.

Few outside the mining world know what this means. To a man who has a tunnel to drive it takes as long to clean up a blast after machine drills as it did to put in the holes; the same work with this machine can be done just as fast as they can get cars to it. This means that the blast can be cleaned up between shifts which will allow the drillers to

set up their machine in a clean face and in this way be drilling, when they would under the old way be shoveling back and getting ready to set up, and in this way break from 15% to 25% more ground to the shift. The capacity of this machine in the handling of material approximates 3 yards per minute.

MINE MANAGER.

EXPERIMENTS carried out by Moissan and O'Farrelly, with the aid of the electric furnace, show that the usual laws of distillation apply as well to the distillation of mixtures of metals, says the Comptes Rendus. Various mixtures were heated in the furnace for different times, and the residues were analyzed. In the case of copper and zinc and copper and cadmium, the zinc and cadmium were completely expelled after short periods of distillation. In the case of copper and lead, the same result was reached, after longer distillation, during which the percentage of lead gradually lessened. In the case of copper and tin, some mixtures gradually increased in copper content, some in tin content, and others distilled without change of composition. With mixtures of lead and tin, the lead gradually decreased until pure tin remained. A remarkable character of tin is the wide range of temperature through which the metal remains liquid; while it melts at 226° C., its boiling point is above that of copper and lead.

### A Traveling Machine Shop.

Some time ago appeared herein a description of the repair ship Vulcan, which did such good service for the American navy. The same idea appertaining to the land has been suggested, being as applicable to the land as the itinerant repair auxiliary was to the sea.

This idea has been successfully worked out in a practical way by the Morgan Construction Co. of Worcester, Mass., in the use of a freight car suitably equipped for a portable machine shop. In erecting rolling mill plants it has often been found necessary to have on the ground several machine tools and means for operation with which to do some small jobs of fitting and operation, which cause considerable delay if the parts have to be sent to a machine shop. The expense of installing tools and the depreciation on account of exposure was excessive. The machine shop car has proved to be an economy. It is sent to a plant whenever the erection is to begin and remains there on a siding ready for use until the work has been finished, when it is sent on wherever required.

The car itself is an 80,000-pound capacity box car, standard inside dimensions 8 feet 6 inches by 36 feet, and was made by the Laconia Car Co. of Laconia, N. H. It was fitted up entirely by the Morgan Construction Co.

In Fig. 1 it will be observed that the windows are partially imbedded in the sides of the car. This was

Fig. 1.

done that the wooden sections might be replaced over the windows as protection for the glass while the car is in transit or not in use.

Fig. 2 shows the inside of the car looking toward the end containing the machinery. The motive power

Fig. 2.

Fig. 3.

is supplied by an 8 H. P. gasoline engine. One of the difficulties of using a gasoline engine in such a small place, where a forge and combustible material would often be used, was to locate the gasoline supply tank where there would be no danger of explosion. This was overcome by bolting the 74-gallon gasoline supply tank underneath the car. For cooling the engine cylinder a 300-gallon water tank was placed inside

the car, as seen in the right hand corner of Fig. 2. The exhaust muffler is bolted underneath the car. The engine is connected to the shaft by a belt running on a clutch pulley, so that the power may be shut off at any time without stopping the engine. The main line of shafting is 1½ inch diameter, 15 feet 3 inches long.

The car is equipped with a 20-inch lathe, an 18-inch stroke shaper, an emery wheel grinder, a forge, anvil and good-sized work bench. It is also equipped with all the necessary auxiliary tools for these machines.

The car is so wired that it may be lighted by electricity the current being taken from the nearest point where electricity is available. Acetylene lamps are provided for use when electricity is not to be had. Steam pipes for heating are run along the side of the car, the steam also being taken from the nearest convenient supply.

Fig. 3 shows a view of the end of the car, in which a section has been reserved as an office for the superintendent of erection. In this office are a roll top desk, a chair and a cabinet, where blue prints and drawings are filed. A sink and toilet case with mirror complete the equipment. There can also be seen at this end of the car a rack where tools, bolts and supplies are kept.

This car is entirely complete with all necessary tools, lubricants, supplies and all ordinary items that a machine shop is likely to require.

It has been found of practical value in field work, saving the superintendent of erection time, trouble and traveling when machine work is required without delay.

### An Ore Testing Plant.

Of recent years progress in metallurgical knowledge and in the number and diversity of processes has been so rapid that if the ore of a given mine cannot be profitably handled by one method the mine need not necessarily be closed. If a given method fails, experiments may show that some other process is suitable. It is not always practicable to have at each mine a laboratory equipped to make tests of the various processes on a commercial scale. The accompanying engraving shows a mill and cyanide plant arranged to test ores in quantities up to carload lots and over. It has three 350-pound stamps, with a quadruple discharge mortar. For the majority of tests, however, all these screen openings are closed but the front one. The battery frame is of steel. The ore to be treated is hauled to the floor of the mill, on the left of the portion shown in the cut, weighed, shoveled into a jaw crusher, and then elevated by bucket conveyor to the ore bin.

After the pulp has passed over the silver-plated amalgamating plate, and over the 4-foot Frue vanner, if cyanidation is to be tried, it is pumped by a small centrifugal, at the lower end of the vanner, to three cone classifiers above the cyanide tanks. The classifiers are so arranged that the upper one is a settler, while the two lower ones may be used as spitzlute or simply as settlers. The slimes overflowing from the classifiers go to an agitation tank and the sands to percolation tanks. There are two of the latter, each of three tons capacity, and arranged with overflow to the sewer. A sump tank is above those for percolation. Besides the belt machine, there is a Wilfley table (about 4 feet long) for concentration tests.

A 7½ H. P. electric motor (on left of picture) is used to drive the mill, and there is a separate 2½ H. P. motor to run two sample crushers and a small jig. The jig is equipped so that the speed and stroke may be varied. There is a gas-heated oven, containing a series of shelves, for drying samples for assaying. All assays are made at the company's office, but sizing and percolation tests are made at the mill laboratory. It is proposed to add to the equipment a hand reverberatory furnace of 500 to 700 pounds capacity. A branch line of the Belt Railroad has a side track within 300 feet of the mill, so that ore for testing can be shipped in quantities up to and including carload lots. From tests made with such a mill, not only the most economical method of treatment can be determined, but also capacity

and cost of treatment for larger plants may be calculated. It is better to spend even a few hundred dollars for working tests than several thousand for what may prove useless. The plant shown is that of the Cal. Ore Testing Works, A. A. Hanks and F. L. Bosqui owners, with offices at 531 California St., San Francisco, Cal.

### The Dependence of Copper Mines on Electricity.

The huge changes taking place in the West owe their inception to the origin and development of great industries, among which none figure so prominently as agriculture and mining, says Electricity. It is many years since the first gold was discovered in California or the first copper in Colorado, yet it may be noted that the swift changes occurring, which swept out of existence the old order of things—the wilderness, the roving tribes of marauding Indians and all that pertained to a primitive civilization—were inaugurated by the systematic and scientific development of the great mining industries, and among these colossal industries none occupy so prominent a place as that of copper mining.

It is not too much to say, when we claim that copper mining, in order to be an economical and not a wasteful process, calls for the application of electricity for the refinement of the ore. In the great mountain ranges of the West many opportunities for the development of water power exist, and this power is frequently utilized for the operating of mining machinery, electric lighting, haulage, and the ultimate reduction of the crude copper into metal of the purest quality.

On the other hand, if water power is not available it more than pays to install engines and generators, as it has been shown in the operation of at least one mine in particular, the great Anaconda, that the use of electricity is indispensable to its successful working. To cite this mine as an illustration is profoundly interesting as regards the facts at hand. The Anaconda mine was formerly operated according to the old methods, with the result that the waste was very great in a financial sense. Copper is a metal which is subject to rapid changes during the purely metallurgical processes of purification, and for that reason the by-products are heavy. It was decided to try the electro-chemical method of reduction and in the course of time huge vats were built, generators were installed, and great blocks of crude copper were treated by this method. The result was beyond the expectation of the engineers, as great masses of electrolytically pure copper were found deposited at the cathode, and all that remained was a mass of sludge at the bottom of the vats. This mud-like substance for quite a period of time was thrown away, until one of the chemists decided to analyze its constituents. He found to his surprise that it consisted of a heavy percentage of silver and some gold. In the operation of the Anaconda mine to-day it has been stated that this in itself pays nearly all the operating expenses. As a matter of finance little else need be said in favor of the use of electricity in copper mining if under such circumstances all the copper obtained can be regarded as pure profit.

CONCERNING the breaking of a hoisting rope at the Aldworke colliery, by which seven men were killed, the Colliery Guardian says that the rope had been inspected the day before, and about half an hour before the accident had been tested by hoisting loaded cars twice up and down the shaft. The rope showed no sign of internal corrosion at the point of fracture, the separate strands being well protected

Mill of the California Ore Testing Works, San Francisco, Cal.

by tar. The actual breaking strain of the rope was found to vary from 15.5 to 44 tons (the breaking strain of a new rope should have been 56 tons), and the load weighed 4 tons, whereas the total weight at the point of fracture, due to rope, cage and men, was less than 3.5 tons. The rope had, from some cause or other, so deteriorated that, while to all appearances sound, it became liable to fracture under any sudden stress. Probably a large number of such accidents are due to the sudden application of the brake when the cage is falling rapidly. In Belgium, where there have been but six cases of broken hoisting ropes in ten years, the permissible working load is not allowed to exceed one-tenth of the breaking strain of the rope when new, unless the length of 2 meters cut off every three months shows that the breaking strain has not been reduced over one-third.

## Stamp Milling Practice in Nova Scotia.\*

NUMBER II—CONCLUDED.

Written by M. R. O'SHAUGHNESSY.

Another favorable feature in connection with the condition of the mortar as above described is in regard to the quicksilver, the principal agent in the recovery of the finer particles of gold. There is no danger of creating losses through an overabundant use of mercury when the mill is running under thin feed and the pulp is being displaced and washed 2 inches below the surface of the dies.

The moving pulp will suspend, or keep suspended, for a limited period of time the mercury so supplied, whether in small or large quantities, and whatever particles of gold mingled with the pulp are in like manner under suspension, will have an opportunity to become amalgamated with the mercury, if previous to the association the specific gravity of the particles of gold was sufficient for it to take a suspended position against the mechanical displacing or discharging wash of the mortar. Such particles of amalgam once settling or sinking below the crushing surface of the dies will be retained on the base of the mortar by the affinity of other larger or smaller deposits of amalgam or mercury, as the case may be, and by the specific gravity that has already been the chief factor in arresting the gold from being discharged after liberation from the ore. But too often, through carelessness or ignorance of the millman, the period of crushing is prolonged without a cleanup until the crushing surfaces of the dies have worn down to the deposits of amalgam and mercury collected between the dies and the values are churned out as the run is continued. By the method here described the millman will recover probably 70% of the deposits and find the same adhering to coreholes and rough surfaces in stamps, shoes and dies, screen frames and any rough surface that the pulverized amalgam may come in contact with inside the mortar; and lastly a large percentage adhering to plates outside the mortar. A portion of the loss may be recovered on concentrators.

Another common method of increasing the wear and tear of gold and the losses is to start with the mortar running in a choked condition, either from too high fronts, insufficient water supply, or by supplying ore to the mortar in quantities and at periods that do not allow the water to reach the crushing surface of the dies. Under this method of milling or starting a mill run, it takes but a few hours to stem or thoroughly pack the mortar to the surface of the die with the pulverized material in such a manner that nothing will remove it but bar and pick on cleanup day. In this condition of the mortar, What is the result when coarse granular gold is liberated from the ore? The activity or the discharging force of the mortar is not capable of removing it immediately out of harm's way; and if it were, the screens would not allow the gold to escape in its granular or coarser form. If inside plates are used it has to become amalgamated before it will adhere to them, and if bulky and having sharp angles the wash of the mortar will not allow it to remain on the plates until some of its sharp corners become worn off. If mercury is supplied in larger quantity than the gold being liberated will take up, it will settle to the base (in this case the crushing surface of the dies); and if the quantity of mercury supplied happens to be much in excess of amount required, its presence on the surface of the dies forms slush amalgam. This slush amalgam resting on the crushing surface of the dies holds with a subtle grip small and coarse gold alike, to be thoroughly pulverized before being discharged or lodged on the inside plates. If, on the other hand, we do supply sufficient mercury to a mortar running under conditions to meet the requirements of the gold being liberated, we run the risk of the gold being pulverized or beaten into minute, thin sheets that will not combine with the mercury, and that will eventually escape unamalgamated.

In my opinion, the millman that can judge the happy medium in supplying mercury to the mortar run in conditions as above described, is not very much in evidence in our mining camps. In my practice I have found the light mill will give best satisfaction by operating with medium fronts, fine screens, and abundance of water, thin feed, frequent beating out of the mortar, and by avoiding too prolonged a run without a partial cleanup. In all cases

I speed the mill to its limit with a reasonable drop of stamp, and depend on gravitation for the protection of the values when liberated from the ore. Twelve years of my twenty years' milling practice were spent before the light stamps, milling ores ranging from \$1 to \$2000 per ton, and when the mill was operating continuously, one shift under my personal supervision, I never entertained any apprehension as to the result on cleanup days. In my practice I have always found the light mill give splendid results as a gold saver and collector, when operated by methods that I have described in part as above.

I must admit that the modern mill is undoubtedly an improvement on the light mill when considered as a pulverizer of ore, and had our mining men confined the mill to the pulverization of the ore by a system of rapid, coarse crushing, and depended on secondary treatment for the recovery of the values in gold, a system or method of milling could be put in practice whereby the milling capacity of our mills could be almost doubled, and conditions under which losses may now occur avoided.

At the time of the introduction of the modern mill into our mining camps, men and owners made a general movement to retard the crushing capacity of the mill, practically defeating the very end they were seeking. In the first place they got the idea that the rapid high speed of the mill brought about the expulsion of the gold before mortar amalgamation had taken place; thus they jeopardized the chances of recovering values on the outside plates. To remedy this trouble, coupled with a great many more imaginary difficulties, they reduced the speed of the mill, in some cases from 20% to 30%, never thinking for a moment that in so doing they were practically checking the displacement of the pulp from one die to another and choking the mortar unless the greatest precaution was exercised in feeding the ore. The reason for this condition of the mortar in the modern mill when speed is reduced is the difference of design in the cam of the improved mill compared with the cam of the old type of mill. For example, the period of rest of stamp on the dies in the old mill, dropping 8 inches and making sixty drops per minute, is about equal to the modern mill dropping 6 inches and making 110 drops per minute. It will be apparent that in order to ensure satisfactory displacement of material under the stamps and to enable sufficient water to reach the crushing surface of the dies, especially in mills equipped with the usual methods of supplying water to the mortar, the stamp should be lifted the moment the descending stamp has been retarded by the material on the dies and the slowing down of the improved mill is a serious mistake. It not only deadens the activity of the pulp in the mortar and retards the crushing capacity of the mill, but where slate is present throughout the ore it also brings about a pasty, mucky condition of the pulp on the surface of the dies, due in a great measure to an insufficient supply of water to wash out the disintegrated material after each thrust of the stamp.

Mortars running under such conditions practically stem or pack solidly all recesses between the dies, and the crushing surface of the dies forms the interior base of the mortars. In such cases where a sufficient quantity of water fails to reach the crushing surface of the dies it matters little what the interior form of the mortar is, for the pulp itself will build up a design of solidly packed sand, converting the interior design above the surface of the dies into what resembles very much a farmer's dug-out pig trough, and in such a trough a good share of our Nova Scotian gold-bearing ores have been pulverized since the introduction of the modern heavy mill.

High discharge and fine screens have been used to prevent the gold escaping from the mortar. High fronts and fine screens are conducive to fine grinding, and no doubt liberate a large percentage of gold that would otherwise escape in low fronts and coarse screens. When, however, you increase the height of your fronts and use closer screens, you also increase the difficulty of having a sufficient supply of water reach the crushing surfaces of the dies, so essential to the protection of the coarse particles of gold so common in our ores. The question is before me at all times, Do we, by raising the discharge and using finer screens and subjecting all the gold values to the pulverization action of the stamp during the period of the run before the cleanup is made, lose in float gold an equivalent in values equal to what we liberate by fine grinding?

The first difficulty that I encountered in the improved mill was the protection of values after being liberated from the ore. This difficulty was chiefly due to stemming and packing of the sands between the dies, which, without constant attention to the feeders in use, I could not avoid.

With this difficulty continuously before me in operating the modern mill of the Tudor Gold Mining Co. at Waverley during the summer of 1895, I conceived the idea of putting in some form of agitator to continuously disturb the sand between the dies in such a manner that any atoms of the ore having extra gravity would readily find a safe place from the action of the stamps and the severe abrasion of sand.

I decided that the water usually dropped or directed into the mortar on top of the pulp, if directed into the mortar by means of a series of small jets or nozzles at any desired point below the

crushing surface of the dies, would bring about the desired agitating result, supplying a mechanical agency whereby I could be assured that at every stage of the mill-run all coarse particles of the gold would be recovered without the agency of mercury, and that a sufficient quantity of clear water was being directed on to the surface of the dies to wash out the disintegrated particles after each thrust of a stamp.

I have also found that under any condition of feed, height of fronts, or fineness of screens, the water directed under pressure, as herein described and shown in the accompanying illustration, will at all

times during the run of the mill keep the recess between the dies so freely agitated that battery iron, nails, and gold in small or coarse particles readily become deposited between the dies, and if any reasonable attention is given to the supply of ore to the mortar there will be found little or no difficulty in keeping the wearing surface of the dies and the stamp shoes perfectly square or level. I maintain that the capacity of the mortar is also increased because of the presence of clear water directed into the pulverized material immediately after the thrust of each stamp. By this system of water supply, the material under the stamp, while being displaced alternately from one die to another, has to pass through or take with it a fountain of clear water. Hence, it should be apparent to every practical man that the heavier ore will readily sink into recesses between and around the dies.

As an example of what can be done in a mortar supplied with water directed under pressure as herein described, the following may be of interest: During the month of November, 1900, I superintended at Renfrew the Thompson cleanup of 2700 ounces of gold bullion and made a practical test of one battery of five stamps, dropping 5 inches and making 110 drops per minute, with 6-inch fronts and No. 37-mesh screens. From one run of an hour and twenty minutes on specimens, I received one bar of gold bullion weighing 666 ounces. Of this amount 95% was recovered below the crushing surfaces of the dies, about 2½% was attached to the interior of the screens, and the balance of 2½% was on the outside plates. The run was witnessed by three men besides myself, and I consider the run practically showed the thorough protection coarse grains or even small particles of gold get in a mortar supplied with water directed under pressure below and between the crushing surface of the dies. In the majority of cases where the tailings of mills are not subjected to a secondary treatment to recover values lost by coarse crushing, I contend that by applying the water as herein described, the stamps could be allowed to reduce the ore to a slime, and yet not injure the values in gold; and when cleanup day came, the gold would (with the exception of a very small percentage which fine grinding had liberated and discharged on the outside plates) be found deposited between the dies in particles still having their sharp angles, and as free from wear as when first liberated from the ore.

The proceedings to obtain patent to placer claims are similar to those required in making application for patent to lode claims. The price at which the Government sells placer ground to the patentee is \$2.50 per acre or fractional part thereof. Where the placer claim conforms to the line of Government land survey, no resurvey is necessary. Subdivisions to ten acres may be followed.

\*Abstract Trans. Min. Soc. of Nova Scotia.

# Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE  
MINING AND SCIENTIFIC PRESS.

The copper production of the United States for the calendar year 1903 has been issued by the United States Geological Survey, showing the following figures:

Source.	Pounds.

Total (including copper from imported pyrites) 730,041,517  
a Copper smelters in Colorado, buying argentiferous copper ores and matte in open market, sources not known. The quantity of Montana matte which goes to one of these works has been deducted.  
b The quantity stated covers only that part of the incidental copper product the source of which could not be ascertained.  
c Estimated.

## ALASKA.

A. Gfeller at Windham bay, near Juneau, reports development work in full progress at the Little Basin group. A compressor plant has been set up.

The Portland Reduction Co., owner of the Monumental mine in Grant county, Or., is developing a copper group on Prince Edward island, 30 miles from Ketchikan. The work is progressing, says C. J. Allen, president and manager.

## ARIZONA.

### Gila County.

Near Globe the Copper Bell M. Co., W. Kemp, manager, is excavating for a 250-ton smelter. The present smelter is treating forty-five tons of ore per day and the matte is shipped to Globe. There is also being shipped thirty tons of sulphide ore to Globe daily. At 120 feet in depth it is stated the vein is 16 feet wide, which averages 8% copper, 8 ounces silver and \$2 gold per ton.

The new smelter of the Old Dominion C. M. & S. Co. at Globe in its initial run is giving satisfactory results, says the Silver Belt. The amount of ore put through No. 1 furnace has been increased, until twenty-four hours' run takes 450 tons and the daily output of copper bars is 25 tons. No. 2 furnace has been blown in. Improvements are being made in the method of making up ore charges and making delivery to the furnaces more rapid. There is still a large number of men at work on construction in and about the smelter. Two 7-foot Chili mills and rock bins for the same are being placed. Grading is not finished as yet. On the sidehill above the smelter double tracks are being put in to hold thirty cars of ore and coke, as a reserve in addition to the supplies carried in the smelter bins, which have a capacity of 2000 tons. Another standard gauge locomotive is in use. Arrivals of coke have increased, the storage bins below the smelter are full, and there is a large amount of coke piled up outside the bins. It is intended to keep these bins and the adjoining ones for sulphide ores filled up, so that in the event of interruption to traffic there would be a two months' supply of fuel and sulphides on hand. Work in other departments shows progress.

### Mohave County.

J. W. Moore of Philadelphia, Pa., president and manager of the Golden Star M. Co., operating near Kingman, states that a road is being graded into the mines of the company, a few miles north of the Moss mine. Machinery will be put in and work on the mines started. The mine shows veins carrying milling values in gold.

Work on the Midnight mine at Chloride is to be resumed; shipments will be made to the smelter.

### Yavapai County.

The Equator smelter at Jerome has been changed from a coal to an oil burner and is said to be giving satisfaction.

The 85 H. P. gasoline engine for the Rincon G. M. Co., near Martinez, has been put in place. The Alaska mine will be worked with an increased number of men. An engine and other machinery are being set up and twenty additional miners will be put at work getting out ore, which will be treated at the mills of the Congress Con. M. Co. An office has been opened at Congress. G. Margueritch has bought

the Rocky Mountain mine, in Black Rock district, the price being given at \$25,000.

At Prescott the Metals M. Co. has been formed to operate mines at Walker. The officers are G. W. Middleton of Prescott, president and manager; J. C. Moore, F. H. Adler and T. G. Norris.

Manager J. S. Johns of the Little Jesse mine, near Prescott, says 7 miles of pipe line will be laid from DeLarge ranch to the Little Jesse mine. The line will be of 6-inch pipe. At the water supply point will also be built an electric plant. The water will be pumped 4½ miles and will flow the remainder of the distance by gravity. The lift is 1100 feet. It is also intended to construct water storage reservoirs in the mountains.

The Val Verde smelting plant at Val Verde, on the line of the Prescott & Eastern Railroad, destroyed by fire recently, is being rebuilt under supervision of S. E. Bretherton of the Bradshaw Mt. C. M. & S. Co., which owns it. There is a 250-ton smelter on the road that will be set up and in operation by December 15. The building for the smelter will be up and ready to receive the machinery on its arrival. The smelter will be set at south part of the building and additional furnaces will be put in to the north. It is intended to put up a plant with capacity for smelting 500 tons of ore per day. At present the company is buying ore and piling it on the ground and in bins ready for smelting when the machinery is in. The Val Verde water supply is said to be ample for all smelting and reduction purposes the year around. It is intention of the company to make a dam of slag dumped into the bed of the stream as the slag comes from the smelter. By making a slag dam the water can be raised about 90 feet, and a lake formed nearly ½ mile long and from 40 to 80 feet deep. The water thus saved would furnish a supply for neighboring mills as well as for the smelter, says Superintendent Bretherton.

H. L. Hall, who bought the Buster group of mines, near Prescott, is starting operations and will put on thirty miners in the stopes before November 1. C. Humphries, who has bought the extension of the Blair mine in Crook canyon, has started work. It is said he will arrange with the Cash mine to mill his ore until he can erect a mill of his own. The ore carries free gold.

## ARKANSAS.

### Marion County.

Yellville reports say three more producing zinc mines will be added to the Marion county list. The track of the Missouri Pacific Railroad will be laid to near the Iola, Susquehanna and Nakomis mines, which are ready to ship ore. To these will be added the Broome mine, near the group, which is being prepared for production.

## CALIFORNIA.

### Amador County.

W. E. Stewart, superintendent of the Jose Gulch M. Co., near Jackson, says operations are progressing favorably. Repairs to the mill are about completed, new plates have been put in, and it is expected to start up by Nov. 1st. The company owns 172 acres of ground, extending from Jose gulch to Butte City, a portion of which will be worked by hydraulic process, 6500 feet of pipe having been ordered to put water on top of Red hill. The mill contains ten stamps.

### Butte County.

The Viloro Syndicate, Ltd., of London, Eng., which took over the McGee ranch of 200 acres, 2½ miles south of Oroville, expect their Bucyrus dredger to be fully completed and working by November 1. From sixty-three holes drilled, the average depth to bedrock was found to be 31½ feet, giving 50,000 cubic yards of earth to the acre. The values discovered from these tests proved satisfactory. Walter McDermott, managing director of Fraser-Chalmers, London, England, is chairman of the syndicate; T. H. Leggett, general manager; W. H. James, Oroville, superintendent of dredger operations.

### Calaveras County.

The Madison mill of the Utica G. M. Co. at Angels is closed for repairs. The ore bins of the cross shaft and the Stickle mill are also undergoing repairs. The Utica Co. will also begin work of repairing the flames and ditches.

### El Dorado County.

Development work will be resumed on the Josephine mine at Josephine. It is reported the New Highland G. & C. M. Co. will resume operations on its mines in and near Georgetown. The dam at the Cash Rock mine on the American river, near Josephine, has been washed out and the flumes swept away. It is thought repairs cannot be made in time to resume operations this season.

A. N. Buchanan, who is opening up the

Smith Point or Zantgraf extension, near Loomis, Placer county, says he has run several hundred feet of tunnel. The ore averages well in a milling test. A shaft will later be sunk and a hoist and mill put up.

E. Silknitter reports he has bonded his North Extension of the Last Chance mine, near Placerville, to a Los Angeles company, and a mill will be built. His river claim in Coloma has been bonded to W. C. Bell of Kelsey, who will put a dredger in operation.

### Inyo County.

(Special Correspondence).—Cohen & De Lamar are developing the property bonded by them last May in the Funeral mountains, with encouraging results. This is the strike made by Kean and Etcharren on the east side of Death valley and known as Kean's Wonder. It is 80 miles northeast of Ballarat. In July another strike on an extension of the Wonder was made, and 17 miles northwest of that Harris & Cross report a strike in the Bullfrog mine.

Near the Republican mine is the Radcliffe mine. W. G. Macomber has a roaster which he is setting up on the property to work the refractory ore. There is a 20-stamp mill on the mine.

Seven miles from Ballarat in Pleasant valley the Republican M. Co., Superintendent G. E. Little, is working twenty-three men and milling fifteen tons of \$100 rock per day. The process is roller mill and plating, the tailings being held for future treatment. This is a southern California company, G. Montgomery of Whittier being the principal owner. It is intended to put in a stamp mill.

Considerable prospecting is being done in the Panamint range. It is likely to fall within the range of prospectors from the Goldfield, Nev., district. This section between the Clark road and Tonopah, Nev., and the Death Valley section is expected to receive more attention the coming season than ever before. Articles of incorporation have been filed at Independence for the extension of the railroad from Borate, now connected with Daggett, Cal., to Tonopah, Nev., by way of the Saline valley. This will go through the heart of a country hitherto almost prohibitive to the ordinary prospector, but generally conceded to be mineralized.

Darwin, 25 miles south of Keeler, is a silver camp, once operating three smelters, but deserted for several years past. There are indications that it may be reopened. The Lucky Jim mine is working a few men and the Coso mine has changed hands and will be operated again. Moss & Reck, the former owners, have been cyaniding the tailings. Other mines in the neighborhood are the Defiance, owned by the Reddy Estate; the Modoc, W. S. Gage; the Minnetta, J. J. Gunn; and the Lane mine.

F. L. Howard expects to build a stamp mill on his Star group, 20 miles south of Darwin. He has 900 feet of work done and stoping ground opened up.

Ballarat, Oct. 18.

(Special Correspondence).—The Kearsarge G. M. Co., T. F. Murray, superintendent and manager, has bought the Kearsarge mine, 12 miles west of Independence in the Sierra Nevada. The original values were silver and changed with depth to gold. The company will run a tunnel below the old workings, giving a total depth of 1000 feet below the apex and 400 feet below the old workings. A plant will be installed for treating the ore. An electric plant and power drills will be put in.

Independence, Oct. 18.

### Mono County.

Bodie reports say a strike has been made at Masonic mountain, 16 miles northwest of Bodie. A ledge 4 feet in width shows a 12-inch streak assaying \$300. Rich ore is being taken out at the surface and sacked for shipment. The discovery was made on Jump-Up-Joe claim, owned by Bryan, Dorsey & Phillips. The district has been organized and is connected with Bodie by wagon road. Claims are being staked out and the country is being located for several miles. The strike is ½ of a mile north of the mountain. The high altitude and severe climate will not allow much work until spring.

### Nevada County.

In the Ironclad mine, near Grass Valley, last week the bucket on the 8-inch pump broke, and before another pump could be put in place the water rose and the men were driven out of the mine. Superintendent McConnell says he will put in another plant of sufficient size to handle all the water which may be struck.

At Snowpoint, near Nevada City, the Santa Monica mine has been sold to E. Gregory & Co. of San Francisco which has had a bond on the property. Development work is in progress. The ledge is 2 feet wide and the rock goes \$10 per ton. The property is 5 miles from Relief hill.

In the spring the company will build a mill and put on more men.

Pumping out the lower workings of the Murchie mine is completed to the 700-foot level drift and men are opening up the ore bodies there. It is also stated the main shaft will be sunk 200 feet deeper. The main trouble seems to be to get expected results from the mill recently installed. It is said alterations will be made.

### Plumas County.

A. F. Eaton of San Jose, largely interested in the Tabor mine, in the Gibsonville ridge, and also interested in the Happy Hollow mine and adjacent properties in the Port Wine ridge, near Gibsonville, says the Tabor mine is working two 8-hour shifts in the face of the incline, which is in bedrock. They are under the gravel which was struck recently. There are sixteen men at work in the Happy Hollow mine and they will work all winter. Glinderman & Schofield are operating at the Swiftsure mine, 2 miles below Gibsonville. The Bunker Hill mine is working fifteen men, under management of J. K. O'Brien. The Bellevue mine, which had a fire on August 17th, has once more gotten everything under cover. The work of cutting down the tunnel floor to grade is progressing.

H. Kling at Gibsonville has taken charge of the Pilot Peak drift mine under an option and will increase development. The Pilot Peak is said to be on an extension of the channel running through Gibsonville ridge. Kling will have boreholes sunk on the channel to test its position and depth, after which a tunnel will be run from the Whiskey creek side of the ridge to tap the channel.

A San Jose company, with E. A. Hayes as president, has bought the Robinson mine in Granite basin, near Quincy, and will start development work.

### San Bernardino County.

(Special Correspondence).—The Yellow Aster M. Co. is working its 130 stamps to full capacity. The company still refuses recognition of the union and, though the latter is still strong in numbers, there is no open friction between the local union and the company.

The Adkinson Bros. have moved their 5-stamp mill from near Randsburg to their Sunshine mine, in the Stringer district, and are operating with satisfactory results. The Baltic mill, in the Stringer district, owned and operated by Wynne Bros., is running steadily.

The Red Dog mill at Johannesburg is running. A raise for air has been completed in the White mine and it will soon be on a producing basis. Development work on the Wedge mine continues to progress and it will be made a heavy producer. While there is no boom, steady progress is noticeable throughout the district.

Randsburg, Oct. 19.

### Santa Barbara County.

At Santa Maria, W. W. Orcutt of the Union Oil Co. reports he has secured a franchise for an oil pipe line right of way through San Luis Obispo county from near Santa Maria to Port Harford. The route has been surveyed and an 8-inch pipe will be used. The Union already has loading facilities at Port Harford for a large output of oil daily. At present the oil is shipped over the Pacific Coast Railway. This is the second oil pipe line franchise to be asked for through that section, the other being for the Arroyo Grande Co. The owners of two oil wells on the Lompoc anticline have struck oil. One of the wells is Lompoc No. 3, put down by a local company, the oil-bearing sand being struck at a depth of 3300 feet, and the drill is said to have pierced the sand to a depth of 100 feet, yielding twenty-four gravity oil. The other well is the Eefson well, the most western of the Lompoc group. This well was put down to a depth of 1500 feet, where a flow of 200 barrels a day was struck, but water worked into the casing, shutting the flow off. They sank deeper, and at depth of 2400 feet a second flow was struck. The well is yielding 1200 barrels daily.

### Sierra County.

P. Mason, superintendent of the Golden Scepter M. Co., operating a gravel mine near Bunker Hill, near Downville, says from five mine carloads of gravel washed two and one-half ounces of gold were cleaned up, an average of \$9 to the load. Preparations are being made to open the mine on a larger scale and twenty-five men will be put to work.

E. Westall of the New York mine, near Sierra City, has started work at the Marguerite mine. It has been shut down owing to more water than the pumps could handle. Heavier pumps are being put in.

### Siskiyou County.

At the Blue Ledge copper mines near the Oregon line, south of Jacksonville, Or., Superintendent G. W. Geddes reports

development progressing. It is expected they will take up their bond, build a smelter, and secure railroad connections for which a preliminary survey has been made from Jacksonville to Blue Ledge. The company also holds a bond on the Joe's Bar land on Elliott creek, where there is a location for a smelter and a town. Surveys have been made on Elliott creek and Joe creek to ascertain available power to be had for operating an electric power and light station. The current would be transmitted to the mines, 3 miles distant, where it would be used to operate a compressor and other machinery about the mine. Drilling in development work is being done by hand, but the company intends to put in a compressor and use power drills. Telephone connection will be established with Jacksonville. Superintendent Geddes has twenty-five men on the tunnels.

#### Tehama County.

(Special Correspondence).—The Basler M. & Dev. Co. mine, near Lowrey, is showing improvement as work progresses. The main tunnel cuts the limestone which is 210 feet wide. There are ore bodies 75 feet across on the hanging wall side of the limestone and 85 feet on foot wall of limestone. Drifts have been run near the hanging wall a distance of 200 feet and the copper values have increased from 7% at the adit to 18% at end of drifts, with gold and silver values. Near the foot wall a drift is in 50 feet and this will be extended 100 feet. The intention of the company is to run drifts both sides of the tunnel, also raises of from 100 to 200 feet at end of each drift.

Lowrey, Oct. 19.

#### Tuolumne County.

The electric power plant at Phoenix lake has started up again and power is available for all purposes. Many of the mines and mills that were compelled to suspend operations entirely or prosecute work in a limited way the past month are again in full operation, says the Sonora Democrat. The dry season this year has been short. The mountain dams of the water company are full.—The Moody mine at Big Oak Flat is being unwatered.

Work will be resumed on the Davis mine on the Trevithick place,  $\frac{1}{2}$  mile west of the Draper mine, near Soulsbyville, by Irish & Chandler, who propose to equip it with machinery.

#### Yuba County.

Near the site of the first two dredges on the Hallet farm, near Marysville, seventeen teams and scrapers are at work excavating a place 200 feet wide and 500 feet long where two more mining dredges will be built for the Hammon Co. Preparations are under way to build two dredges on north side for same company, and it is expected these six machines will be at work by next summer. A machine shop and additional boarding houses will be constructed. The two machines now operating are building up a double embankment between 20 to 30 feet high, one machine following the other and depositing its tailings alongside the embankment thrown up by the first one. The agreement with the Government calls for a single embankment, but after seeing the power of the Yuba river when the winter freshets come Hammon concluded to double the strength of the work. When completed, the Yuba river will have a wall over 20 feet high with a base of over 150 feet across the entire channel. It is expected this wall will turn the stream and cause the water to flow through the new cut-off. The expanse of river bottom back of the wall will form a large settling basin for future deposits of sand and gravel. This wall will be below the barrier being built by the Government and will be about 2 miles in length.

R. E. Cranston and W. C. Hendricks of Sacramento, who have been prospecting a tract of Yuba river land, near Marysville, have closed a deal for it. The tract contains 1200 acres and adjoins the Hammon tract on the north, west and south. The drills have shown it to carry workable deposits of gold, and two dredges will be placed on the property. They are expected to be in operation next spring.

A bond on the Albion Hill mine on the F. Hunt estate in East Bear River township, near Marysville, has been taken by Marysville and San Francisco men. There is a large body of quartz and low grade ore in Albion hill, and one of the first requirements is a tunnel to drain the mine. The Whitney quartz mine is 2 miles from the Albion Hill, and also is under bond and in course of development.

### COLORADO.

(Special Correspondence).—Business generally with the machinery and supply houses is reported not very active, although there has been a decided improvement the past month over the mid-summer months. The stagnation is traceable to the labor agitation, and now everybody is waiting for election to be

over. With but few exceptions, the mining camps are in a flourishing condition. Most of the men are busy who want to work and nearly all the mines are employing as many, if not more, men than heretofore. It is believed, when election is over, that there will be increase in the sales of machinery and supplies.

Colorado has secured several first prizes offered at the St. Louis Exhibition. The mining exhibit under the supervision of Commissioner of Mines E. L. White was awarded first prize. The exhibit sent from Colorado is valuable, as many of the specimens are almost pure gold and silver. The School of Mines at Golden has received word from St. Louis that it has been awarded the gold medal for its exhibit of practical metallurgical and chemical work conducted by the students under the supervision of some of the teachers.

Denver, Oct. 17.

#### Boulder County.

Tungsten ores are being produced in Nederland mining section of southern Boulder county, 4 miles north of Rollinsville. The owners of the Boulder county mine are putting in machinery and erecting a shaft building, work being in charge of F. W. Lake of Nederland. The mill at Nederland has been overhauled and it is running regularly on tungsten ores of fair grade. H. E. Woods is interested in the Graham lease and they have shipped three cars of tungsten ores to Denver.

#### Chaffee County.

The Manitou mine, in Hematite district, 10 miles northeast of Salida, has been bonded and leased to C. Johnson and J. W. Levon of Cripple Creek for \$50,000. Negotiations are also said to be pending whereby the Cripple Creek group and the Big Five mine will be transferred to Colorado Springs men.—A strike is reported made in Alder district, 20 miles southeast of Salida, showing a 5-foot ore body carrying gold, at a depth of 2000 feet, by the Spring Creek M. & M. Co.

L. Cavanaugh of the West Gold Hill M. Co. reports work progressing on that company's holdings in Taylor Park section, near Tin Cup. The company is erecting a cyanide mill and will have it in operation by Nov. 15.—The Woods G. M. & M. Co. is building a mill, the machinery for which is being hauled into the park by wagon from Buena Vista. It is hoped to have it in operation by December.

#### Clear Creek County.

Ore shipments from Idaho Springs mines for the nine months ended September 30 amounted to 1175 carloads. For the same period in 1903 the shipments were 898 carloads. Ten carloads of ore daily have been sent out so far this month, and Manager F. D. Wiley of the Chamberlain-Dillingham Ore Co. says shipments for October will exceed the shipments of any month in the history of the camp.

#### El Paso County.

J. D. Grant, manager of the Telluride mill at Colorado City, says they will reorganize the General Metals Co., pay off the indebtedness, improve the property and resume operations.

#### Fremont County.

Extension of the Santa Fe Railroad, being built from Rockvale to the mines being opened by the Victor Fuel Co., 7 miles south of Florence, is making headway. About 200 men are on construction work. This coal belt is known as Radiant and seventy-five men are constructing buildings for the town of Radiant. Near it three coal mines are being opened, each of which is expected to employ 500 men. Surveyors are locating site for the dumping station, the coal from the three mines to be dumped into the railroad cars at the same point.

#### Gilpin County.

J. H. Campbell of Russell Gulch has a two years' lease and bond on the Rover mine, in Russell district, south of the Saratoga group. The main shaft is down 320 feet and will be retimbered, as the mine has been idle for several years. Campbell owns two adjoining claims to the Rover. A plant of machinery and shaft buildings will be put up. The property was formerly wet, but the Newhouse tunnel is expected to drain it.—The United M. & Exp. Co. has finished putting in machinery and repairing buildings on the Modoc mine, on the "Patch," on Quartz hill, and will start sinking. The main shaft is down 180 feet and will be sunk below La Crosse tunnel level.

The Reed M. Co. has been organized to operate mines in Gilpin county by J. M. Champion et al. of Concordia, Kan. They have become interested in the Thompson and Bon Air mines, on Eureka gulch, west of the Nevada district, near Central City. The Thompson lode has been developed by a two-compartment shaft. In the bottom of the shaft there are 18 inches of quartz showing on the foot wall which gives average values of \$11 in gold,

30 ounces silver, with some lead. On the hanging wall there are 8 inches of quartz showing lead and iron sulphurets. It is intended to continue sinking the shaft and they have put up a temporary building and will put in hoisting machinery and a steam plant. W. J. Thompson of Nevada district, near Central City, is superintendent.

The Hampton Con. M. Co. reports that it will put in a plant of machinery at its Hampton mine at Russell Gulch. It will also arrange for shipments.—The Cashier G. M. Co., at Central City, will put in a larger hoisting plant and sink the main shaft, which is down 600 feet, says Manager B. Campbell. A large tonnage of smelting ores is being taken out.

It is reported that negotiations are pending for the sale of the Perigo mill, in Gambel gulch, near Perigo, to the Gold Dirt M. Co. It is equipped with thirty rapid-drop stamps. The Gold Dirt M. Co. will start it up on ores from the Gold Dirt mine, intending to run this winter at its present location, but next spring they expect to remove the mill to the tunnel entrance of the Gold Dirt property at a point lower down Gambel gulch.

Near Rollinsville, the Ideal G. M. Co. has resumed operations on Tip Top mountain on its group of three claims. In the spring they intend to put in a steam plant for deeper operations. The same company is interested in the Sunshine mine.—The Golden Sun M. & M. Co. has been incorporated. It owns and is operating a group of claims covering 200 acres on South Boulder creek, 3 miles west of Rollinsville. They have had men doing surface work all summer and have opened up ores, some of which carry \$3 to \$12 per ton. They have started a tunnel at foot of hill near the line of the Moffat Railroad. It is a double-track tunnel, 7x7 feet in the clear.

The Wilkes-Barre G. M. & M. Co. is continuing development work on its Baldwin group at Russell Gulch under management of J. F. Harrington. Drifting is being done in the 200 west level, while in the 325 east level the drifting has opened up 3 feet of vein matter which is being saved for milling. Crosscut has started south from the 325 east level. The work is being carried on from the Baldwin shaft, where there is a gasoline hoist. The company is also sinking on its Dark Horse lode. The company expects to build a plant for treatment of its low-grade ores.

Central City reports say shipments of smelting and other ores, concentrates and tailings to the smelters and other outside points during September amounted to 277 cars, or 5550 tons. This was the heaviest shipping month of the year, showing an increase over August of about 10%. The gain was due to the present low treatment charges offered by the American S. & R. Co. and by the Independent S. Co. operating in Golden. Increased tonnages are going to the local concentrators and stamp mills. The Spur Daisy mine is sending several loads per day from Negro hill to the Buell mill, which carry eight ounces gold per cord. The Eureka mine in Prosser gulch is also shipping regularly. Lessees have shipped several loads from the Kansas mine, on Quartz hill, which are reported to have given five ounces gold per cord. Parenteau & Co. have opened up ore on claims which they have leased in Quartz Valley district. These ores pan high and shipments will be made to the stamp mills.—Colorado and Eastern men have become interested in the Minnesota G. M. & M. Co., which has been incorporated by O. L. Beardsley, W. K. Gregory and A. S. Lamberton. The main office will be in Central City. The company has bought the Minnesota mining claim, south of Central. The shaft is being cleaned out.

#### Gunnison County.

(Special Correspondence).—The Raymond Con. M. Co. (see page 276) owns thirty-two claims in the Gold Brick district, on Ohio creek, 4 miles north of Ohio City. They are driving a 2000-foot tunnel to cut the Monte Carlo, Old Raymond and Midnight veins, which have been worked to a depth of about 300 feet from the surface, but on account of water had to be abandoned. The tunnel is in over 1300 feet and making an average of 8 feet per day. The work is being done with Norwalk compressor and Leyner drills. Several blind leads have been struck in the tunnel, some of which show values. As soon as the ore bodies are opened up the company will install a mill. The tunnel is lighted by electricity, the company owning its own plant. Little timbering is required in the tunnel. As soon as a shot has been fired steam is turned into the breast of the tunnel for several minutes, and then a blower is set in operation to purify the air. E. M. Lamont is manager and R. Hightower superintendent.

Adjoining the Raymond mines on the

north is the Gold Link mine, which is starting to drive a tunnel to cut the same veins as the Raymond Co. They are putting in a compressor plant and erecting bunk and boarding house. The tunnel is in 200 feet.

G. Brant of Pitkin is putting up a 10-stamp mill on the Golden Islet mine, in Jones gulch. The mill is about ready for operation and if it proves a success the plant will be enlarged.

Ohio City, Oct. 17.

The Big Comet mine, above the Citizen mine, near Pitkin, is being worked under lease and bond by the Columbia M. Co. of Washington, D. C., with R. Kahlow in charge. A vein of ore 5 feet wide, with a 14-inch pay streak on the hanging wall, carrying silver and copper, has been opened in the incline shaft.—F. W. Ferry and J. F. Murray have a lease and bond on the Bertha lode, in the gold belt, and have begun work. The tunnel is in 150 feet on the vein, which is 3 feet wide, assaying one ounce in gold.

#### Lake County.

At Leadville, Manager Goodwin of the New Monarch M. Co. says the company owns the New Monarch, Cleveland and Winnie claims, on Little Ellen hill, Evans gulch. A body of ore averaging \$10 per ton has been opened up for 1500 feet. It is 40 feet wide and 250 feet thick. The ore is too low grade to be shipped, but can be worked at a profit by milling, either concentrating or electrical separation. The company will build a mill.

W. A. Cunningham, at Twin Lakes, near Leadville, has put men to work on the Helen group of mines. The Helen group is owned by Chicago, Ill., parties. The group is 2½ miles from the lakes. A tunnel has been driven and will be continued.

Manager A. Boyd reports progress with development of the Fanchon mine on Sugar Loaf mountain, near Leadville. The shaft of the mine is on the mountain above Turquoise lake. Boyd is sinking it to the level of the proposed tunnel which he is preparing to drive from a point near the Colorado Midland tracks on northern slope of the mountain. The Fanchon is near the Dinero mine and the object is to extend the workings of the Fanchon to cut the Dinero vein, the extension of which is believed to pass through the Fanchon. Boyd has put in a plant of machinery.

#### Mineral County.

At Creede the Solomon and Ethel mines, on East Willow, which are being worked by Superintendent C. Loughridge, are preparing to sink the shaft to a depth of 500 or 600 feet and run drifts each 100 feet to ore, so that it can be stoped. They have put in a compressor. The Ethel mill, owned by the same company, produces high-grade zinc ore. An average of a day's run from the tables gave 61% zinc and 21% lead.—The Mollie S. mine, under management of R. S. Light, is shipping regularly, as they have put in a tramway from the mine to the road, so that the ore, which had to be packed with jacks and cost \$3 a ton to the cars, can now be loaded in the cars for 50 cents a ton, says Manager Light. Most of the ore from the Mollie S. is chloride of silver and high grade, carrying some copper and lead.

#### Park County.

At Tarryall, President Vanatta of the Apex C. Co. says ore bins are being built and more men will be put on stoping ore from the 12-foot vein, which assays 18% copper, \$3 gold and 10 ounces silver.—Manager Clancy of the Hayman G. M. Co. has operations under way on the Hayman mine, adjoining the Apex. The shaft is down 300 feet. He is putting in compressed air equipment and pumping machinery. The ore carries gold and copper.

#### San Miguel County.

The Black Bear M. Co., owning fourteen full claims, a millsite and water power in Ingram basin, near Telluride, reports development progressing. The south drift, which has been driven 600 feet from the intersection of the crosscut tunnel with the Argentine vein, is going ahead, showing values in gold. The vein is 8 feet in width. Within the next 100 feet the drift is expected to cut the Golden Crown cross lead. This vein is from 2 to 6 feet wide of brown quartz, free milling. No more ore will be sent out for treatment this fall, but the ore taken out in driving the drift and sinking the shaft will be piled on the dump for reduction next spring, when it is intended to build a stamp mill, a tramway and other improvements.

#### San Juan County.

At the power plant at the Gold King mill, near Silverton, a steam turbine which has a capacity of 315 H. P. is being put in. Eight jets of steam are conveyed to the cups of the wheel under pressure of 160 pounds. A small shaft 1 inch in diameter connects that wheel with an-

other set, from which the power is transmitted to two dynamos of 150 H. P. each. Engine, dynamos, etc., occupy a space of 8x10 feet. Steam will be generated by two marine boilers of 150 H. P. each. The power will be used to run the tailings plant, lately completed.

#### Summit County.

The Old Union M. & M. Co. is increasing work on Mineral hill, near Breckenridge. While mining is going ahead in the upper workings, where bodies of silver-lead-zinc ore are being blocked out, a contract to drive 250 feet on the tunnel has been let. Ground is broken and the foundation going in for a concentrating and separating mill in French gulch. The ore bodies developed through a shaft will be tapped at depth by a tunnel, and this tunnel will be driven during the winter months while the mill is under construction.

#### Teller County.

The Colorado Mica M. Co. has been organized by Duluth, Minn., men to operate mines in Teller and Fremont counties. J. A. Stetson, H. F. Rehbone, J. W. Harbison and C. H. Glover are directors. The company is operating properties near the Teller and Fremont county line, and is said to have opened up mica measuring 3 to 9 inches in width.

The Ajax Co., on Battle mountain, Cripple Creek, is working fifty men and the lessees about thirty. During September 600 tons of ore, average value \$30 a ton, were shipped. During October the value and tonnage will be increased, as new veins have been uncovered. Nearly all the ore being mined is from the seventh, ninth, tenth and twelfth levels. Besides this production, the company is doing development work.

The Cripple Creek Cyanide Co., whose plant is at Gillett, has started operations. While the company holds leases on several dumps in the district, they expect to treat a large tonnage from the mines around Gillett. The mill has a capacity of 100 tons per day.

Of the twenty sets of lessees operating on the Stratton's Independence, Ltd., mine at Independence, all are taking out ore, says the Cripple Creek Times, and they are shipping ten cars of ore per day. Among other mines shipping are the Golden Cycle, the Valley City, and the lessees on the Dead Pine. J. D. Fore, leasing on the Gregory of the Elkton Co., is sending out screenings that run ten ounces gold. The railroad officials say the tonnage now being hauled is heavier than it has been for several years.

### IDAHO.

#### Boise County.

Machinery and supplies are being taken in for the Dry Lakes group of quartz claims owned by L. Powell, and on which Green & Thompson of Spokane, Wash., hold an option. A chili mill, with capacity of fifty tons daily, will be put up, also a sawmill. The Dry Lakes claims are on the State wagon road, 4 miles from Banner, near Idaho City.

#### Custer County.

J. McGregor of Salt Lake City, Utah, operating mining interests at Bay Horse, says he has started development work. The properties are known as the Pacific group, operated by the Salmon River M. Co. Ore is being shipped.

#### Idaho County.

The owners of the Dewey mine are rebuilding the dam in south fork of Clearwater river, east of Grangeville. Nearly all of the dam was washed away by the high water last spring and the company has been waiting for low water before rebuilding. A 100-ton cyanide plant will be put in. Twelve men are at work.—At the Evergreen mine, 6 miles east of Grangeville, R. J. Howard et al. of Rosalia are working men and have 1000 feet of work done. On the Atlanta the tunnel is in 600 feet and has cut three ledges.

T. Parks says at Clearwater the Hawk-eye group, owned by Nez Perce men, is showing ore. They expect to put in a cyanide plant. They are running a 1000-foot tunnel on the group.

About sixty men are at work on the Sunnyside mine at Hump, putting in the 40-stamp mill, which will start next week.

—The Dewey mine is working thirty-five men and the mill is crushing ore steadily.—Twenty men are at work on the H. Y. group. Most of the work this summer has been on development, but a stamp mill is on the road and will be working this winter.

#### Shoshone County.

Work is being resumed at the Hunter mine at Mullan. The mill machinery has been overhauled.

At the Snowstorm mine, at Mullan, a compressor will be put in at the lower workings and a raise will be made to the up-

per workings. In the lower workings the ledge was tapped at a depth of 1072 feet. The upper workings are 400 feet deep. On the 400-foot level the ore body uncovered was 42 feet wide, which is claimed to run 8", in copper with gold values. It is expected the leaching plant will treat the low-grade ores at a profit. This plant is partly completed, but work is suspended. The lessees of the upper workings are shipping 160 tons of copper ore daily to smelters. About fifty men are working.

The Silver Star M. Co. has been incorporated by W. H. Batting, R. Stevenson, C. H. Maiden and W. J. Bracking of Wallace and E. Fleming and E. J. Flanagan of Mullan, to operate Coeur d'Alene mines.

Manager E. P. Spaulding of the Monarch M. Co. of Murray will build a concentrator of fifty tons daily capacity. The vein has been opened 350 feet deep, and development shows high-grade galena. While roads are in good condition it costs \$7 per ton to transport ore to the railway. During bad weather the cost is increased to \$10, says Spaulding.

The Reno-Idaho Con. M. & M. Co. has been incorporated by Spokane, Wash., men, including E. J. Dwyer, R. H. Voorhees, T. Ryan, C. Eckel and W. R. Newport. The company owns a group of claims on Military gulch, above Burke.

### MICHIGAN.

#### Keweenaw County.

The Kearsarge lode has been cut by the Allouez mine at Allouez, the lode having been tapped by a diamond drill. A shaft 1000 feet in depth and of 80° pitch reaches to within a short distance of the lode, says the Mining Record, but the final work was done by diamond drill, as the shaft must be continuous, and a curve is required to connect the 80° section above with the 40° section that will follow the dip of the lode. To start the curved section at the right point, it was necessary to locate the bed exactly before opening it. Several weeks will be required to complete the curved section and reach the lode with the shaft. The hoist for the Allouez is being built. Foundations are built for the engine, which has capacity to hoist six-ton loads from a depth of 6000 feet at a working speed of 2500 feet per minute and a test speed of double that limit. For milling facilities the Allouez will have one head at the Centennial mill.

#### Ontonagon County.

At Victoria, the Victoria mine reports progress in removal of the Belt mill to the Victoria millsite. The mill will go into commission about May, 1905. The mine is said to be sufficiently opened to begin production, and but little further work will be done underground until the mill is ready. Much work is in progress, however, on surface, both at the millsite, where foundations are being built for stamps and washing machinery, and at the power station, where 5000 H. P. from Glenn Falls of the West Branch of the Ontonagon river are being developed by means of a combination of dam, canal and shaft, by which the energy of the water will be transformed into compressed air, which will be piped to both mine and mill and made to operate machinery in same way that steam is used at other copper mines of the Lake district.

### MISSOURI.

#### Jasper County.

The Good Friday M. Co. at Joplin is sinking another shaft east of the old millsite. The superintendent expects to have his mill in operation by Dec. 15.—O. Baker, P. Burress, S. Smith et al. have leased thirty-six lots known as the Old June property on the Thousand Acre tract and have the water pumped out. Several sub-lessees have gone to work. There are two runs of ore, one at 60 feet and the other at 125.

C. D. Harris, J. Westcott, K. Bailey and C. Sallee have leased the Luke & Brown mine and mill No. 8 on the Keller land, south of Webb City, and are operating the same. They have opened up ore carrying lead and jack.—The South Portland mine is breaking into ore with its shaft and the dirt carries both lead and zinc in paying quantities. This shaft is said to differ from the usual in the sheet ore belt for the reason that the top of the sheet ore run carries rich dirt, whereas ordinarily the dirt is lean.

At Webb City the Fullerton M. Co. has leased the Blue Wing grounds and started operations.—The Opal Wonder M. Co., after being shut down for repairs, has resumed operations under management of C. B. Gammon of Carthage.—L. L. Harrington, W. Hall, et al., have begun operations at a prospect on the North Carterville ground. They run their ore through the custom mill.

### MONTANA.

#### Carbon County.

S. S. Glidden and Chicago, Ill., and

Minneapolis, Minn., men have bought all of the properties of the Bridger Improvement Co. and that of W. A. Clark in Bridger. Included in the properties are the Bridger coal mines, the townsite of Bridger, comprising 640 acres, and water power in the Clarks Fork river, estimated at 5000 H. P. It is intended to make improvements and a mill for handling of gypsum from the works near Bridger will be built with a capacity of 100 tons per day.

### NEVADA.

#### Humboldt County.

T. Trelfall of San Francisco, Cal., is reported to have bonded the Humboldt Queen and other mines, near Lovelock.

The Ohio-Nevada M. Co. of Salt Lake City, Utah, has been incorporated with L. V. McKesson as president; G. V. Parmelee, vice-president; W. G. Adamson of Salt Lake City, Utah, secretary and treasurer. The company owns a group of eight claims.

#### Lincoln County.

The North Star and the Talisman mining claims at the Point, 4 miles west of Pioche, bonded to C. E. Rives of Salt Lake City, Utah, have passed to the Pioche Con. M. Co., which Rives et al. of Utah have organized. Final payment has been made on the group. Several promising ore shoots are reported found on the claims, covering a length of 500 feet.

L. Syphus, of Panaca, reports getting out free gold and lead-copper ore from two groups of mines, the Marguerite and Winona, 18 miles south of St. Thomas, on the Virgin river, and about 50 miles from Moapa, on the San Pedro railroad. The groups are owned by L. Syphus with R. C. Lund, E. Brown and F. Burgess of St. George, Utah. They consist of sixteen claims and have fissure veins between granite and schist walls. There are 2 feet of ore assaying \$28 per ton. The quartz is honey-combed, carrying hematite and free gold. The lead-copper properties show 40% lead and values in copper. They have completed 300 feet of work. The lead-copper ledge is 4 feet between walls.

#### Washoe County.

The Electric M. & R. Co., which is between Reno and Sparks on the Southern Pacific railroad, has resumed operations after an idleness of two years. The plant is owned by H. D. Corey and L. Williams of Boston, Mass. They will start operations on 1000 tons of ore from the company's mines near Lovelock, in the Trinity and Arabia districts. The ore is free-milling gold and silver sulphides. The company has entered into a lease for two years with option of buying, with the Nevada M. & R. Co. of California, and on completion of the present run the mill will be turned over to that company. The lessees intend to install a leaching process for treatment of low-grade ore.

The Springfield-Nevada M. Co., at Olinghouse, near Wadsworth, has a large body of free milling ore with its ore bins and mill bins full. Superintendent J. D. Poole reports that the company will build more mills and take water in from Fort Defiance to enable them to treat at least 250 tons per day. The entire mill system will be changed and all mills consolidated at or near the mouth of Free Canyon.

### NEW MEXICO.

#### Colfax County.

A strike is reported from Elizabethtown, on the Hidden Treasure mine, owned by the Jetta G. M. & M. Co. A 3-foot vein was uncovered.

#### Grant County.

It is said funds to discharge all obligations of the American Con. C. Co. have been raised in addition to funds for building a treating plant at Lordsburg. Work will resume in the company's mines, near Lordsburg.

The 200-ton smelter at the Comanche M. & M. Co. at Silver City was completed October 15.

### OREGON.

#### Baker County.

Ten stamps are dropping at the Alpine mine, near Sumpter, says Superintendent Addoms. The mill is of twenty stamps and the second ten will be put in operation next week. The principal ore shoot opened is in the Alarm vein, showing a width of 7 feet of high-grade milling ore for 400 feet.

Gilkey & Kershaw, in the Greenhorn mountains, near Greenhorn, are putting in a 3-stamp mill on the Belmont mine. The group, comprising five claims, is on Vincent creek  $\frac{1}{2}$  mile from the company's placer ground. Three veins have been opened, one showing a width of 14 feet, assaying \$5.

The Lucy group, near Greenhorn, has been sold to the Greenhorn G. M. & Dev. Co. for \$10,000.—S. R. Stott and E. Sullivan of Sumpter, former owners of the

Lucy, will increase development on the Earle, which is a continuation of the Lucy. The drift on the vein is in 350 feet, giving a depth of 225 feet, showing a width of 22 feet with gold values.

Work has resumed on the Cracker-Oregon mine, near Sumpter. Work will be resumed in tunnel No. 2, which has been run 700 feet on the east vein, and it is expected a drive of 350 feet will reach the intersection of the east and west veins, giving backs of 450 feet, says Manager Bellman. Tunnels Nos. 1 and 3 have also opened up the east vein, the former being in 490 feet and the latter 600 feet. The vein is 3 to 5 feet in width. A shaft has been sunk to 100 feet and 350 feet of drifts and crosscuts run.

Manager Wright says Superintendent Allen has the shaft at the Black Butte down to the 145-foot level and a station cut. The mill of fifty tons daily capacity is in operation.

At the Friday mine, near Sumpter, J. F. Shelton, of the Sorensen Co., says the drifts are showing high-grade shipping ore from which the men are putting up 100 sacks daily, that will net, after all expenses of mining, transportation and smelting, \$100 per ton. Mill work has been temporarily suspended pending installation of jiggling plant.

The main tunnel driven on the ledge of the Hidden Treasure group, Greenhorn district, near Sumpter, is in 250 feet and will be extended to 400 feet, which will bring it beneath outcrop that showed a 12-foot vein of milling ore. The property is on Big Boulder creek and is owned by A. E. Dageny et al. of Portland. Dageny is also owner of the Co-operative group, 4 miles from Sumpter. He has put men to work in the crosscut tunnel and will extend it to the ledge. The crosscut is in 200 feet. Ore has been taken from the shaft sunk on the vein.

The Sterling mine, near Jacksonville, owned by H. Ankeny, V. and J. W. Cook, is ready for the winter run as soon as there is sufficient water. The ditch, 27 miles long, that brings in the water from Little Applegate, is cleaned out. Four giants will be used to wash down the gravel.

Near Sumpter the Huntington mill at the Columbia mine is set up. Five stamps of the old mill were removed, reducing the number to fifteen. The change is claimed to double the capacity of the plant. Ore is being taken out of Nos. 1, 2 and 3 tunnels, above the collar of the main shaft.

#### Columbia County.

W. W. O'Connor of Grants Pass says he will resume operations on his group of mines at St. Helens.

#### Douglas County.

At Bohemia, the 10-stamp mill of the Vesuvius mine has been put in operation. Ore is being broken in the stopes.

#### Grant County.

At Susanville the compressor plant for the Badger mine is completed. It consists of two 12x14-inch cylinders direct connected to a 10-foot Pelton water wheel running between them. The wheel takes water from a 14-inch pipe leading from a ditch giving a 240-foot head.—The Goldbug Co. has its hoist and head frame in place. A 40 H. P. boiler and a No. 6 pump are on the ground and sinking will be resumed.

#### Lane County.

A pumping plant is being built for the Lucky Boy mine, at Blue River, to raise water, after being used once in the batteries, for use again. All the stamps of the Lucky Boy have not been dropping, owing to a scarcity of water. Water has been developed in adjacent canyons, but the dry weather has caused the supply to be insufficient. Water is being developed in tunnel No. 6, or the main adit, for the leaching plant. The electric power with which the Lucky Boy is equipped will be used in pumping water back for second use. Such will have to be resorted to only in unusually dry seasons. The Lucky Boy is at an elevation of 3100 feet above sea level.

#### Josephine County.

The Southern Oregon M. & Dev. Co., composed of Portland men, is shaping its placer mine of Jump Off Joe district, near Grants Pass, for running this winter. The ditches have been cleaned and the flumes repaired, new piping laid and the whole property overhauled. The water supply will operate one giant night and day. The ground is an old channel, with banks from 5 to 20 feet deep, carrying values in coarse gold.

F. J. Catterlin et al. of Portland are making progress in development of the Bone of Contentment mine of Williams district, near Grants Pass. Over 700 feet of development work is done and a body of ore is uncovered for the mill.

The group of seven claims owned by the Almeda M. Co. of Portland is on Rogue river, 25 miles west of Grants Pass and about 3 miles below Galice Creek

postoffice. The ledge, 200 feet in width, strikes through the mountain nearly north and south, in slate formation, with diorite on the west. Rogue river, cutting through, exposes the entire width of the ledge. Covering the mineralized rock or ore body is an iron capping 40 feet in thickness. The lower tunnel which is developing the property is about 50 feet above Rogue river. This tunnel is in 275 feet and several crosscuts have been made which show the ledge 30 to 40 feet—all payable ore. The upper tunnel crosses the ledge 300 feet above and shows 30 feet of ore. The ore in lower tunnel assays from 1% to 8% copper and \$2 to \$10 in gold, while the upper tunnel ore gives values of \$7 per ton. South of this property the company owns two claims in a different formation and having low-grade ore. There are 160 feet of tunnel work; the lowest point is at 150 feet below the surface. The company intends building a road from the mine to Leland station, on Southern Pacific, a distance of 11 miles, with about 5% grade to overcome. The company proposes building a 200-ton smelting plant, which will be installed this winter. There are fifteen men at present on payroll of the Alameda mine. Headquarters are at Portland; O. M. Crouch, president; R. C. Kinney, secretary; J. F. Wickham (at the mine), manager.

## SOUTH DAKOTA.

### Custer County.

E. Collins of Fort Dodge, Iowa, part owner of the Mile High mine, near Custer, says work will be resumed.

### Lawrence County.

Lead reports say the Columbus Con. G. M. Co. has reorganized, with W. Saunty of Stillwater, Minn., as president.—The Quaker City G. M. Co. is working men on its mines in southern Lawrence county, south of Elk creek, near Roubais, running a tunnel and sinking. The company owns 1280 acres of ground, on which there is surface showing of ore.

The Spearfish G. M. & R. Co. for the month of September reports proceeds amounted to \$35,000. The ore was short of the tonnage treated in August, owing to interruptions. It reached 7500 tons. The ore carries from \$4 to \$5 a ton gold. In development work during the year the company has driven 7000 feet of drifts and heading. For the first five months of the year the mill was supplied entirely with ore taken out in course of development work. The plant is now receiving half its supply from development drifts and the other half from stopes. The main office of the company is at Colorado Springs, Colo., and the mines are in the Ragged Top section west of Lead.

The Bear Gulch G. M. & M. Co. and the Bear Gulch-Gold Hill Co. are reported preparing for consolidation. Their properties are adjoining in Bear gulch, west of Lead.

On the Victoria group in the siliceous ore district of Spearfish and Squaw creek, west of Lead, Superintendent Jackson says five shoots of ore from 6½ to 24 feet in width have been opened up. It is intended to build a 500-ton treatment plant. The company owns millsites and water rights on Squaw creek. Ore will be delivered to the mill by gravity.

The Clinton claim at Terry, owned by T. W. Thompson of Whitewood, is reported under bond to Eastern men. The Clinton adjoins the Buxton, owned by Lundberg, Dorr & Wilson.

The Ruby M. Co., operating at Galena, proposes sinking a shaft several hundred feet deep, to serve the double purpose of supplying water for the mill and exploitation of the ore bodies. The company expects to get water for mill operations either in that manner or by pumping from Bare Butte creek, a distance of ½ mile, and about 200 feet lower than the plant. The company also intends to increase the efficiency of its mill by adding a cyanide equipment. J. Z. Conzett is superintendent.

G. P. Baldwin, manager of the Eleventh Hour M. Co., near Deadwood, says he will build a milling plant at the mine. Work in the mine will begin Nov. 1st, and Superintendent Madill will get out logs and start a sawmill to cut lumber for the cyanide plant.

The Goldstake M. & M. Co., near Lead, will put in a plant of machinery to increase development, including a 10 H. P. gasoline engine, a dynamo and two electric drills. With this equipment the company will open up its mineral lands west of the Matland mine. There is a tunnel in on the ground 500 feet showing two low-grade veins. At 460 feet from the portal a winze connects with the surface, giving ventilation.

E. Hansckha, president of the Deadwood-Standard M. Co., operating in Ragged Top district, west of Lead, says development work is being done to open up a supply of high-grade ore to mix with the low-grade already opened up,

when milling will be resumed. Churn drills have been put in.

Fifteen more stamps have been put in operation at the Horseshoe mill, near Deadwood, making seventy-five stamps dropping. Good cleanups are being made, says Manager McLaughlin.

## TENNESSEE.

### Polk County.

The Tennessee C. Co. at Ducktown during 1903 produced 10,690,389 pounds of fine copper, compared with 8,103,534 pounds in 1902. A third furnace and a larger blowing engine have been built, which, says President J. P. Channing, will raise the output to 14,000,000 pounds. The company is increasing smelting equipment from three to six furnaces, and the capacity from 300,000 tons of ore per year to 600,000 tons. They are carrying out the plan of smelting "green" or unroasted sulphide ore, to reduce operating costs and increase extraction. Manager R. Adams in his annual report says there were hoisted from the Polk County mine 75,153 tons of ore, from the Burra Burra 120,046 tons, and from the London 92,266 tons, a total of 287,425 tons. Details of operating costs are given at:

Items.	Per Ton of Ore.	Per Lb. Copper.
Mine development.....	\$ 1343	0.36
Mining, hoisting, etc.....	6696	1.78
Crushing and sorting.....	0761	20
Railway.....	1454	38
Roasting.....	3500	88
Ore in process in roast yards.....	0442	12
Blast furnace.....	1 1437	3.04
Engineering and laboratory.....	0234	.09
General.....	1443	.18
Converting.....	2692	.72
Cost of fine copper in pig.....	\$2.9892	7.95
Refining.....	0971	.25
Cost of fine copper as ingot.....	\$3.0663	8.20

## UTAH.

### Utah County.

Superintendent N. Dunyon of the Scranton M. Co., near Eureka, in Tintic district, reports he is putting in a gasoline engine and a three-drill compressor.

The Utah mine of Fish Springs proposes sinking the main working shaft to the 1000-foot point. Superintendent C. Crismon says the ore bodies below the present lowest workings will be opened up. The mine has been operated only above water level and no pumps have been necessary, except the one employed to supply the engines and camp with water, which is obtained from a winze sunk from the 800-foot level.

### Piute County.

The Sevier Con. mill in Gold mountain mining district, near Marysvale, is in operation.

On Gold Mountain, near Marysvale, Manager P. A. Franklin of Salt Lake City of the Gold Dev. Co. reports opening up ore bodies in the tunnels, and a milling plant will be built.

### Salt Lake County.

To more economically handle its output and to increase tonnage that its enlarged smelter will require, the Tintic M. & Dev. Co. will equip the main tunnel by which its Yampa group of mines at Bingham is opened with an electric locomotive, says the Tribune. The tunnel is in 1 mile. With the enlargement of the smelter the locomotive will be required to handle at least 450 tons a day. The management is making raises and chutes, says Manager G. H. Robinson.

Sinking within the copper, gold and silver-bearing zone of the Utah Con. M. Co. at Bingham has been resumed after the installation of equipment, and the vein will be opened to a depth of 900 feet. The winze, says Manager Channing, will drop down with the foot wall and on the 900-foot level crosscutting will begin. On the 800-foot level the ore body shows a width of 150 feet between walls. The furnaces are reducing an average of 700 tons daily.

H. W. Crowther, manager of the Continental-Alta mines at Alta, reports work progressing at the mine and at Tanner's Flat, where construction of the mill is under way. Machinery is being set up. While it is the ultimate intention of Manager Crowther to put in an electrical plant, this work will not be undertaken at present. A water wheel will be put in at the mill. More energy than required will be obtained through the use of about one-third of the water to which the company has secured title in Little Cottonwood creek. A contract for the aerial tramway to be installed is under consideration.

At the Galena mine, in Bingham, the management of the United States M. Co. reports progress in development. A drift is being run along the strike of the new vein on the fourth level. While this work is going ahead, other men are running a crosscut to the Galena vein. The aerial tramway, 1656 feet in length, is being installed, and Superintendent Allen

says it will be ready for operation November 1.

The Queen mill at Bingham, with which the Butterfield M. Co. is concentrating low-grade ore, is reducing 100 tons daily under direction of F. Whitmore. The work is on ores with average of 8% lead, fifteen ounces in silver, with gold. Ores are blocked out in the mine. The mill is equipped with two tables, three vanners and five jigs. The middlings are returned to the battery bins, where they are resorted to a 14-mesh, and the result is said to be satisfactory.

### Summit County.

The Ontario drain tunnel will be extended into Daly-West territory, contracts for which have been signed by the Ontario Co. and by the Daly Co., says Manager J. E. Bamberger of the Daly-West. The Daly-West is to pay the Ontario and Daly companies, the tunnel being owned jointly by them, an annual rental of \$9000. The tunnel will be extended by the owners to the easterly end lines of the Daly-West territory without cost to the latter and then the Daly-West Co. will take up the work and pay the cost of driving in its own ground. The contract also provides that if the Daly-West wants to mine through the tunnel it shall have the privilege. It is said it costs the Ontario and Daly companies \$5000 per year to keep the tunnel open and in repair; that it cost \$1,000,000 to build it; and that the extension of the tunnel will open and drain the Daly-West mine at an additional depth of 600 feet vertical and about 900 feet on the dip of its ledges. Driving the tunnel will be started this week by Manager C. L. Rood of the Ontario and Daly companies. There are between 700 and 800 feet to run to reach the western limits of Daly ground.

The men have been withdrawn from the upper workings in the Quincy ledge, in Daly-West ground, says Vice-President Wood, as the management has suspended production from that source until connection is made through an opening advancing from the Daly-West workings proper. This will overcome the expense of hoisting and hauling the output from the Quincy ledge around the hill.

Work has been discontinued for the winter at the Lone Pine mines in Snake Creek district, near Park City. The tunnel is in 150 feet.—The Lubeck mill in Empire canyon is grinding steadily. The mill is equipped with a revolving screen and a concentrating table, power being furnished by a water wheel, which utilizes the flow of water from the creek on which the plant is built.—Retimbering of the Hanauer tunnel (the Kearns-Keith) is complete, the new track and rails have been laid and everything is in readiness for the mine locomotive. The boilers at the mill are in place. A compressor has also been set up.—Mules have been put on the 1400-foot level of the Daly-West mine for handling the ore trains.

### Tooele County.

G. St. Clair, operating on Lion Hill, near Mercur, says plans are made for remodeling the Chloride Point mill in which it is proposed to treat the low-grade ore of the property. Meanwhile they are also arranging for development of a new group of claims underlying the Zella. It is intended to drive a tunnel into the group to tap the ledge at depth.

That the gold-bearing ore opened up in Herschel ground through an opening from the Sacramento workings may be provided with an independent outlet, says Manager J. Smith, the management will begin driving a tunnel connection with the ore bodies to be made at a point between 400 and 500 feet from its mouth. The mine will be equipped with a mill after the tunnel is completed. Sampling of the ore bodies shows an average of \$5 gold per ton.

### Washington County.

C. H. Doolittle, manager of the Utah & Eastern M. Co. properties, consisting of the Dixie mines and smelters near St. George, says connection will be made through the main shaft with the main ore body this month, when he will be able to double the output. On the lower levels are exposed ores of good grade. The smelter equipment will be increased.

## WASHINGTON.

### Ferry County.

S. R. Delbridge of Seattle, manager of the Oversight M. & M. Co., says operations will be resumed in the Oversight mine on Belcher mountain, near Republic. He will complete a tunnel driven last year toward a shaft, in which there is ore of paying value, and hoist the ore and ship it to the smelter. It is said to carry \$15 a ton in gold.

### Okanogan County.

H. Barbs, manager of the Copper World Extension M. Co. of Loomis, says he will increase development on the Copper

World Extension group, which adjoins the Palmer Mt. Tunnel Co. mines. He will sink a shaft 500 feet and open up levels. The Palmer Mt. Tunnel Co. will put in an electric plant this fall, to continue the Palmer Mountain tunnel into the Copper World Extension ground. The distance the tunnel is to be extended is 5000 feet, and the depth to be gained is 4000 feet below the summit of the mountain. The Palmer Mt. Tunnel Co. will defray all expenses and the Copper World Extension Co. will take out ore from its own ground, run it through the tunnel and pay a royalty for the privilege. Barbs says the shaft will have two compartments for hoisting and another compartment for manway and pump line.

A ventilating plant has been put in and is operating with water taken from a tunnel of the mine, says S. E. Barron of Spokane, president of the Q. S. G. M. & S. Co. This fall they will put in an air compressor and six machine drills. The main tunnel is in 900 feet, and has cut three ore-bearing veins. The values are copper and gold. The ledge is 400 feet in width and runs \$5 per ton. It is intended to eventually install a smelter. There is yet a great deal of development work to be done. The property of the Q. S. company embraces fourteen claims, 11 miles from Conconully.

### Stevens County.

The Roselle M. Co. has been incorporated by J. B. Moseley, W. S. Thyne, A. Schulze, H. M. Moseley and G. Schulze at Spokane, to develop a section of mineral land on both sides of Cottonwood creek in center of the Colville Indian reservation, near Colville.

## WYOMING.

### Carbon County.

The smelting works of the North American C. Co. at Encampment have increased their output until 41,000 pounds of blister copper, 99% pure, is being turned out daily, or a total of 7482 tons a year. The value of the output is \$1,795,800, which is said to be largely profit, as after smelting and converting the ore runs \$20 per ton in gold, sufficient to pay for the cost of smelting. The North American C. Co. is composed of Colorado men headed by J. S. Cary of Denver.

### Laramie County.

J. J. Hauphoff of Hartville says he will open up and develop his onyx and marble mines near Hartville. A \$10,000 plant of machinery will be installed for quarrying the product and a polishing factory will be built.

## FOREIGN.

### AUSTRALIA.

#### Queen Island.

The report of the Mount Morgan G. M. Co., Ltd., operating at Mount Morgan, for the year ended May 31 last, shows:

Gold produced.....	\$467,428
Copper produced.....	15,485
Interest, etc.....	3,221
Total.....	\$486,134

Mine and reduction costs.....	\$318,797
Leases.....	730
Railroad charges.....	6,993
Royalties.....	5,274
Total.....	\$331,794

A total of 686,770 tons of rock was handled during the year, divided as follows:

Material.	Tons Underground.	Tons From Open Cut.
Oxidized ore.....	416	118,139
Sulphide ore.....	117,523	.....
Copper-gold ore.....	3,466	.....
Sulphur ore.....	1,147	.....
Limestone.....	153	.....
Waste rock.....	16,702	122,599
Overburden.....	.....	305,625
Totals.....	139,407	547,363

Steam shovels were used to remove 219,105 tons of the overburden, the balance being handled by contract. Mine manager says development included 1058 feet of sinking, 2274 feet driving, 10,135 feet diamond drilling. There are three diamond drills in steady operation. The steam shovel plant consists of one 65-ton Bucyrus shovel, two 10-ton locomotives and 20 side-dumping cars of 4 cubic yards capacity. A shovel of 10-ton lift and another locomotive, with cars, will be added to the equipment. "Exploratory work has been carried on almost entirely by diamond drilling." The reduction works treated 118,906 tons sulphide ore, 118,555 tons oxidized ore and 30,794 tons tailings, producing 122,252 ounces bullion carrying 109,903 ounces fine gold. There were 157 tons of copper matte produced containing 75 tons copper and 1794 ounces gold. Treatment costs were:

	Per Ton.
Sulphide ore at Mundic works.....	\$3.20
Oxidized ore at West works.....	3.44

These show decrease of 44 and 37 cents per ton, respectively, from costs of previous year.

## BRITISH COLUMBIA.

## Boundary District.

Men are working at the Lancashire Lass mine, in Summit camp, which has been bonded by the Montreal & Boston C. Co. The ore dump of the Brooklyn mine has been sold to the Montreal & Boston Co. by the Dominion C. Co., but it is to be delivered by the latter company at the smelter.—The Greenwood-Strathmore Mines, Ltd., is being formed to operate the Strathmore claim, near the Providence, which has been bonded. S. Curtis of Rossland is interested.

Diamond drilling operations are under way at the 300-foot level of the Old Ironsides mine, at Phoenix, to decide on the best point at which to sink.

The head office of the Granby M., S. & P. Co., operating at Phoenix and Grand Forks, has been transferred from Montreal to Grand Forks, control having been sold to Boston, Mass., and New York men. The annual report shows the amount received from production for the past year was \$2,948,551, and from rents and land sales \$17,795, or a total of \$2,966,347. Against this there was working expenses of \$1,814,216, and the cost of foreign ore and matter \$868,619, making a total of \$2,682,835, leaving net profits for the year \$283,500.

The Athelstan-Jackpot mine, in Wellington camp, is sending out a car of ore daily.—Development on the Silver Cloud and the Silver King mines, adjoining each other in Skylark camp, is showing ore values.—Work has been started on the Last Chance mine, which has been idle for five years. It is owned by the Spokane-Boundary M. Co. The work is in charge of D. W. McVicker. The Last Chance has machinery equipment. It is 2 miles from Phoenix, toward Greenwood, and it is said that a long tunnel will be driven to strike the ore body at depth.

At Phoenix the Snowshoe's machinery in the compressor building has been overhauled, says Managing Director A. J. McMillan. The Snowshoe ceased operations Dec. 16th last, after shipping 100,000 tons of ore. It has a machinery plant, including an electric hoist.

## East Kootenay District.

The waters of Perry creek have been turned into the flume of the Perry Creek Hydraulic M. Co., near Fort Steele. For three years the company has been prospecting the ground and equipping with flumes, pipe lines and monitors. Roads, trails, tramways and sawmills have been built and mining operations begun. The ground to be piped away is a ridge above the bed of the present stream and at the falls of Perry creek. From the bottom to the top of the ridge is 600 feet. All the water of Perry creek has been brought to the top of this ridge by flume and pipe line 5 miles long. Two monitors are set up and connected.

## Rossland District.

Placer mining operations have been started by P. H. Craven of Rossland on the west bank of the Columbia river. He has a 100-ton plant in operation and has taken up placer locations on the Columbia about 2 miles down the river from Waterloo. Water for sluicing is being pumped from the river, and the same power runs the amalgamator. A steam engine is used. At present Craven relies on the plates to secure all the gold, but later riffles will be placed in the sluice boxes and another plant put in, including an arrastra. The gravel is said to average 40 cents per yard. Craven reports handling the material at 15 cents a yard. The gravel bed is 30 feet in depth. Water is pumped against the face of the gravel bed, the boxes being kept continuously against the gravel. This brings the material steadily down the sluice and over the plates, where the gold is amalgamated. Much of the values is in fine or flour gold.

## Slocan District.

(Special Correspondence).—At a time when zinc is worth 5 cents per pound, as against 2½ cents which the British Columbia miners receive for their lead, it is encouraging to see that the Kootenay districts of British Columbia are not continuing to remain unmindful of their deposits of high-grade zinc. The Lucky Jim mine, near Sandon, has completed shipment to the sampling works of the Kootenay Ore Co. at Kaslo of 1000 tons of zinc ore, which has been sampled in four lots of 250 tons each, giving results of between 50% and 60% zinc. The Slocan Star and the Ruth at Sandon and the Jackson mines have adapted their concentrators to turning out separate products of zinc and lead concentrates, and the first two have large piles of zinc concentrates awaiting further treatment of magnetic separation by which the zinc contents can be raised to 50% or over. To supply the want for this process the Kootenay Ore Co. is adding to its sampling works at Kaslo a zinc separation

plant, and which will be in operation when the concentrators resume work next spring. At Rosebery, on Slocan lake, a similar plant is being built by C. Fernau to handle the zinc concentrates of that district.

Kaslo, Oct. 16.

M. S. Logan of Nelson has an option on the Mountain Con. mine, near Slocan City, for \$55,000.—A lease and bond on the Cowboy and Texas groups, on Spring creek, have been taken by H. Newcomb, D. W. Moore and J. A. Whittier and work started. The amount of the bond was \$20,000.

At Sandon there are seventy men working at the Ivanhoe mine.—The Jackson concentrator is being overhauled.—The Slocan Boy mine at McGuigan has been leased to R. H. Gordon et al.—The Slocan Star mill at Sandon has closed down owing to a lack of water.—A. Peterson has a lease on the Ontario mine, near Cody.—Work is being resumed in the old workings of the Surprise mine at McGuigan.

W. W. Van Baun of Philadelphia, Pa., part owner of the Rockland group of copper claims, near Silverton, on Slocan lake, says development work has been started and the properties will be equipped.

At Sandon the Slocan Star mine has 3000 tons of zinc ore at the concentrator for treatment at the Rosebery plant.—G. W. Hughes is taking out zinc from the Lucky Jim and testing it at the Kaslo sampler. He has thirty carloads ready to ship. A strike of galena was made last week.—W. J. Richards and J. Williams, lessees of the Joe Joe, have started another tunnel 100 feet lower down the hill to tap the gold-bearing vein. They have put on more men. They have 300 sacks of ore piled up, and will make a shipment this week.

## West Kootenay District.

At Camborne, the Silver Dollar Co. reports opening up ore. An air compressor plant and a sawmill are being put in.

## MEXICO.

## Chihuahua.

H. E. Cary and R. J. Coleman of Salt Lake City, Utah, have completed a 20-stamp mill at the Lluvia de Oro mine in Chihuahua, near Choix, Sinaloa.

## Lower California.

E. Borton and F. Aguilar of Nogales, Ariz., who have been engaged in placer mining on the concession owned by C. Ramirez, report they will organize a company to put in heavy pumping machinery, a pipe line, etc., and proceed to hydraulic operations.

## Sonora.

The Missouri-Mexican M. Co., T. W. Foster manager, which has properties at Todos Santos camp, near Suaqui de Batuc, will increase development this winter. The shaft will be sunk to 300 feet and a tunnel run 250 feet on an ore body assaying 400 ounces silver on the surface. Todos Santos is an antigua camp.

The Ures Con. M. Co., has contracted with the Vega M. Co., operating the San Jose mine, an adjacent property, to treat the ores from the latter mine, and the mill is now running on that rock while the Ures Con. Co. is sinking its shaft from 340 feet to 540 feet and drifting.

Assistant Manager T. M. Carson, of an English company operating a group of gold mines near Alamos, says a reduction plant will be built by the company.

## Obituary.

B. N. HILLARD, a mine owner and operator of Idaho, died at Lakeview, Idaho, on the 19th inst.

JOHN GEORGE, a pioneer miner of Placer and Shasta counties, Cal., died at Redding, Cal., on the 11th inst., aged 77 years.

J. T. FILCHER, a pioneer miner and mine operator of Montana, died at Boulder, Mont., on the 7th inst., aged 67 years. Deceased was interested in the High Ore mine in Jefferson county.

R. SILER, a pioneer miner of California, a native of Mount Vernon, Ohio, aged 73 years, died on the 11th instant at Hungarian Hill, near Quincy, Plumas county, Cal. He was a pioneer of Nevada and Yuba counties and went to California in 1850.

W. M. LENT, a pioneer mine owner and operator of California, and on the Comstock in Nevada, died at San Francisco, Cal., on the 17th inst. Deceased was born in New York eighty-six years ago. In the late fifties he was a member of the California Legislature. He was interested in the Central, Mexican, Savage, Bullion and Yellow Jacket mines on the Comstock.

## Personal.

T. CORNISH is manager for the Nevada G. M. & M. Co., Central City, Colo.

M. F. LYNCH has resigned as superintendent of the Reveille mine at Reveille, Nev.

A. P. HODGSON has been appointed assayer in the United States mint at Denver, Colo.

C. H. NAZRO is superintendent of the Weyant M. Co. at Pollock, Idaho county, Idaho.

R. KAHLOW is superintendent of the Big Comstock mine of the Columbia M. Co., near Pitkin, Colo.

F. M. DOWNER has been appointed superintendent of the new United States mint at Denver, Colo.

T. W. MACK, of Dayton, Nev., is in Guadalajara, Jalisco, Mex., where he has charge of mining interests.

W. H. HAMPTON is manager of the Jualpa M. Co., of Philadelphia, Pa., operating near Juneau, Alaska.

G. V. MICHELL is managing placer mining operations at Campamento, Department of Olancho, Honduras.

W. A. CUNNINGHAM is superintendent of the Helen group of mines in Twin Lakes district, near Leadville, Colo.

C. B. GAMMON of Carthage, Mo., is superintendent of the Opal Wonder M. Co., operating in the Webb City district.

H. KLING of Quincy, Cal., is superintendent of the Pilot Peak drift mine, near Gibsonville, Plumas county, Cal.

D. W. MCVICKER is superintendent of the Last Chance mine of the Spokane-Boundary M. Co., near Phoenix, B. C.

J. E. BAMBERGER of Salt Lake City, Utah, has resigned as manager of the Daly-West M. Co. of Park City, Utah.

R. P. COLEMAN of Denver, Colo., is on the engineering staff of the Lindsay Cananea Center M. Co. at Cananea, Sonora, Mex.

H. J. GRANT is manager of the Cosmopolitan Proprietary mine at Kookynie, in North Coolgardie district, Western Australia.

A. B. MEDWORTH is manager of the Preston-Buchanan G. M. & D. Syndicate of Cape Town, South Africa, operating African mines.

E. LUND, a southern California mining engineer, has removed to Darwin, Inyo county, Cal., south of Keeler, and will engage in mining there.

C. BASKERVILLE, recently with the University of North Carolina, is professor of chemistry at the City College of New York, New York City.

W. M. KNOX, who has been testing for gold dredging ground at Gas Point, Shasta county, Cal., is now at Oroville, in the same line of work.

J. HARRINGTON, until recently superintendent of the Quincy mine at Park City, Utah, has gone to Bellevue, Idaho, to take charge of the Galena mine.

E. BAMBERGER, who has been assistant manager of the Daly-West M. Co. of Park City, Utah, is manager of same company, vice J. E. Bamberger resigned.

J. A. KIRBY has resigned as superintendent of the Daly-West Co., at Park City, Utah, and will in the future serve as consulting engineer for that company.

H. E. NICHOLLS is manager of the Malaysian Co., operating hydraulic gold mines at Sepan, near Lipis, in Pahang, Malay Peninsula, vice R. M. W. Swan deceased.

H. H. KIRKPATRICK, recently at Illinois University, is instructor in civil engineering, Syracuse University, at Syracuse, N. Y., vice O. M. Jones resigned.

J. A. McCASKELL, who has been assistant superintendent of the Daly-West M. Co., at Park City, Utah, has been appointed general superintendent, vice J. A. Kirby, resigned.

T. H. LEGGETT, expert for the Vilorio Syndicate, Ltd., London, England, is at Oroville, Cal., inspecting progress of work on the new 5-foot Bucyrus gold dredger.

O. M. JONES, recently instructor in civil engineering, Syracuse University, Syracuse, N. Y., is head professor of civil engineering in Tulane University, at New Orleans, La.

J. CARTER, recently superintendent of

the Cedar Valley M. Co., near Kingman, Ariz., has gone to Florence, Final county, Ariz., to have charge of operations of the Fletcher M. Co.

G. B. CHURCH, who formerly represented the Montana-Tonopah M. Co., at Reno, Nev., is superintendent of the Reveille mine at Reveille, Nev., vice M. F. Lynch, resigned.

E. E. F. CREIGHTON, recently in the service of the General Electric Co., has been appointed assistant professor of electrical engineering in Union College, at Schenectady, N. Y.

F. LYON, civil and mechanical engineer for the United States M. Co. of Salt Lake City, Utah, is at the Mammoth copper mine of the company near Kennett, Cal., to remain for several months.

J. C. OSGOOD of Oroville, Cal., with the W. P. Hammon Dredging Co., has been transferred to Marysville to take charge of the office of the company, operating at Daguerre Point, on the Yuba river.

G. A. LAIRD, formerly superintendent of the Victoria mines at Cerro de San Pedro, San Luis Potosi, Mex., is superintendent of the Sierra de Cobre mines of Phelps-Dodge Co., near Cananea, Sonora, Mex.

I. MCKAY, formerly of Park City, Utah, but late of Tonopah, Nev., has been appointed general superintendent of the Goldfield and the Adams-Goldfield Mining Companies at Goldfield, Esmeralda county, Nev.

F. A. THOMPSON, manager of the plant of the Western Reduction Co., at Forks Creek, Jefferson county, Colo., has also been put in charge of the Missouri mine, at Russell Gulch, in Gilpin county, Colo., for the same company.

A. M. McDONALD has resigned as superintendent of the Ida Mitchell mine, Placerville, Cal., and has accepted a position with the Debris Commission as chief engineer and U. S. deputy marshal, with headquarters at San Francisco, Cal.

## Books Received.

"Geology Applied to Mining," by J. E. Spurr, published by the Engineering and Mining Journal, presents a comprehensive yet simple study of those geological principles that are necessary for the understanding of ore deposits. The principles are stated so that all can understand them; their application to mining is intelligible to any mining man. The book also gives a brief account of those principles of historical geology and petrography that are of practical use. The author first gives an account of the general theory of sedimentation, concluding this by a study of bedded deposits. He then shows how ore bodies are formed, laying stress on the influence of igneous rocks, the latter being well classified and described. In the part devoted to the study of dynamic and structural geology is given a general description of earth movements and their effect on ore bodies. The chapters on placer deposits are good. The chemical work of water is fully treated, and the book is completed by a chapter on the relation of physiography to mining. The illustrations and examples are new, typical and well chosen to show the application of principles to actual occurrences. Some unnecessary repetition and redundancy is caused by the arrangement of the matter as a series of questions and answers. The book would be made more compact if these questions were omitted. It will be valuable alike to the prospector on the surface and the expert tracing lost veins underground. The book is bound in cloth and will be sent postpaid from this office on receipt of price, \$1.50.

## Trade Treatises.

Special Catalogue No. 100, from the Crane Co., contains 94 large pages of information regarding their pop safety valves, water relief, cylinder relief, snifting and hydraulic relief valves and boiler trimmings.

Bulletin No. 6 of the Mine & Smelter Supply Co. gives a good general description of the new No. 5 Wilfley concentrator, finely illustrated. The pamphlet also gives in detail the erection and operation of the table. It can be had on application to any of the Mine & Smelter Supply Co.'s offices—Denver, Colo.; Salt Lake City, Utah; El Paso, Texas; 139 Liberty St., New York; City of Mexico, Mexico.

"On the Track" is the title of a hand-

some booklet illustrating and setting forth the value and practical worth of narrow gauge railway material. It comprises everything that enters into the construction and requirements of such a narrow gauge railway as might be required by a mining engineer. The book will be sent to any address on request by Arthur Koppel, 66-68 Broad street, New York City.

## Commercial Paragraphs.

**COLORADO IRON WORKS Co.** of Denver, Colo., report sales of three sets of their improved standard (36x16 inches) wide faced crushing rolls to the Montana Zinc Co. in Montana, and a 36-inch copper matting furnace to the Traylor Engineering Works, New York. Two carloads of machinery for the El Cobre Mining Co. in Cuba left the works this week.

The Galena Iron Works at Galena, Ill., are furnishing most of the machinery and equipment for the rapidly developing lead and zinc district about Galena, Ill., and Platteville, Wis. They have brought out a process for magnetic separation, adapted to ore bearing pyrites of iron. C. C. Mathey is president and E. W. Moore manager of the company.

**KILBOURNE & CLARK Co.** of Seattle, Wash., and San Francisco, Cal., have been appointed representatives for the Stromberg-Carlson Telephone Manufacturing Co. Their territory includes Oregon, Washington, Idaho and northern California. B. F. Kierliff, Jr., & Co. of Los Angeles, Cal., have also been appointed representatives for that company for the territory embraced by Arizona, Nevada and southern California.

**CARY BROS.**, formerly with the Mine & Smelter Supply Co., Denver, Colo., have secured the selling agency for the United States for the Shaw eclipse air hammer rock drill. This drill has been on the market for some time past and the reports received from it are encouraging. They have offices at 432 Equitable Building, Denver, Colo. The Shaw Drill & Machinery Co., Ltd., London, E. C., 7 to 11 Moorgate street, are sales agents for all foreign countries.

The Power & Mining Machinery Co. has closed a contract with J. E. Hooper of Baltimore, Md., for a 25x30, two-cylinder engine and two No. 8 suction producers for his new cotton mill at Woodberry, Baltimore. It will have three rope pulleys for driving to the floors of the mill, and the shaft will be extended for a flanged coupling, so that another 25x30, two-cylinder engine can be installed at a later date, it being Mr. Hooper's intention to double the mill after the first half is in operation. "This," say the manufacturers, "is the first installation that we know of for cotton mill work. The order was obtained after a very thorough investigation on the part of Mr. Hooper and his engineer, C. C. Hedrick, of the Lowell Machine Co."

The following telegram is received: "Allis-Chalmers-Bullock swept the field; won the highest awards St. Louis Exposition, the grand prize in every department, steam engines, electricity, and mining machinery; also gold medal for Bullock system of operating variable speed electric motors for driving machinery. One grand prize was for the Allis-Chalmers (Big Reliable) engine, the largest ever seen on exhibition. Another grand prize was for our Bullock electric generator, these two machines comprising the high unit which supplies the world famous decorative lighting, and much of the power at the St. Louis Exposition. Another grand prize was for our exhibit in the Department of Mines and Metallurgy. There is nothing left to be won. We have taken everything."

The Wellman-Seaver-Morgan Co., Cleveland, Ohio, has been awarded by the board of trustees of the sanitary district of Chicago the contract for the turbine water wheel equipment for the new power house of the Chicago drainage canal. This is the second largest installation of water power equipment contracted for in the United States—the largest single water power equipment previously contracted for being the one, also built by the Wellman-Seaver-Morgan Co., at Sault Ste. Marie, Michigan, for the mammoth power house of the Lake Superior Power Co., and to consist when completed of 50,000 H. P. The Chicago drainage canal power station is to be located near Joliet. The equipment will comprise four 6000 H. P. units of turbine wheels, which will be direct connected to electric generators. There are also two exciter units of 600 H. P. each included in the contract, which will require one year for completion.

## Latest Market Reports.

SAN FRANCISCO, October 21, 1904.

### METALS.

**SILVER.**—Per oz., Troy: London, 26½d (standard ounce, 925 fine); New York, bar silver, 58½c, refined (1000 fine); San Francisco, 58½c; Mexican dollars, 47c San Francisco, 46½c New York.

**COPPER.**—New York: Standard, \$13.25; Lake, 1 to 3 casks, \$13.37½; Electrolytic, 1 to 3 casks, \$13.10; Casting, 1 to 3 casks, \$13.25; San Francisco: \$15.00. Mill copper plates, \$17.00; bars, 18@24c. London: £61 1s 6d spot per ton.

Following are the figures of the German consumption of foreign copper for the months January-August, 1904, as compared with the same period of time in 1903-1902:

	1904.	1903.	1902.
Import, tons.....	74,482	56,094	54,643
Export, tons.....	5,610	6,964	6,118

Consumption, tons. 68,872 49,130 48,525  
Of the total imports this year 62,165 tons came from the United States, against 41,475 tons last year.

**LEAD.**—New York, \$4.35; Salt Lake City, \$3.50; St. Louis, \$4.12½; San Francisco, \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½c; pig, \$4.85. London: £12 5s 6d long ton.

**SPELTER.**—New York, \$5.25; St. Louis, \$5.00; London, £23 20s 3d ton; San Francisco, ton lots, 6½c; 100-lb. lots, 7c.

**TIN.**—New York, pig, \$28.75@29.00; San Francisco, ton lots, 29c; 500 lbs., 29½c; 200 lbs., 30c; less, 31c; bar tin, 32½@35c. London, £132 spot.

**PLATINUM.**—San Francisco, crude, \$18.50 ½ oz.; New York, ingot, \$19.00 Troy oz. Platinum ware, 75 @ 82c ½ gram.

**QUICKSILVER.**—New York, \$42.00@44.00, large lots; London, £7 15s San Francisco, local, \$41.50@42.50 ½ flask of 75 lbs.; Denver, \$45.00. Export, \$41.50@42.50.

**BABBITT METAL.**—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 31½c; Eclipse, 35c.

**SOLDER.**—Half-and-half, 100-lb. lots, 19c; San Francisco, Plumbers', 100 lb. lots, 16c.

**ZINC.**—Metallic, chemically pure, ½ lb., 50c; dust, ½ lb., 10c; sulphate, ½ lb., .04c.

**NICKEL.**—New York, 40@47c ½ lb.; ton lots, 40@47c.

**ALUMINUM.**—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 31@34c.

### STRUCTURAL MATERIALS.
